These various activities for the benefit of children are taken into consideration in "substantive grants" by the Board of Education to local authorities. The evening play centres, initiated by Mrs. Humphry Ward, and largely supported by voluntary contributions, since 1918 have been eligible for such grants. Submission of arrangements (see Education Act 1918, and Ministry of Health Act 1919) are made by each local authority to the Board or Ministry concerned. Medical records are kept, school clinics and feeding centres are provided, as are special schools for the deaf and blind who must be kept completely separate, and the mentally deficient and epileptic. The necessity of beginning the training between the ages of two and five is insisted on by the Board. The curriculum for each class of child, building regulations, rules as to grants regulation for special schools and boarding-houses will be found in the appendices to the consolidated regulations. The Elementary Education Defective and Epileptic Children Acts 1899–1914 make it a duty of the local authority to provide for their education, and make it incumbent on the parent of such a child over seven to make suitable provision for its education or to send it to a certified school.

Affiliation (see 1.300).—The maximum payment obtainable from the father of an illegitimate child was in 1921 increased to 10s. per week, to be collected by an officer of the court.

Adoption.—In 1921 the Report of the Committee appointed by the Home Office was published (Cmd. 1254). It recommends: —(1) that adoption of children should be made a legal and enforceable act, the adopting parents having the rights of natural parents; (2) that the county court as well as high court should have jurisdiction; (3) that subsequent marriage should legitimatize any children previously born.

For the law as to custody and guardianship of children, *see* WOMEN, LEGAL STATUS OF. (R. TH.)

UNITED STATES

There was a distinct advance in regard to the care of children, legislative and otherwise, in the United States during the decade 1910–20. In 1912 the Federal Children's Bureau was established by Act of Congress as a division of what was then the Department of Commerce and Labor. The Bureau was made a part of the Department of Labor when the latter was created in 1913. The Bureau was directed by statute to investigate all matters pertaining to the welfare of children and child life, and especially the questions of infant mortality, the diseases of children, juvenile courts, abandonment, and the employment of children in dangerous and other occupations. Miss Julia C. Lathrop (b. 1858), chief of the Children's Bureau from its establishment, was responsible for its success in scientific research and in coöperating with national societies and local public and private agencies in the advancement of the interests of children.

Children's Codes.—The new movement for "children's codes" took form in 1911, when Ohio was the first state to create an official Children's Code Commission to "revise, consolidate and suggest amendments" to the laws of the state pertaining to children. As a result of the work of this commission, a children's code was adopted by Ohio in 1913. By 1921, 24 states had followed the example by appointing official bodies to codify laws and to recommend legislation in the field of child welfare. Special attention was given by these commissions to the laws with reference to dependent, delinquent and defective children. The legislation which was adopted after the report of the Minnesota Commission in 1917 made Minnesota a leading state in the public protection and care of children. Here, as in seven other states, the work is centralized in a special division, a state board of control or whatever state department has general oversight of the state's wards.

Illegitimacy.—There has been some discussion in recent years of the legal position of children born out of wedlock. Most of the American states adopted laws which made the issue of certain annulled marriages legitimate, followed the civil-law principle of legitimation by subsequent matrimony, and created rights of inter-state succession between the illegitimate child and the mother. Bastardy support legislation in America has followed English lines. According to Prof. Ernst Freund, of the university of Chicago, the most striking feature of this legislation has been its stationary character, indicative of a lack of thought with reference to the subject during the past century. This stagnation appears to have come to an end in the last few years. In 1917 liberal laws were adopted in the states of Minnesota and North Dakota. The Minnesota law provides that the state Board of Control shall look after the interests of the illegitimate child so that he may have approximately the same advantages as the legitimate child. To do this the Board may initiate proceedings to establish the parentage and rights of the child, may coöperate with child-aiding organizations, and, when requested to do so, may appoint a county child-welfare board, two members of which shall be women, to aid in the objects of the state Board; if there is no county welfare board, the judge of the juvenile court may appoint local agents to

coöperate with the state Board. The abandonment statute is made applicable to illegitimate as well as to legitimate children. North Dakota has by legislation declared every child born out of wedlock to be legitimate and entitled to support and to education as though born in lawful wedlock. An illegitimate child born in a maternity hospital is given the surname of the father if known. The North Dakota law does not, however, provide means for overcoming some disadvantages from which children born out of wedlock suffer and which the law declares are abolished. In 1919 regional conferences with reference to the problems of illegitimacy, held under the auspices of the U.S. Children's Bureau, agreed upon principles with reference to the illegitimacy problem which should be recommended to legislatures; in Aug. 1920, the National Conference of Commissioners on Uniform State Laws appointed a committee to consider legislation in this field and to prepare a model law which might be adapted by the various states to local conditions. The ground was thus well prepared for legislation.

Dependent Children.—Massachusetts did the first important work in boarding the state's dependent children in family homes instead of in institutions for children. Since the White House Conference on the Care of Dependent Children in 1909 there has been a growing recognition by both private and public agencies of the importance of providing, for children who must be removed from their own homes, home life as nearly normal as possible.

Although there had been an increase in institutional provision for the feeble-minded, facilities for the custody and training of the subnormal were in 1920 still inadequate in all states. A special commission in Massachusetts relative to the control, custody and treatment of defectives, criminals and misdemeanants reported to the Legislature in 1919. As a result of its recommendations laws were passed in Massachusetts providing for a census of retarded school-children, the establishment of special classes in the public schools for such children, and the registration of the feeble-minded by a Commission on Mental Diseases. By 1921 similar legislation had been adopted or was under consideration in a number of states.

Juvenile Courts.—Since the first fundamental modification of court procedure relating to children was made in Illinois in 1899, every state, except Connecticut, Maine and Wyoming, has adopted so-called "juvenile-court" laws. This legislation has been fitted into the local judicial systems, so that there are many differences not only between states but in different parts of the same state. A questionnaire study of the courts in the United States hearing children's cases, made by the U.S. Children's Bureau for the year 1918, showed 2,391 courts organized under these statutes; 1,269 of them reported a total of 140,252 cases heard during the year, including 79,946 cases of juvenile delinquency heard in 1,088 of these courts; 37,387 cases of neglect and dependency were reported by 791 courts. From the replies received, the Bureau estimated that the number of children's cases heard annually in the juvenile courts of the United States approximates 175,000. The constitutionality of laws creating juvenile courts and certain general principles on which they must operate have been generally established; separate hearings, informal or chancery procedure, professional probation officers for investigation and supervisory care, detention of children separate from adults, and a system of recording and filing the social as well as the legal history of each case are now recognized as necessary. During the years 1910–20 attention was centred on the working-out of these principles in actual practice. As a result there was an extension and improvement of the probation service (every state except Wyoming had in 1921 legislative provision for juvenile probation); better methods were developed for gathering and recording social as well as legal facts, and coöperation with other agencies was increasingly effective. The practice in many places still fell far short, however, of the idea.

Miscellaneous.—Certain significant tendencies of the decade 1910–20 may be noted:—

(1) Provision for "mothers'" or "widows'" pensions or "funds for parents," in order that dependent children may be cared for in their own homes.—The first two laws of this type were adopted almost simultaneously in Illinois and Missouri in 1911. In Illinois the legislation was sought by Judge Merritt W. Pinckney, of the Juvenile Court of Cook County (Chicago). He was moved to do this by the large number of children for whom dependency petitions were filed solely because, in his opinion, their fathers were dead or incapacitated. In 1920, 40 states and the territories of Alaska and Hawaii had passed what came to be known generally as "mothers' pension" laws. Such opposition as there was to these laws came from private relief agencies which believed, because of the general failure of public outdoor relief, that the laws would never be well administered by a public agency. In 18 states, among them Colorado, Illinois, Minnesota, Ohio and Wisconsin, the administration of these laws was lodged in the juvenile courts and has involved a great increase in the work of those courts. Contrary to the fears of many, the standard of work done in the administration of the mothers' pension laws by the Chicago and other courts was generally equal to that of the better private agencies in the same communities.

(2) Provision for medical and psychological examinations.—The recognition of the physical condition of the child as a factor in delinquency came first. In 1921 23 courts, all but three in large cities, had physicians regularly attached to the courts, while 648 courts had either private practitioners or city or county health officers make physical examinations of the children brought before the juvenile courts. The Juvenile Psychopathic Institute, with Dr. William Healy in charge, began in 1909 under private auspices the study of mental causes of delinquency in the Chicago Juvenile Court. The judge was soon convinced of the importance of having before him the information supplied by psychopathic examination of the children, and Dr. Healy's clinic was therefore taken over by the court. Mental clinics became a part of the court organization in 13 courts; in some the mental examinations being made only in specially difficult cases, or of children suspected of being subnormal. In Boston the Judge Baker Foundation, coöperating with the juvenile court, was (1921) attempting to make a complete physical, mental and social diagnosis of the condition of most of the children who came before the court. The diagnosis was agreed upon and treatment recommended to the judge by the director of the Foundation after a staff conference.

(3) Enlarging the jurisdiction of the court.—The first movement in this direction was to expand the definition of what constituted a delinquent, neglected, or dependent child, so that the court should in no case be prevented, by the lack of technical jurisdiction, from assuming the care of a child. Mothers' pensions have already been referred to. Children's agencies were in 1921 advocating that juvenile courts should be given the trial of adults charged with contributing to the delinquency or dependency of children, of crimes against children, of bastardy actions, and, less generally, of cases of desertion and non-support. The "minimum standards for child welfare," adopted by the Washington and Regional Child Welfare Conferences called by the U.S. Children's Bureau in 1919, recommended that the jurisdiction of the juvenile courts should in all cases be extended to deal with adult sex offenders against children, so that the children may be protected against unnecessary publicity and further corruption in the course of the trial. The question of combining and coördinating the functions of the juvenile courts and the domestic relations courts which have been organized in many places was discussed by probation officers' associations and social workers generally. There was general agreement that the juvenile-court method of investigating, of giving weight to social history and special consideration to the welfare of the children concerned, is needed in the handling of the family problems which come before the courts in connection with desertion, divorce and illegitimacy. There was no such general agreement as to whether these problems should be taken over by the juvenile court or by a family court.

(4) Curtailment of the jurisdiction of the juvenile courts.—Along with the movement to increase the jurisdiction of the court there has been a movement in the opposite direction. Early enthusiasm for the courts has given place to a more critical attitude, and it is now very frequently held that functions have been given the court that could be better performed by other agencies. Child placing and the whole problem of dependency and mothers' pensions are cited as administrative burdens that should not be placed on the courts. Massachusetts, the state in which the probation idea was first developed, does not use its court machinery for either of these tasks, but assigns them to public charitable agencies; in some states, Minnesota being perhaps the best example, elaborate administrative agencies have been developed in coöperation with the courts. School machinery that would make resort to the courts in the truancy cases either unnecessary or less frequent is also advocated.

(5) The appointment of a specially qualified woman to act as referee to hear the cases of delinquent girls and to make recommendations to the judge as to the disposition of the cases is believed to be a forward step. Many states require that a woman, usually a probation officer, must be present at the hearing of delinquent girls. Chicago, Cincinnati, Cleveland, Denver, Los Angeles and Philadelphia have women referees who regularly hear the girls' cases. In D. C. the judge of the juvenile court is a woman.

(6) Extreme decentralization in administrative authority in the various states is responsible for the great diversity often found in the same state under the same law. There is an effort to establish at least minimum administrative standards by increased state supervision or control in connexion with many types of social legislation. Recent investigation has shown it is sorely needed in the juvenile court field, and standardization is being attempted through the probation service. New York and Massachusetts both have had for some time state probation commissions, which exercise general supervision over probation officers. Recent legislation in Alabama and North Carolina goes further in this respect.

CHILD WELFARE.—During 1905–21 the question of Child Welfare became one of continually increasing interest to social reformers.

Before that, the interest in it was mainly from the philanthropic point of view, but the steady decline of the birth-rate in the United Kingdom made it a pressing necessity to endeavour to preserve the vitality of the nation. Though it is true that the efforts to preserve infant life have been in great measure successful, this has not made up, from a population point of view, for the reduction in the number of infants brought into the world; but the most strenuous and successful efforts are being made to minimize the evil. France was in even a more serious condition as regards reduction of population than England and she very early directed her energies towards the encouraging of breast-feeding and the supply of institutions for the supply of good milk known as *gouttes de lait*, a plan which for a time was followed in the United Kingdom. It was about the year 1905, however, that the system which obtains of home visitation, combined with centres for teaching and helping mothers, began to take firm root in England, and, like so many other agencies for social amelioration, it began through voluntary agencies, in which experiments of various kinds could be freely tried. It is to their credit that the work of assisting the mother and child has been developed as it has, and it is on the lines that they started that the work has been followed up. Hampstead, Westminster and other London boroughs set to work in these early days and the records then begun are now proving most useful with the next generation.

Registration of Births.—The necessity for work of this kind depends largely on the keeping of accurate registers, and on their availability. It is only in Great Britain, Germany and France, of European countries, that records of a satisfactory kind can be had. Up to 1837 there were registers of baptisms obtained from churches and chapels, but they were far from complete. After this date registration by the parent was made compulsory within 42 days from birth. This, however, was not sufficient for early visitation of infants and their mother, even could permission to use the registers be obtained. In 1906 Huddersfield obtained parliamentary powers for the compulsory notification of birth to the Medical Officer of Health, and in 1907 a Notification of Births Act was passed which permitted local authorities to adopt a system of compulsory notification, subject to the consent of the Local Government Board. This was given when it was ascertained that the adoption of the Act would be followed by the utilization of the information given by a system of home visitation. When adopted, the birth had to be notified within 36 hours to the Medical Officer of Health for the district. This Act was largely adopted, and it was made to extend to the whole population in 1915 by the Notification of Births Extension Act. This Act took the important step of giving definite power to local authorities of levying rates for infant welfare work. Before it became law, although Exchequer grants became available, many authorities were unwilling to incur expenditure; much voluntary work was, however, being carried on, births being discovered through the lying-in and other hospitals as well as through district visiting. In 1921 home visitation was largely done by the local authorities, more especially in the provinces. In spite of all that was done beforehand, however, notification has been the key to all welfare work, and it is the carrying of it out in respect both of births and infectious diseases that has allowed such work to develop. The World War proved a great incentive to this work by bringing home to Great Britain the need for the preservation of the young population.

Infant Welfare Centres.—The first task has been to coördinate the work at the Infant Centre and the visitation of the mothers in their own homes. The former were often termed "Schools for Mothers," since they specialized in teaching the mothers what was considered necessary for good motherhood. It was soon found that medical advice was required in addition to the usual classes for cookery, garment-making, etc., and that infant consultations were of little use without helping the mothers to carry out the advice given in their own homes. The medical inspection of school-children showed how essential it was that the alarming conditions that were discovered in children of school age should be dealt with before the child came to school, and, indeed, that it was necessary to go back to ante-natal conditions. Some of the advanced health centres had already realized this fact and were carrying on that work. It was brought home to those interested that the work required was preventive far more than curative, and that the whole social condition of the family was involved—the health and habits of the parents, sanitation, and general surroundings. Above all the housing question was, it was felt, intimately bound up with this question. The task was now to link up, so far as might be, the various ameliorative efforts that were being made with the end of bettering the chances for the infant, as well as the agencies for invalid aid, country holidays and so on for the child. It is certainly true that curative work is required as well, but the child welfare movement primarily aims at bringing into the world a healthy population and endeavouring to preserve for it healthy and natural conditions. At the same time it must be in touch with hospitals and other directly curative agencies.

Though every birth may be notified to the Medical Officer of Health, some (about 20%) are not as a rule visited. Visits are usually made about 14 days after birth, since before that time the mother is being attended by a midwife or doctor. A record card is presented in each case, and this has to be carefully filled in. This card is preserved and kept up to date till the child goes to school, when the information it contains is invaluable to the school medical officer.

The "Centre" varies in size from two rooms to many. There are now many large buildings devoted to the work, in which there are not only the waiting rooms and doctor's rooms of the old days, but also a weighing room, toddlers' room, where the older children are looked after while the mother is engaged at classes or otherwise, perambulator shed, and an open-air shed where the children can sleep. Then at a large centre there is a dental room, a pre-natal consulting room, and frequently observation wards, where sickly children can be kept for a time under notice. This involves nurses and servants' accommodation. Sometimes there is also accommodation for mothers. Then a day is often given up for the medical examination of older children under school age. Thus a large centre has become a varied conglomeration of activities, and it probably has small branch centres dependent on it, so that no mother may have more than a short distance (say a mile) to walk. Much stress is laid on the matter of clothing, and every effort is made to obtain the best patterns for the clothing of both infants and mothers and older children and then to get the mothers taught to use them. A system of card-indexing for record is adopted, so that all information is easily available. For the classes (cookery, mending, cutting-out, etc.) a trained teacher is often, and in the large centres usually, employed. In addition, lectures on health matters are given to the mothers as well as to voluntary or other social workers. Ante-natal work brings the welfare work into touch with the work of doctors and midwives (*see* NURSING), and though in some cases it leads to midwives being appointed for the work of the centre, the usual plan is simply to see that the woman in some manner secures adequate and suitable provision for her confinement. If a medical examination is required by a midwife for her patient, although the power to pay doctors' fees was conferred by the Maternity and Child Welfare Act of 1918, the arrangements for providing it are very limited, and the woman therefore often prefers to take advantage of the opportunities offered at the Child Welfare Centre. At these centres nursing mothers are sometimes provided with dinners, though there is a difference of opinion as to the desirability of doing this. Under the Act just quoted these dinners may be paid for from the rates. The provision of milk has also been frequently carried out. The first form of milk used was that which is known as "pasteurized," and it was followed by dried milk, which is often bought wholesale and sold at cost price. The question of how far milk depots are desirable, and

whether they discourage breast-feeding, is still being discussed. The shortage of milk during the World War and its high price made the question acute.

The maternal and infant centre is in some cases provided with a garden where the mothers can sit with their little ones, or where infants may be left to sleep under guardianship while the mother is indoors. Occasionally a play centre for young children is combined with an infant centre. These play centres are instituted in crowded districts for the use of young children. Though they may be acquired and supported by the local authority they are sometimes given by private donors and occasionally equipped by them or by bodies like the Carnegie U. K. Trust. The movement was naturally retarded by the World War and its after effects. In play centres provision is usually made for toddlers, children below five years of age and also separately for older children who can play organized games. A portion of the ground is often covered with asphalt for use in bad weather and a pavilion is provided for storing apparatus and for shelter. There must of course be adequate supervision and possibly an expert instructor. The nature of these developments depends on the size of the ground available and the amount of money that can be spent on it.

The limitation of the legitimate activities of the infant centre has never been defined. Thus, not only does the relationship of the pre-natal work with that of the ordinary midwife come to be a somewhat difficult one, but there arises the further question of what amount of treatment and drugs should be given. In any case it seems clear that it would be wholly unsuitable to convert an infant centre into anything of the nature of a small and expensively run hospital.[1] At the same time there is frequently difficulty in obtaining the hospital treatment suitable for infants and very young children, and certainly no opportunity is given for teaching the mother how to carry on that treatment at home. It has been matter of complaint that the health of children between two and five (school age) has not been cared for sufficiently owing to the dual authority (Public Health Department and Education Authority) which respectively controlled infant welfare and school-children. But under the Ministry of Health the case may be different.

Health Visiting.—The number of visits paid to a mother by a health visitor naturally varies, but about 400 cases are allowed to one visitor, though of course it may be that the visitor is called upon to visit children up to school age, when not nearly so many could be allowed. The visitor is called on to visit all homes where still-births are reported, and it is necessary to report all births taking place after the twenty-eighth week of pregnancy. A certain amount of ante-natal visiting may also be done if the visitor has midwifery qualifications, but this might be regarded as interfering with the work of the midwife or doctor engaged by the mother.

Organization of Child Welfare Work.—The movement has made rapid progress. It was estimated that in 1921 there were in England and Wales 1,754 infant centres, mostly in the hands of municipalities or county councils, though 693 were worked by voluntary agencies.[2] The municipal centres are carried on by the Public Health Committee under the local authority. The county, city or borough council elects its Committee for Public Health, and in 1918, under the Maternity and Child Welfare Act, a statutory committee was made necessary for the purpose of carrying out its requirements, the majority of whose members must be members of the council. Before the 1918 Act these duties fell on the Public Health Committee, though sometimes it devolved them on a sub-committee which might become the statutory Welfare Committee. At least two members of this committee must be women and it has to report to the Public Health Committee. In counties this Welfare Committee is usually a separate one, and is granted considerable power. The staff of visitors work as part of the staff of the department of the Medical Officer of Health. In the towns the visitors endeavour to get the mothers to bring their infants to the centres and in some places half of those visited do so. Of course, not all these children necessarily go before the doctor on each occasion. There are many variations in the manner of working the centre, depending on the nature of the area. In the country the visitors usually undertake the threefold duties of infant, school and tuberculosis visiting. The visitors are usually stationed in small towns or villages within the area and visit around these. "Centres" may or may not be established in these towns or villages. In most counties there are nursing associations for the supply of parish nurse and medicines, and the Education Committee often helps in the training of the nurse. These nurses are sometimes employed as visitors for infant welfare work as well as for school work and occasionally for tuberculosis and are subsidized for such visiting through the association. Of course they must be under the Medical Officer of Health in respect of such work. The superintendent of the county nursing association may also be appointed inspector of midwives for the county. Usually wholetime visitors are employed in the larger towns. It is thought by some that the whole nursing service should be placed under the councils and the voluntary element done away with; others are strongly opposed to such a policy as tending to bureaucracy.

Work of Education Authorities.—It is difficult to consider infant welfare work in Great Britain without taking into consideration also the work of Education Authorities to whom power was granted to carry on the work of medical inspection in 1908. As with infant consultations it was soon found that following up the cases in their own homes was essential if good was to be done, and very often the infant visitor carries out the visiting for both infants and school-children. The Mental Deficiency Act of 1913 also requires county and borough councils to do work which requires visitation. Unless care is taken there is serious danger of overlapping.

Training of Visitors.—The training of infant visitors cannot as yet be said to be standardized. The training of a nurse is useful, but hospital experience alone is not sufficient, any more than is that of midwifery or the sanitary diploma. The Board of Education has now issued a regulation for the training of health visitors which is fairly complete, and includes theoretic training in physiology, hygiene, and social work, as well as practical training in cookery and housewifery, and much work of various kinds at health centres. Voluntary workers with social knowledge and wide experience are of great use. There were in 1920 3,350 health centres in England and Wales, and probably many more will be required.

Day Nurseries and Crèches.—In addition to the recognized infant welfare work, there are numerous day nurseries and crèches which are eligible to receive Government aid. The mothers contribute a proportion of the cost. Nursery schools receive grants from the Board of Education under the Act of 1918 and crèches come under the Ministry of Health. Children up to school age are taken by the former and infants by the latter. During the World War, when married women were working, these institutions were invaluable and, if well conducted, day nurseries form an excellent training ground for young women and girls. An endeavour has been made to obtain a service of "home helps" of a domestic sort to provide assistance for the mother before and after childbirth, but it has been found difficult to obtain candidates for training.

Infant Mortality.—It appears that the association of a high birth-rate with a high infant mortality is a rule to which exceptions are rare. Thus it is the high birth-rate, despite its accompanying waste, rather than the low birth-rate and the greater saving of life that accompanies it, that dominates the increase of population. There is no doubt that the efforts made to preserve infant life have been a very effectual method of preserving the population, but this has not made up for the reduced number of babies born. The chief cause of the deaths of infants are (1) developmental, wasting diseases and convulsions; (2) diarrhoea and enteritis; (3) measles and whooping-cough, bronchitis and pneumonia. One-third of the deaths during the first year occur during the first months of life. What is called the "*infant mortality-rate*" is the number of infants dying under one year of age per 1,000 infants born. The following table shows the infant mortality-rate for England and Wales and the birth-rate for the corresponding year.

	Infant Mortality-rate (per 1,000 births).	Birth-rate (per 1,000 of pop.).
1901–5	138	28·2
1906–10	117	26·3
1913	108	28·0
1916	91	20·9
1917	96	17·8
1918	97	17·7
1919	89	18·5
1920	80	25·4

This shows that the birth-rate has tended to fall as well as the infant mortality-rate, but the fall of the latter is remarkable and may be ascribed partly to the improved social conditions during and since the war, and partly to the definite work for child welfare, as well as to the decrease in the number of births. Where there is overcrowding and bad sanitary conditions child welfare work seems to do little to prevent infant mortality. The rate of mortality amongst illegitimate children is approximately twice as great as that amongst legitimate infants. The Ministry of Health has approved a number of Homes for single women before and after confinement as well as hostels where the mothers and children can live when the mother is able to take up daily work. The highest mortality amongst infants in England and Wales is found in the northern county boroughs which include the great industrial centres, and the least in the southern rural areas. It is to be hoped that with good midwifery and ante-natal service and better social conditions, the large infant mortality that now exists may be decreased, for it is clear that the health of the mother and child is the first step towards the health of the community. The Midwives Act of 1902 and the provisions for maternity benefit in the Insurance

[1] During 1920 fifty new maternity homes with over 500 beds were provided by local authorities and voluntary agencies in England and Wales.

[2] On June 1 1921 there were 1,789 infant welfare centres in England alone, 710 of which were voluntary.

Act of 1911 have no doubt been contributory measures to the improvement in this matter, as well as the School Medical Service that was organized in 1907, and the Maternity and Child Welfare Act of 1918. The death-rate of women in childbirth, however, has remained about the same during the last 25 years, and there is a large amount of abortion, miscarriage, etc., and many children are disabled when born and become chronic invalids. The maternity mortality-rate from all causes remains between 4 and 5 per 1,000 births. The steps necessary to be taken are to secure (1) the supervision of pregnancy and the wise administration of maternity benefit; (2) the supervision of midwifery, including the establishment of maternity homes; (3) health visiting and nursing and (4) the establishment of infant welfare centres. In this work voluntary assistance is most desirable.

A very important fact is that by the Ministry of Health Act of 1919 the physical care of maternity, infancy and childhood is now under one state department and the work of the Education Authority is coordinated so far as possible with that of the Sanitary Authority which primarily deals with the child to its fifth year. The same centres and clinics are now used for both. There is a special department of the Ministry for supervising this work. A scheme of maternity and child welfare has been inaugurated in every county (excepting one county in Wales), and in every county borough and many of the large urban districts. On March 31 1920 not only were there 1,754 maternity and infancy welfare centres and 3,359 visitors as stated before, but also 221 day nurseries or crèches, and 89 maternity homes with 1,360 beds.

The hospital provision for infants is not (1921) large, and there is often a high mortality found in hospitals owing to the spread of infectious conditions which are rather obscure. About 220 new beds have been provided for infants and young children in connexion with welfare schemes. In cases where young children must be separated from their mothers a good foster-mother sufficiently remunerated is recommended as being the most satisfactory guardian.

Scotland.—The Maternity and Child Welfare Act of 1918 does not apply tn Scotland, but in the Notification of Births (Extension) Act of 1915 it is provided that any local authority "may make such arrangements as they think fit, and as may be sanctioned by the Local Government Board for Scotland, for attending to the health of expectant mothers and nursing mothers and of children under five years of age within the meaning of Sect. 7 of the Education (Scotland) Act 1908."

As in England, Exchequer grants-in-aid are given for certain services in connexion with child welfare, and the extent to which these services extend depends on the local authority concerned. There is, however, an important difference between England and Scotland. In England certain institutions such as schools for mothers and play centres receive grants direct from the Board of Education and are under its control. In Scotland all the institutions included in a child welfare scheme were controlled by the Local Government Board and are now controlled by the Ministry of Health. In Scotland, also, the grants are only made to the local authorities and not, as in England, to the institution. These grants cannot exceed 50% of the local authority's approved outlay. The schemes that are carried on are similar in character to those in England. The infant mortality (deaths of children under one year old per 1,000 births registered) is considerably higher than in England and Wales and Ireland though it is gradually decreasing. In 1917 it was 107; in 1918, 100; in 1919, 102; and in 1920 it was 92.

Since the coming into operation of the Scottish Education Act of 1918 there has been a considerable accession of energy in the matter of attending to the health of school-children, and that Act gives powers to the Education Authority to carry on nursery schools. Education Authorities often take advantage of the services of district nurses in following up their cases in the rural areas, and this is sometimes also done by the county council in regard to its schemes for infant welfare. In such cases the nurses may work through a County Nursing Federation. The Highland districts naturally present special difficulties owing to the scattered nature of the population and the difficulty of providing adequate attendance.

Ireland.—A system of Imperial grant for child welfare obtains in Ireland similar to that in England. The infant mortality in Ireland has always been low as compared with that in England and Wales and still more with that of Scotland, but it has not declined in the same regular manner that it has done in the other countries. The deaths of infants under one year per 1,000 births in the years 1891–1900 averaged 104. In 1918 they were 86, and in 1919, 88. It is notable that the infant mortality in the towns in Ireland is immensely higher than in the rural districts. In 1919 the infant mortality in Dublin area was 141 per 1,000 births, while in London it was 85. Notification of births was made compulsory in all urban districts by the Extension Act of 1915.

There are many voluntary societies, such as the Women's National Health Association and the United Irishwomen, working in connexion with infant welfare, and in establishing milk depots, etc., and since the Treasury grant became available a number of authorities have submitted schemes of a comprehensvie character.

United States

In the field of child welfare considerable progress was made in the United States during the decade 1910–20. The first work of the Federal Children's Bureau (established 1912) was a number of remarkable studies on infant mortality, particularly its social and economic aspects. As a result of emphasis by the American Medical Association, by the Children's Bureau and by other children's agencies of the necessity of basing any programme for reducing the infant mortality upon reliable statistics, all but three of the states had adopted in 1921 the uniform registration plan recommended by the Census Bureau, and all but five states now have good registration laws.

Popular education in child care has been greatly developed in the last decade. Aided by the Children's Bureau, Baby Week Campaigns were inaugurated in a few large cities in 1914. In 1916 the General Federation of Women's Clubs and the Children's Bureau coöperated in a nation-wide "Baby Week" campaign, as a result of which Baby Week was observed in every state. In 1918 the Bureau and the Child Conservation Section of the Women's Committee of the Council of National Defense coöperated in a year's educational propaganda known as "Children's Year." As a result of the interest awakened through these campaigns as well as by the previous efforts of many child welfare organizations, child hygiene divisions were established by law in 30 states from 1918 to 1921, as compared with eight states between 1912 and 1918. There were also in 1921, special child hygiene divisions in the health departments of 45 municipalities. The Children's Bureau report on maternal mortality in 1917, followed in 1919 by one on maternity benefit systems in certain foreign countries, resulted in a general demand by women's organizations for public provision for the protection of maternity.

Prior to 1910 pre-natal care for mothers was confined to maternity hospitals. During the decade 1910–20 there were demonstrations in Boston, New York, and a number of other cities of the reductions that can be effected in maternal mortality and in infant mortality due to maternal causes, through maternity centres, where pre-natal and post-natal instruction and care have been given. As a result of the wide-spread interest in the subject, bills have been introduced in a number of the state legislatures; and the Sheppard-Towner bill, providing for Federal aid toward public provision for maternity and child care, was passed by the U.S. Senate in 1921. Medical inspection of school-children was in 1921 required by law in 39 states, and the first legislation had been passed making specific provision for dental inspection. Without this specific legislation increased attention has been given to the care of school-children's teeth in recent years. Nutrition clinics for undernourished children have been widely established during the past five years in connexion with schools, dispensaries, and child welfare agencies. Since 1915 eight states, including Illinois and New York, have passed laws providing for physical education in elementary schools.

CHILE (*see* 6.142).—The term of office of President Don Pedro Montt, inaugurated in Sept. 1906 to serve for a term of five years, was terminated by his death abroad on Aug. 16 1910. Sr. Don Elias Fernandez Albano, the Minister of the Interior, succeeded under the title of vice-president,

as provided in the constitution, article 65. Before a new election for the president could be held, in accordance with the requirements of the constitution, Sr. Albano died on Sept. 6 and was succeeded by Sr. Don Emiliano Figueroa, Minister of Justice, who held office until Dec. 23, the date of the inauguration of Dr. Ramón Barros Luco, the new president elected Nov. 15. Dr. Luco had had a long career of public service starting as a Liberal deputy, and serving as Minister of Finance under President Federico Errazuriz and President Domingo Santa Maria, as Minister of the Interior and premier under Presidents Balmaceda and Jorje Montt, and later premier for several terms. His election, therefore, marked the triumph of the Liberal over the Conservative and Clerical party. In 1910 several other events of general significance occurred. One was the opening of railroad traffic through the Transandine tunnel, connecting Buenos Aires with Santiago and Valparaiso. The piercing of the tunnel occurred late in 1909 and the first trains were run through in 1910, thus completing a remarkable feat of railway engineering and realizing a dream of many decades. Another important event was the celebration of the centennial of Chilean independence, lasting throughout the month of Sept. but concentrating chiefly on the 18th, the centenary of the transference of governmental power from the Spanish governor to the locally elected *junta*. Aside from its effects in stimulating patriotism and national pride, the celebration was made the occasion for according special honours and attention to the Argentine nation and its representatives; this strengthened still further the *rapprochement* between the two nations which dated from the settlement of their long-standing boundary dispute in 1902. In 1911 the Chilean Government paid 2,275,375 bolivianos in settlement of the long-standing Alsop claim, in accordance with the award of King George V. of England. This marked the termination of a dispute which had for years been one cause of bad feeling between the Governments of Chile and of the United States. In 1913 there was completed and put into operation the railway between Arica, a seaport in the provinces secured by Chile from Peru in consequence of the war of the Pacific, and La Paz, the principal city of Bolivia. This line, which has a total length of 264 m., was built by the Government of Chile with the coöperation of Bolivia; until 1928 the control of the entire line was to remain with Chile, after which date Bolivia was to have control of the portion within her territories, under conditions stipulated in the treaty of 1905. The provisions of this treaty with reference to this railway and free access to the sea for Bolivia were among the factors that led to further attempts to settle the long-standing controversy between Chile and Peru with regard to the provinces of Tacna and Arica, especially in the years 1905 and 1908 (*see* TACNA-ARICA). In 1913, the two countries, unable to come to any agreement, decided to postpone the settlement of this question for another 20 years. It was, however, reopened, as will appear later.

At the outbreak of the World War a considerable section of opinion in Chile was inclined to be favourable to Germany. A number of factors contributed toward making this situation a natural one. The Chilean army had long been trained by Prussian officers and modeled on Prussian lines. German scholars held important positions in the institutions of higher learning in Chile, and many native teachers had completed their education in German universities. A considerable homogeneous and thrifty German population, moreover, was concentrated in the southern portion of the country and a well directed propaganda system kept the German point of view before the nation. The clergy, also, were in large part favourable to the cause of Germany against a nation like France which had in recent years adopted such a radical anti-clerical policy. Finally, there was the commercial factor, for in 1914 Germany headed the list of nations in the value of goods shipped to Chile and ranked third in the value of the Chilean goods imported. With this commerce, totalling in that year, in spite of the outbreak of the war, some $44,000,000, or considerably more than a fifth of the total foreign commerce of Chile, was combined a quasi-political propaganda which had not been matched in any way by the other European nations.

The sinking of the German cruiser "Dresden" by British warships in the territorial waters of Chile, which had to be admitted by the British Foreign Office to be irregular, caused a protest, but the incident was adroitly handled in London by the Chilean minister, Augustin Edwards, who, throughout the war, was a friend of the Allies. The reduction of the foreign commerce of Chile by the blockade caused serious economic disturbances almost at the very outset of the war, and especially in 1915. A gradual change in the popular attitude in Chile began to make itself felt, however, in the last two years of the war, although Chile, having virtually no ships engaged in European trade, did not come into immediate conflict with the German submarine policy as did some of the other Latin-American states. Officially Chile maintained a position of strict neutrality, though protesting emphatically against the announcement of German unrestricted submarine warfare, on Feb. 8 1917. Upon the declaration of war by the United States in April 1917, Chile again made a declaration of neutrality.

Meanwhile, in 1915 Sr. Juan Luis Sanfuentes, the candidate of the Liberal Democrats or new Balmacedists, succeeded to the office of president for a five-year term beginning Dec. 23. The political campaign was marked by great excitement and some disorder, including the assassination of one of the deputies. The victory in the election was due to a coalition of the Liberal Democrats with the Conservatives and Nationalists, as against a combination of Radicals, Liberals and Democrats.

The law for the conversion of the currency which was to have gone into effect in 1915 was again postponed for a period of two years. The financial and industrial situation of the country was extremely grave in 1915. Some relief was experienced from the sale of the battleships in construction in British yards which were requisitioned for war purposes by the British Government. The year 1916 saw improvement in the commercial situation as shown by an increase of about $25,000,000 in the value of imports and of nearly $68,000,000 in the value of exports, due chiefly to the allied demand for materials used in the manufacture of munitions. This was the highest figure ever reached up to that time in the export trade of Chile, but it was greatly exceeded the next year and even more in 1918, when the total value of the exports was more than double the value reached in any year prior to 1916.

The year 1917 saw still further improvement in financial and business conditions, though the conversion law was again postponed for a two-year period. The year was again marked by the instability of cabinets which has been so characteristic of the governmental history of Chile. An agreement was reached for the resumption of friendly relations with Peru which had been interrupted in 1910, as on other numerous occasions, over controversies growing out of the old-standing Tacna-Arica dispute. The year 1918 was marked by renewed difficulties with Peru in consequence of anti-Peruvian riots at Iquique and Antofagasta, culminating in the mutual withdrawal of consular agents from both countries. Cabinet resignations were again numerous, a coalition cabinet in April being organized under Arturo Alessandri who was elected two years later to the presidency of the republic. In 1919 the Tacna-Arica controversy again threatened to disrupt the peace of South America. The publication of the secret treaty of 1904 between Chile and Bolivia with reference to the disputed provinces and an outlet to the sea for Bolivia, combined with disturbances involving Peruvians in those areas, aroused animosities anew. In the same year Chile concluded a treaty with Great Britain providing for a permanent peace commission to settle such disputes between the two countries as could not be adjusted through diplomatic channels.

Chile suffered severely from after-the-war readjustment, involving there, as in other countries, labour troubles and radical demonstrations. The year 1920 was marked by one of the most interesting and in some respects the most significant of all the presidential elections of Chile. The contest was be-

tween Sr. Arturo Alessandri, the candidate of the so-called Liberal Alliance, comprising the Radical and Democratic parties and a portion of the Liberals, and Sr. Luis Barros-Borgono, the candidate of the so-called National Union, made up partly of Liberals and largely of Conservatives. Sr. Alessandri was distinctly the exponent of the labour and middle classes. Sr. Barros-Borgono belonged, as had virtually all former presidents of Chile, to the dominant political aristocracy, comprising the long-established families closely affiliated with the landowners and the clergy. The election was held June 25 and the announced electoral vote was 179 for Sr. Alessandri, and 175 for Sr. Barros-Borgono. Under the constitution of Chile, as in the case of the United States, the electoral vote for president is to be canvassed by both Houses of Congress sitting jointly, and in case no candidate receives an absolute majority the power of election rests with Congress. Now with the electoral vote so close and the validity of various electoral votes questioned, a situation arose almost identical with that which occurred in the United States in the famous Hayes-Tilden contest in 1877. The Senate was openly in favour of the candidacy of Sr. Barros-Borgono, and public opinion, which had been raised to the highest pitch, demanded that the counting of the electoral vote should be delayed until the matter could be passed upon by a special court of honour, a proposal put forth by Sr. Suarez-Mujica, a former minister of Chile to the United States. Here again was a reproduction of the extra-legal election commission in the settlement of the Hayes-Tilden dispute. This court of honour, after a strenuous period of activity, finally decided on Oct. 4 in favour of Sr. Alessandri by a vote of five to two, as having received a majority of one electoral vote, 177 valid votes against 176. Congress accepted this finding two days later and declared Sr. Alessandri elected. For a brief period popular excitement ran at fever heat and a general strike was even instituted. The election was remarkable, alike in the manner of its final settlement and in the character of the man elected to the chief magistracy. It was remarkable also, because of the general participation of the labour and middle-class elements and a relatively greater freedom from the practice of buying votes than had ever been experienced before. It was looked upon, therefore, as a distinct triumph of democratic principles.

One further development at the close of this period is worthy of mention, namely, the relation of Chile to the League of Nations. Chile, not being a belligerent in the World War and having adhered to her policy of neutrality, was of course not represented at the peace table. Nor was she, for the same reason, among the original members of the League. She was, however, among those specifically invited by the Covenant to accede thereto, and in his message of June 1919 President Sanfuentes approved the League. This suggestion prevailed, and Chile joined the membership of the League Nov. 4 1919. She was represented at the first meeting of the assembly of the League of Nations in Geneva Nov. 15 1920 by a delegation headed by Sr. Antonio Huneus, Minister of Foreign Affairs, who was honoured with the chairmanship of the commission on the admission of new states.

Population.—In the period between the census of 1895 and that of 1907 (the last official census), the pop. of Chile had increased from 2,712,145 to 3,240,270 showing an annual increase of 1·52%. The estimated pop. on Jan. 1 1918 was 4,038,050. The greatest absolute increase was shown by the province of Santiago in which is located the capital. An increase of more than 100,000 inhabitants was recorded for that province in the interval between the last two censuses. Other provinces that showed a large actual increase were Antofagasta, Valparaiso, Concepción, and Valdivia, while the province of Maule showed a decrease. The provinces of Atacama and Talca showed an estimated decrease in the 10-year period from 1907 to 1917. The great bulk of the population was still comprised within the 12 provinces in the Vale of Chile from Coquimbo to Concepción inclusive, although Antofagasta, Valdivia, and Llanquihue showed a larger actual increase than did any of these 12 favoured provinces except Valparaiso and Santiago and a much larger proportionate increase than any of them. The territory of Magallanes showed an increase of more than 300% between 1895 and 1907 and a further estimated increase of nearly 100% in the succeeding decade. The percentage of urban pop. rose from 38·6% in 1895 to 43·3% in 1907 and as the estimated population for the 47 largest towns in 1918 showed a greater percentage of increase than for the country as a whole, the process of urbanization apparently continued.

According to the census of 1907 there were 134,524 foreigners in the country, representing 4% of the population. The chief nationalities represented were Peruvians, Bolivians, Spaniards, Italians, Germans, English, French and Argentinians in the order named. In the 10-year period 1907–17 there was a decline in the marriage-rate and in the birth-rate, but an even greater decline in the death-rate, so that the excess of births over deaths continued. The total excess of births over deaths in this period amounted to more than 350,000.

Provinces	Pop. Census 1907	Pop. Est. Jan. 1 1918
Tacna	28,748	39,357
Tarapacá	110,936	134,935
Antofagasta	113,323	220,049
Atacama	63,968	63,950
Coquimbo	175,021	191,117

Ancud	—	—
Punta Arenas	12,199	22,964

Communications.—By the end of the year 1918 there were in all 8,512 km. of railway in Chile of which the Government controlled 4,567 km. and private lines the other 3,945 km. The private lines were almost altogether in the three provinces of Tarapacá, Antofagasta and Atacama, in the two former of which (containing 97% of the total mileage of private railways) there were no Government-owned lines at all. Every one of the provinces had some railway mileage within it, varying from 9 km. in the territory of Magallanes to 1,840 in Antofagasta. One effect of the World War was virtually to suspend construction of all kinds of railways. In the six years 1909–14 the Government lines showed a loss of from 5,000,000 to 10,000,000 pesos (1 peso nominally 1s. 6d.) each year; during 1915–7 they made profits of 4,738,423, 3,687,340, and 1,061,502 pesos respectively; but in 1918 they lost 9,124,365. During the 10 years 1909–18 the private railways showed profits from 9,000,000 to 20,000,000 pesos a year. As no explanation of

these figures is supplied, no comparisons can be based upon them. There were in 1918 nine electric traction companies carrying 180,-388,425 passengers concentrated for the most part in the cities of Valparaiso, Concepción, and Santiago. There were also 35,120 km. of public roads and 70 km. of navigable rivers. The length of the Government telegraph lines amounted in 1918 to 15,687 km., operating through 370 offices and employing a personnel of 1,395. The private telegraph lines had in the same year an extent of 9,078 km. with 214 offices and 917 employees. In the years 1914–8 the Government-owned lines showed an excess of expenditures over income of from 100,000 to 1,750,000 pesos a year, while the private lines showed an excess of income over expenditure of from 1,000,000 to 4,000,000 pesos. No figures are available on which to base a comparison of the services rendered. The number of post-offices in 1918 totalled nearly 1,000, with 2,222 men and women employed. The postal revenues in that year amounted to 5,639,897 pesos and the expenditure for the same year to 5,253,283 pesos. The merchant marine in 1918 included 35 sailing vessels of 23,381 tons and 95 steamships of 46,587 tons total. The total number of vessels entered at and cleared from Chilean ports in 1918 amounted to 26,799 aggregating something over 25,000,000 tons. These figures were far below those which had been attained previous to the outbreak of the World War (1914). The four ports in which the entries and clearances exceeded 2,000, in the year 1917, were Punta Arenas, Valparaiso, Iquique, and Antofagasta, in the order named. Over half of these ships were Chilean, Great Britain ranking next, and Germany, of course, wholly eliminated from her former strong position by the war.

Commerce.—The effect of the war on the foreign commerce of Chile was of such a nature that statistics for the years 1914–8 must be regarded as largely abnormal. After a period of rapidly rising figures up to and including the year 1913, there came in 1914 a drop of about 20% in the total figures, followed in 1915 by a further decline which brought the totals below the figures attained in 1908. Then followed a marked increase in 1916 reaching a figure higher than the last pre-war year, and a tremendous increase in the two years following. In 1918 the total foreign trade of Chile amounted in value to 1,235,669,482 pesos gold, considerably more than double the value 10 years before. Of this sum imports represented 436,074,-065 pesos, and exports 799,625,417 pesos, showing a favourable balance of 363,551,352 pesos. The principal countries of origin of the imports in 1918 were the United States, Great Britain, Peru, Argentina, India, France, Spain, Japan and Mexico. The value of the imports from the United States equalled the combined values of the imports from all the other countries mentioned, and was 2¼ times the value of the imports from Great Britain, which in 1914 had been in the lead. The chief countries of destination of exports in 1918 were the United States, Great Britain, Argentina, Peru, Japan, Bolivia, France and Panama, in the order named. The United States alone received goods of a value equal to three-fifths of the total exports from Chile, and exceeded the value exported to Great Britain almost three to one, though in 1914 the exports to Great Britain exceeded in value those to the United States. The chief groups of imports arranged according to value were textiles, gold coin and bullion, chemical products, metals, machinery and implements, and food products. The chief exports arranged in the same manner were minerals, chiefly nitrate; the products of grazing, mostly wool and hides; the products of agriculture, mostly grains and *légumes;* and manufactured food products, principally flour and meal and preserved meats.

Agriculture.—The principal agricultural products showing the number of hectares in cultivation in each and the yield in cwt. appear from the following table for 1918.

Crop	Hectares Planted	Yield in cwt.
Wheat	484,951	5,647,584
Amber Wheat	42,088	644,719
Barley	39,680	719,312
Oats	32,150	461,088
Corn	26,468	367,236
Beans	52,950	693,144
Peas	16,308	145,828
Potatoes	32,806	2,623,587
Alfalfa	45,800	2,522,323
Clover	11,245	433,584

There were in 1918 a total of 66,727 hectares planted in vineyards yielding 1,555,543 hectolitres of wine. In 1917 the figures for the live-stock industry were as follows: 403,013 horses; 36,069 asses; 52,185 mules; 2,029,942 cattle; 4,182,910 sheep; 375,828 goats; 300,832 swine; and 33,506 llama and alpacas.

Manufactures.—In 1917 there were 2,738 manufacturing establishments in Chile employing 64,660 persons and representing an invested capital of 596,265,540 pesos. The value of the output was 701,362,029 pesos. Rated according to the value of their output the chief manufacturing industries were those producing food supplies (which amounted to more than a third of the total), leathers, furs, gas and electricity, clothing, chemical products, paper and printing, metals, alcohol and beverages, lumber, tobacco manufactures, and textiles.

Mining.—In 1917 there were in Chile 38,021 mining properties, the value of whose licenses was 1,040,551 pesos. The value of the production of the principal minerals in 1917 is shown by the following table:—

Nitrate	510,367,506	pesos
Copper	143,512,182	"
Coal	87,740,898	"
Iodine	12,199,105	"
Iron	150,000	"
Borax	2,392,600	"
Sulphur	2,841,300	"
Salt	1,319,290	"
Silver	3,602,485	"
Gold	2,098,440	"

Government and Education.—In 1918 the police force of the republic, exclusive of the municipal police and a force of 2,151 *carabineros*, numbered 8,194. The army the same year comprised 996 commissioned officers of the line, and 82 officers of the intendancy or other service. The total number of troops including non-commissioned officers was 18,826. The navy in 1918 comprised 295 officers and a total force of 5,595 men. The ships were 52 in all, of which one was classed as a battleship, four as cruisers, two as armoured cruisers, two training ships, three transports, one gunboat, nine destroyers, six submarines, five torpedo boats, and the rest of a miscellaneous character, the total tonnage being 129,080. The value of the public works constructed in 1918 was 24,452,276 pesos, of which the largest expenditures were for the ports of Valparaiso and Santiago, roads and bridges, and public buildings. In 1918 there were 3,581 primary schools in Chile, of which 3,058 were Government schools, and 305 private schools receiving subventions; there were 287 secondary schools, of which 150 were Government schools and 86 private schools receiving subventions; and 19 institutions of higher learning, of which 12 were Government institutions, and one received subventions. The total number of pupils in the primary schools in 1918 was estimated at 397,721, almost equally divided between boys and girls, of which number 336,-292 were in public schools. The number of pupils in secondary schools was estimated at 54,722, of whom 31,676 were in public schools. The students enrolled in 1918 in the institutions of higher learning numbered 4,875, of whom 4,228 were in Government institutions. There was a total of 105 daily papers, 81 semi-weeklies, 270 weeklies, 49 semi-monthlies, 126 monthlies, seven quarterlies and a number of miscellaneous publications, making a grand total of 698 periodicals of various kinds. The number of hospitals in the republic in 1917 was 109 with a personnel of 3,973, equipped with 2,217 rooms and 10,655 beds. The total number of patients admitted in 1916 was 108,945. There were in 1916 11,000 inmates of the various charitable institutions.

Finance.—On Dec. 31 1918 there were in circulation 227,688,421 pesos in paper currency. The total amount of gold in the conversion fund at the end of 1918 was 111,272,238. The Government expenses for 1918 amounted to 221,616,130 gold pesos and the receipts to 249,910,012 gold pesos. The national debt stood in 1917 at 625,712,416 gold pesos.

Bibliography.—Among the large number of works that appeared between 1910 and 1920 dealing wholly or partly with Chile, the following are worthy of special mention. (*a*) History:—Crescente Errázuriz, *Historia de Chile sin Gobernador* (1912), *Don Garcia de Mendoza* (1914), and *Francisco de Villagra* (1915); Guillermo Arroyo Alvarado, *Historia de Chile* (1916); Alejandro Alvarez, *Rasgos generales de la historia diplomatica de Chile, 1810–1910;* (*b*) Travel and Description.—J. P. Canto, *Chile: an Account of its Wealth and Progress* (1912); W. H. Koebel, *Modern Chile* (1913); J. G. Mills, *Chile: Physical Features, Natural Resources*, etc. (H. G. J.)

CHINA (*see* 6.166*).—In the absence of any systematic census by the Chinese authorities the figures periodically published for the population of China must always be regarded as rough estimates. The Imperial Maritime Customs' Report for 1916 calculated the total pop. of the country, including the three Manchurian provinces (10,000,000), to be 445,873,000, but the arguments advanced by Mr. Rockhill in 1904 still justify doubts as to the evidence on which these estimates are based. Chinese records since the beginning of the 17th century show that at various periods the estimated pop. of the empire varied between 250 and 430 millions, and that its density always increased rapidly in times of peace and plenty only to be reduced with equal rapidity by outbreaks of floods, famine or civil war. Thus, in 1851 the pop. was believed to be about 430,000,000, but nine years later—after 12 provinces had been devastated by the Taiping rebellion—it was reckoned at 260,000,000. It is probable that in the period immediately preceding the revolution of 1911, the number of inhabitants in most provinces had attained to something approaching its normal maximum, but 10 years'

* *These figures indicate the volume and page number of the previous article.*

tween Sr. Arturo Alessandri, the candidate of the so-called Liberal Alliance, comprising the Radical and Democratic parties and a portion of the Liberals, and Sr. Luis Barros-Borgono, the candidate of the so-called National Union, made up partly of Liberals and largely of Conservatives. Sr. Alessandri was distinctly the exponent of the labour and middle classes. Sr. Barros-Borgono belonged, as had virtually all former presidents of Chile, to the dominant political aristocracy, comprising the long-established families closely affiliated with the landowners and the clergy. The election was held June 25 and the announced electoral vote was 179 for Sr. Alessandri, and 175 for Sr. Barros-Borgono. Under the constitution of Chile, as in the case of the United States, the electoral vote for president is to be canvassed by both Houses of Congress sitting jointly, and in case no candidate receives an absolute majority the power of election rests with Congress. Now with the electoral vote so close and the validity of various electoral votes questioned, a situation arose almost identical with that which occurred in the United States in the famous Hayes-Tilden contest in 1877. The Senate was openly in favour of the candidacy of Sr. Barros-Borgono, and public opinion, which had been raised to the highest pitch, demanded that the counting of the electoral vote should be delayed until the matter could be passed upon by a special court of honour, a proposal put forth by Sr. Suarez-Mujica, a former minister of Chile to the United States. Here again was a reproduction of the extra-legal election commission in the settlement of the Hayes-Tilden dispute. This court of honour, after a strenuous period of activity, finally decided on Oct. 4 in favour of Sr. Alessandri by a vote of five to two, as having received a majority of one electoral vote, 177 valid votes against 176. Congress accepted this finding two days later and declared Sr. Alessandri elected. For a brief period popular excitement ran at fever heat and a general strike was even instituted. The election was remarkable, alike in the manner of its final settlement and in the character of the man elected to the chief magistracy. It was remarkable also, because of the general participation of the labour and middle-class elements and a relatively greater freedom from the practice of buying votes than had ever been experienced before. It was looked upon, therefore, as a distinct triumph of democratic principles.

One further development at the close of this period is worthy of mention, namely, the relation of Chile to the League of Nations. Chile, not being a belligerent in the World War and having adhered to her policy of neutrality, was of course not represented at the peace table. Nor was she, for the same reason, among the original members of the League. She was, however, among those specifically invited by the Covenant to accede thereto, and in his message of June 1919 President Sanfuentes approved the League. This suggestion prevailed, and Chile joined the membership of the League Nov. 4 1919. She was represented at the first meeting of the assembly of the League of Nations in Geneva Nov. 15 1920 by a delegation headed by Sr. Antonio Huneus, Minister of Foreign Affairs, who was honoured with the chairmanship of the commission on the admission of new states.

Population.—In the period between the census of 1895 and that of 1907 (the last official census), the pop. of Chile had increased from 2,712,145 to 3,249,279 showing an annual increase of 1·52%. The estimated pop. on Jan. 1 1918 was 4,038,050. The greatest absolute increase was shown by the province of Santiago in which is located the capital. An increase of more than 100,000 inhabitants was recorded for that province in the interval between the last two censuses. Other provinces that showed a large actual increase were Antofagasta, Valparaiso, Concepción, and Valdivia, while the province of Maule showed a decrease. The provinces of Atacama and Talca showed an estimated decrease in the 10-year period from 1907 to 1917. The great bulk of the population was still comprised within the 12 provinces in the Vale of Chile from Coquimbo to Concepción inclusive, although Antofagasta, Valdivia, and Llanquihue showed a larger actual increase than did any of these 12 favoured provinces except Valparaiso and Santiago and a much larger proportionate increase than any of them. The territory of Magallanes showed an increase of more than 300% between 1895 and 1907 and a further estimated increase of nearly 100% in the succeeding decade. The percentage of urban pop. rose from 38·6% in 1895 to 43·3% in 1907 and as the estimated population for the 47 largest towns in 1918 showed a greater percentage of increase than for the country as a whole, the process of urbanization apparently continued.

According to the census of 1907 there were 134,524 foreigners in the country, representing 4% of the population. The chief nationalities represented were Peruvians, Bolivians, Spaniards, Italians, Germans, English, French and Argentinians in the order named. In the 10-year period 1907–17 there was a decline in the marriage-rate and in the birth-rate, but an even greater decline in the death-rate, so that the excess of births over deaths continued. The total excess of births over deaths in this period amounted to more than 350,000.

Communications.—By the end of the year 1918 there were in all 8,512 km. of railway in Chile of which the Government controlled 4,567 km. and private lines the other 3,945 km. The private lines were almost altogether in the three provinces of Tarapacá, Antofagasta and Atacama, in the two former of which (containing 97% of the total mileage of private railways) there were no Government-owned lines at all. Every one of the provinces had some railway mileage within it, varying from 9 km. in the territory of Magallanes to 1,840 in Antofagasta. One effect of the World War was virtually to suspend construction of all kinds of railways. In the six years 1909–14 the Government lines showed a loss of from 5,000,000 to 10,000,000 pesos (1 peso nominally 1s. 6d.) each year; during 1915–7 they made profits of 4,738,423, 3,687,340, and 1,061,502 pesos respectively; but in 1918 they lost 9,124,365. During the 10 years 1909–18 the private railways showed profits from 9,000,000 to 20,000,000 pesos a year. As no explanation of

district on the Yünnan border. The situation was such, in fact, that, failing a strong ruler at Peking, an upheaval had become inevitable, and its occurrence simply a matter of time and opportunity. The Manchus, seeking some means to avert the impending crisis, had tried several methods of concession, intended to placate Young China. In Nov. 1910, they had yielded to the demand of the National Assembly and promised the convening of the promised parliament for 1913; six months later, the Regent had agreed to replace the Grand Council by a responsible Cabinet. The Imperial Clan was divided against itself at this critical juncture by a struggle for supreme power between the Regent and the Dowager Empress Lung Yu, widow of H. M. Kuang Hsü; divided also, because several of its leading members, under the influence of Prince Tsai Tao, were in favour of a policy of constitutional reform. But even had it presented a united front, the forces which brought about the abdication of the dynasty were beyond its strength.

When, immediately after the outbreak at Hankow, the mutineers captured the Wuchang mint and the arsenal at Hanyang, it soon became apparent that the Regent possessed no resources either of strength or of statecraft. Seriously alarmed by the rapid spread of the rebellion, he was persuaded to call to his aid the famous Chinese viceroy, Yuan Shih-k'ai, whom he had disgraced and dismissed from office in Jan. 1909. By an edict of Oct. 14 1911 Yuan was recalled from his retirement and appointed viceroy of Hunan and Hupeh, with supreme command of the Imperial forces. From this date until his death (June 1916) the direction of affairs at Peking lay in his hands.

Yuan Shih-k'ai's military operations on behalf of the monarchy were half-hearted at best and require but little comment. He took the field towards the end of Oct. but returned to Peking on Nov. 13, having been elected prime minister on the 8th At the end of Nov., after desultory fighting, the position of the rebels in and around Hankow had become untenable. But by this time the propaganda work done by Sun Yat-sen's emissaries, combined with the helplessness of the Manchus, had borne fruit.

Fourteen provinces—or rather their officials—had declared for the revolutionaries and against the monarchy, whilst the attitude of influential mandarins like Tang Shao-yi and Wu Tingfang, who had risen to eminence under the Empress Dowager, was indicative of the fact that the movement was not likely to be suppressed by military force. Nanking held out for the Imperialist cause until the beginning of Dec., at which date Yuan Shih-k'ai agreed to an armistice, for the purpose of discussing the whole situation with the revolutionary leaders. From the outset, after his recall to power, Yuan had done his utmost to stem the tide of disaffection and to preserve the monarchy, shorn of its privileges, as the centre of a reformed constitutional system. He had consistently resisted the demands of the radical extremists, and when, as the result of the increasing demoralization of the court and the sympathetic attitude of the foreign press towards the revolution, Sun Yat-sen's party began seriously to proclaim their intention to establish a republic, he did everything in his power to prevent it. He publicly declared his belief that the overthrow of the throne must mean chaos " amidst which all interests would suffer, and there would be no peace in the empire for several decades." When finally he consented to parley with the revolutionary leaders, he was fighting practically single-handed for the principles in which he believed. The National Assembly, which had adhered to the constitutional programme, had been denounced and superseded by the Kuo Min-tang's Republican Committee at Shanghai, early in November. The British Government and others, which had warmly advocated his recall to office at the beginning of the rebellion, had failed at the critical moment to give him the moral and financial support which he had every reason to expect, and it was evident that without a large foreign loan, his position was hopeless; the Regent had abdicated (Dec. 6) and Tang Shao-yi, the ablest of his lieutenants, had frankly declared his sympathies with the Cantonese republican party.

The armistice negotiations commenced at Hankow on Dec. 11, with Tang Shao-yi acting as Imperial delegate. On the 18th they were transferred to Shanghai upon the demand of the Republican Committee. The result was a foregone conclusion; before the end of the month, the Manchu court had agreed to submit to a National Convention the question of monarchy or republic. On Dec. 25, Dr. Sun Yat-sen, who had been in England when the revolution began, arrived at Shanghai; a week later, a council of provincial delegates at Nanking elected him to be first President of the Chinese Republic, and on Jan. 1 1912 he took the oath of office. On the 12th, the court being terrified by bomb outrages at the capital, the Emperor's abdication was proclaimed in an edict which transferred the government to the people's representatives and declared that the constitution should henceforth be republican. By the same edict, Yuan Shih-k'ai was given full powers to organize a provisional republican government. On Feb. 14, Dr. Sun Yat-sen resigned the presidency in favour of Yuan Shih-k'ai, who was elected provisional President by the Nanking Council and took the oath of office at Peking on March 10. Li Yuan-hung was elected vice-president and a provisional constitution was adopted by the Nanking delegates. On April 2, the Government of the republic was transferred from Nanking to Peking. A new provisional council was formed consisting of five members from each province, elected by the provincial assemblies, five members each from Inner and Outer Mongolia and Tibet, and one member from Kokonor.

Yuan Shih-k'ai's position as President of the republic was one of great difficulty and danger. He had never been at pains to conceal his dislike for the political ideas of the Cantonese party, or his conviction that the monarchical form of government was best suited to the needs of the Chinese people; in the eyes of the Kuo Min-tang Radicals, he was therefore suspect from the outset. If they professed to believe in his conversion to Republicanism, it was because his was the only name likely to inspire the masses with respect for the new régime, and also because they expected him to play the part assigned to him with due respect for the interests of those who had placed him at the head of affairs. In addition to the chaos of the internal situation (already clearly manifested in the struggle for supremacy between rival military chieftains) he was faced with grave financial problems, chiefly due to the fact that the fiscal machinery of the empire had been completely disorganized by the revolution. There were, moreover, increasing difficulties in the field of foreign affairs. Nevertheless, by consummate ability of statecraft, he succeeded during the next four years in bringing something like order out of chaos and gradually restoring the authority of the central Government in the provinces. During his first year in the presidency, the Kuo Min-tang Radicals were still powerful enough to compel him to adopt a policy of watchful waiting and to concentrate his attention upon ways and means for raising money abroad. So long as his treasury remained unreplenished, his position necessarily lacked the prestige which the financial support of the Powers confers, and he had no means of securing the support of the military chieftains, whose troops were usually at the service of the highest bidder. It was not until April 25 1913 that, after prolonged negotiations with the Six-Power group of financiers, Yuan's Minister of Finance succeeded in concluding the " Reorganization " loan, which placed him in possession of the sinews of war to the amount of about 10 millions sterling. His financial position and the moral support of the foreign Powers thus secured, Yuan proceeded to show his hand and to defy the Kuo Min-tang. The latter had secured a powerful majority at the elections held in the beginning of the year. They came to Peking for the opening of Parliament (April 7) in a belligerent mood, greatly exasperated by the assassination at Shanghai of one of their ablest leaders, Sung Chiao-jen, the speaker-elect, whose death was undoubtedly planned and carried out by the President's orders. Assembled under these conditions, the life of the new Parliament was not destined to be a long one; its career, indeed, began and ended with the election of speakers for both Houses. Yuan Shih-k'ai refused to recognize its claim to supervise and sanction his loan negotiations and ordered the conclusion of the agreement with the foreign banks in despite of the agitated protests of the Radical leaders. Realizing the danger of their position many

of these now fled from Peking, and in the central and southern provinces "a war to punish Yuan" was begun. It lasted only two months and ended in a complete rout of the disorganized forces led by Generals Li Lieh-chun and Huang Hsing. Yuan was now firmly in the saddle.

After thus forcibly asserting his authority, Yuan proceeded to vindicate and consolidate it. In the first place, by the lavish use of money and the display of military force, he succeeded in securing his election as President for a term of five years—his title having hitherto been provisional. On Oct. 10 1913 he took the oath of office with much pomp and circumstance, in the throne room of the Winter Palace; and availed himself of the occasion to declare that, for the future, he intended to rule without interference and in accordance with ancient tradition. Four weeks later, a presidential mandate, endorsed by his docile Cabinet, ordered the unseating of all the Kuo Min-tang members of Parliament, on the ground of their treasonable conspiracies. As half of the Senate and more than half of the House of Representatives were thus disposed of, no parliamentary quorum was left. All obstacles to the exercise of Yuan's autocratic authority were thus removed. He continued for a while to profess respect for the principles of constitutional government and loyalty to the republic, but it speedily became apparent that the ideas which inspired his policy were those which he had frankly proclaimed during the crisis of the revolution.

The Parliament at Peking was replaced by a political council and "an administrative conference for the revision of the constitution," composed almost exclusively of officials and *literati* of the old school, selected by the President or by his agents and representatives in the provinces. The provincial assemblies were dissolved, on the carefully directed recommendation of the military governors, "for perversely usurping financial authority and obstructing the business of administration." By the beginning of 1914, it was evident that Yuan intended to restore the old orthodox autocracy and centralization of power in the metropolitan administration; it was also evident that, so far as the great mass of the people was concerned, his policy evoked little or no opposition and that, so far, he was justified in his declared belief that they were "no lovers of changes that ran counter to immemorial custom."

When, upon the advice of his administrative council, the President Dictator announced his intention of performing the Winter Solstice ceremony at the Temple of Heaven and restoring the official worship of Confucius, he proclaimed himself to that nation as an autocratic ruler and gave the first indication of his own imperial ambitions. There is reason for believing that these ambitions had no place in his mind when, in 1911, he strove to uphold the Manchu dynasty, hut that they gradually and insidiously asserted themselves, partly as the result of the exercise of despotic authority and partly by reason of the death of the boy Emperor's guardian, the Empress Dowager Lung Yu (Feb. 1914). Even when his intentions had become unmistakably clear, he fully realized the dangers which confront the creation of a new imperial line under a political system in which the divine right of rulers is intimately bound up with the sacred institution of ancestor worship; but he took his risks and carried his principles to a conclusion for which there were precedents in history and justification in the situation itself. Had the question of his claim to the throne heen decided simply as a matter of internal politics, he would probably have succeeded in establishing and extending his effective authority with the general consent of the nation, weary of civil strife and disorder. But Japan's assertion of her "special rights" and material interests in China, greatly increased after the outbreak of the World War and the expulsion of the Germans from Kiaochow, plainly indicated that Yuan Shih-k'ai would not have a free hand in the matter. His inability to discern the serious danger of intervention from this quarter was the weakest point in his armour; indeed, his failure to grasp the international situation afforded a remarkable contrast to the perspicacity he displayed in dealing with his own countrymen.

Within a year of the outbreak of the World War, the movement for the restoration of the throne in China had assumed definite form and direction. The Chou-An-hui society, composed chiefly of Yuan's supporters, organized an energetic monarchical propaganda at Peking and in the provinces, but they, like the President, failed to draw from the "21 Demands" (which Japan had forced upon the Chinese Government in May 1915) the obvious conclusion that the Japanese Government would strongly oppose Yuan's plans in the event of his advancing serious claims to the throne. During the negotiations which took place between Jan., when the "21 Demands" were first presented, and May, when they were imposed by an ultimatum, the President's attitude towards the Japanese was evasively conciliatory, but it failed to reveal appreciation of the truth that since the days of his residency in Korea he had never been *persona grata* in Japan, and that the Government at Tokyo would therefore do its utmost to prevent his assumption of autocratic power. One of the ablest and most influential scholars in China, the famous political writer, Liang Ch'i-ch'ao, who had strongly supported Yuan's fight for the preservation of the monarchy in 1911, stood forward boldly in Aug. 1915, to denounce the Chou An-hui's propaganda and to warn the President of the perils which threatened the course upon which he was embarking. Resigning his position on the State Council, Liang proceeded to publish his opinions in the *Peking Gazette*, opposing Yuan's accession to the throne, partly on grounds of classical orthodoxy and partly because he perceived the inevitability of Japanese intervention. Yuan, well aware of the far-reaching influence of Liang's views, did all in his power to win his support. Failing in this, he made a pretence of constitutional procedure by referring the question of the monarchy to a vote of the provinces, or rather, to the vote of a number of individuals appointed by himself to represent them. The result, a foregone conclusion, was a practically unanimous vote (Nov. 5) in favour of Yuan's accession.

But Liang Ch'i-ch'ao's wisdom was rapidly justified. On Oct. 30, the Japanese minister, supported by his British and Russian colleagues, conveyed to the President, through his Foreign Office, friendly "advice" to the effect that the Japanese Government deprecated the idea of his restoring the monarchy in his own person, on the ground that the change would lead to serious internal dissensions. Yuan's reply was dignified but short-sighted; he informed the Japanese minister that his Government was quite capable of preventing disorder in China, and that he looked to the Governments of friendly Powers to control the activities of Chinese revolutionaries within their territories. On Nov. 9 the Chinese Government, in announcing the result of the provincial "vote," intimated that no change would take place before the New Year; but this decision was rescinded, and matters hastened by an abortive insurrectionary movement which occurred at Shanghai on Dec. 6. The State Council thereupon memorialized the President to put an end to the prevalent uncertainty and unrest by proclaiming himself Emperor without further delay. On the 12th the monarchy was proclaimed, and the announcement was made that the inauguration ceremony would take place on Feb. 9.

It was not to be. Within a week of the proclamation of the monarchy, a rebellion broke out in the far-western province of Yünnan, led by Tsai Ao, a military official educated in Japan. On Dec. 27 the province, through its officials and local gentry, declared its independence in opposition to the monarchy. Thereafter, in spite of initial successes gained by the Government's forces, the insurrection spread with a rapidity which justified the foresight of Liang Ch'i-ch'ao and emphasized the fact that, as matters stood, Yuan Shih-k'ai had not achieved either the personal prestige or the pecuniary resources sufficient to command for his authority as Emperor the respect and loyalty of the semi-independent chieftains of the provinces. By the end of Jan., Kuangsi and Kueichou had renounced their allegiance and other provinces were wavering. His star was so rapidly declining that his advisers persuaded him to issue an official announcement (Jan. 22) postponing indefinitely the establishment of the monarchy, in view of the country's internal dissensions. Having thus confessed to failure, when within sight of the summit of his ambitions, Yuan's fate as a ruler was sealed. By the end of

March his opponents had become so many and so active that his remaining friends advised him to resign the presidency and retire into private life. A month later he had been denounced as a usurper in nearly every province by the very men who had "elected" him to the throne in Nov., and even at Peking there were but few to do him reverence. Nevertheless he declined to resign the presidency, and attempted a compromise by issuing a mandate (April 22), which transferred all civil authority to a reorganized Cabinet under the premiership of Tuan Chi-jui, an able and ambitious official, who had first achieved distinction, as Yuan's Minister of War, by suppressing Sun Yat-sen's revolution in 1913. In order to placate the Cantonese and other disaffected elements in the South, the President announced his intention of reintroducing parliamentary government without delay. But the Kuo Min-tang Radical leaders were not disposed to come to terms with Peking; the absence of any effective authority at the capital merely served to stimulate new ambitions and create new causes of conflict amongst the political factions. The Kuo Min-tang, repudiating Yuan Shih-k'ai, therefore proclaimed the establishment of a new provisional Government at Canton and elected the Vice-President Li Yuan-hung to the presidency. Peking was now confronted with a renewal of civil war and by a situation which Yuan's persistence in retaining office rendered peculiarly difficult. But at this juncture Yuan died, worn out by an illness which chagrin had aggravated, and Li Yuan-hung duly succeeded to the presidency.

It soon became apparent that with Yuan Shih-k'ai had passed the only hope of restoring a strong central Government in China. Had he lived and succeeded in restoring law and order, he might also have succeeded in turning to his country's permanent advantage the favourable economic situation in which the European War had placed it. But with his death the affairs of the nation became once more involved in a chaotic confusion of personal ambitions and political rivalries, and the functions of Government were rapidly transferred from the civil to the military organization. At the date of Yuan's death, the fiscal relations between Peking and the provinces which he had begun to reorganize in 1914, had completely collapsed, as the result of the new insurrectionary movement; the central Government was confronted by an empty treasury and without means of replenishing it, other than foreign loans. The Government banks at Peking had suspended specie payments in May 1916 and the military governors of the northern provinces, on whose support the administration depended, were loudly clamouring for money wherewith to pacify their unpaid troops. Tuan Chi-jui, as premier of the new Cabinet, endeavoured to disarm the opposition of the Southerners and to secure support for the metropolitan administration, by convening the Parliament which Yuan had broken up in 1913, to meet at the capital on Aug. 1. At the same time he sought to win over the most influential of the Cantonese leaders, Tang Shao-yi (prominent before the revolution as a metropolitan official and *protégé* of Yuan Shih-k'ai), by offering him the Ministry for Foreign Affairs. But Tang Shao-yi and his colleagues of the Canton provisional Government showed no desire for unity; on the contrary, denouncing the Peking administration as "militarists" and monarchists in disguise, they professed to insist upon the immediate restoration of the provisional constitution adopted by the revolutionary leaders at Nanking in 1911. Subsequent events proved clearly that no devotion to any political principle lay behind their factions, and that the central Government could never have disarmed their opposition by granting the Nanking, or any other, constitution. The nation was doomed to civil strife by reason of rivalries that were, and still are, personal and predatory, and which only lawfully constituted authority, backed by disciplined forces, could ever overcome. At the opening of Parliament on Aug. 1, two facts were speedily made manifest: firstly, that the Kuo Min-tang's repudiation of Peking's authority had not been inspired solely by Yuan Shih-k'ai's attempt to restore the monarchy and would not end with it; secondly, that the existence and proceedings of Parliament, no matter under what constitution convened, were completely at the mercy of the military governors. One of the first steps taken by Gen. Li Yuan-hung, as President of the republic, was to call a meeting of generals and to inform them that the country's destinies lay in their hands. Thenceforward the northern military governors, led by the premier Tuan Chi-jui, became the dominant factor of the situation. At the outset they were frankly opposed to the revival of the Nanking constitution and to the reassembling of the Parliament of 1913, while the navy, with its headquarters at Shanghai, was equally decided in its refusal to acknowledge the authority of Peking until Parliament had resumed its functions. Finally, a compromise was reached by the formation of a new Cabinet wherein the South was represented. Parliament, in which the Kuo Min-tang party predominated, declared its intention of adhering to the Nanking provisional constitution, pending the completion of a new and permanent instrument, for the preparation of which a special drafting committee was appointed. But it was not long before the military governors made it plain that, while they might permit the parliamentarians to debate their theories of government, its practice would continue to be determined by their own necessities, and that the chief problem with which the Cabinet would henceforth have to grapple, lay in the provision of funds for the maintenance of their uncontrolled and uncontrollable armies. After the passing of Yuan Shih-k'ai the history of the Chinese Government became a series of expedients and experiments intended to provide a temporary solution of this problem, all of which tended to aggravate its difficulty.

At the time of his "election" to the throne, in Nov. 1915, Yuan Shih-k'ai had made certain tentative overtures through the legations at Peking, with a view to China's abandonment of neutrality and her espousal of the cause of the Allies. By the adoption of this course he hoped not only to obtain the financial relief which he required, but to make provision for assistance in the future against the policy of encroachment displayed by Japan in the "21 Demands." But he was compelled to abandon negotiations to this end, because of the troubles that began to press upon him and because of the Japanese Government's unconcealed opposition to the proposal. After his death, however, the chief reason for this opposition was removed and in the winter of 1916, the question of China's joining the Allies came to be seriously considered by Tuan Chi-jui's Cabinet. The premier and most of his colleagues were anxious to take this step, because it offered an opportunity of suspending the Boxer indemnity payments and of securing Chinese representation at the Peace Conference at the close of the war. But amongst the older officials, there were some (including the President) who, greatly influenced by the activities of German agents and their lavish propaganda, preferred a policy of passive neutrality. Opinion was therefore divided and before the question was finally settled (March 11) by a decisive vote of both Houses of Parliament, it had become inextricably involved in the dissensions and intrigues of the rival political factions at the capital, and had led to an open breach between the Premier and the President. On Feb. 4 the U.S. minister at Peking invited the Chinese Government to follow the example of the United States by formally protesting against Germany's submarine campaign and by severing diplomatic relations; on the 9th, the Chinese Foreign Office conveyed an intimation to the German minister in the sense required. The premier's party were now for immediate action, but their policy was opposed and denounced by the German-subsidized section of the press and by the President's party in Parliament, advocating cautious delay. On Feb. 28, the Allied ministers at Peking, by a joint memorandum, notified the Chinese Government that if diplomatic relations with Germany were severed, the Powers would suspend the Boxer indemnity payments and consent to a revision of the Chinese customs tariff. The premier, after consulting his supporters at Peking and in the provinces, decided to act upon this advice and to instruct the provincial authorities accordingly. The President's refusal to confirm these instructions led to a ministerial crisis; eventually, after the premier had tendered his resignation, the President gave way. Tuan Chi-jui's policy having been endorsed by Parliament, relations with Germany were severed on March 14 1917; on the

same day the German ships at Shanghai and Amoy were seized by the Chinese authorities, and on the 25th the German minister and his staff left Peking.

The premier and his supporters were now anxious to carry their policy to its logical conclusion and to secure the benefits of complete identification with the cause of the Allies, by declaring war against the Central Powers. A conference of military governors convened by the premier at Peking on April 26 voted decisively for war; a few days later the Cabinet adopted a unanimous resolution to the same effect. But once again the national aspect of the question became submerged in a welter of factional intrigues. The President's party, consisting of a number of Kuo Min-tang parliamentarians, who professed to see in the attitude of the military governors a menace to parliamentary government, and of others alarmed by the increasing rumours of secret agreements between Tuan Chi-jui's party and the Japanese Government, constituted an opposition sufficient to prevent the Cabinet from carrying its resolution into effect. Among the *literati* and disinterested patriotic men there undoubtedly existed a genuine difference of opinion as to the advisability of committing the nation definitely to a policy of hostility to Germany, a difference which was reflected in the conflicting advice publicly given by scholars like Liang Ch'i-ch'ao and Kang Yu-wei. But so far as Parliament was concerned, the question resolved itself into a sordid struggle for power between Tuan Chi-jui, backed by the northern Tuchuns, and his political opponents. At a secret session of the Lower House of Parliament on May 10, it was apparent that the question of war with Germany had become subordinate to that of a combined attack upon Tuan Chi-jui. On May 19 a resolution was adopted to the effect that the House would decline further to consider the question until the Cabinet had been reconstructed. As Tuan's colleagues with one exception had resigned at the first sign of serious trouble, the resolution amounted to a demand for the premier's resignation. Tuan, however, held his ground stoutly and countered the Kuo Min-tang move by a communication from the military governors to the President demanding the immediate dissolution of Parliament, and by the announcement of their intention not to leave the capital until this had been done. Thus challenged, the President issued a mandate (May 23) dismissing the premier and appointing the septuagenarian Wu Ting-fang in his place. Tuan, following the course usual on such occasions, fled from the capital and, taking refuge with the military party's leaders at Tientsin, announced his intention of defying the President's authority. The military governors of several provinces north of the Yangtsze thereupon proceeded to declare their independence of the central Government whilst the Kuo Min-tang leaders, hurriedly leaving the capital for the South, announced their intention of taking up arms in defence of Parliament and the people's liberties. It is typical of the chaotic condition of Chinese affairs that at this juncture Gen. Feng Kuo-chang, the Vice-President, while tendering his resignation, announced that the lower Yangtsze region would remain "neutral."

The struggle thus begun lasted for three months and postponed China's declaration of war against Germany until the middle of August. As it proceeded, it became more and more apparent that the contending factions were not really concerned with any question of political principles, but fighting only for place and power. At the beginning of June, the military governors established a "Provisional Government" of their own at Tientsin with the aged ex-viceroy, Hsü Shih-chang (later President of the republic), cast for the dummy rôle of president-dictator. At the same time they warned Li Yuan-hung that if he desired to remain President, he must submit to their wishes and dissolve Parliament; to enforce their demands they proceeded to mass troops in the vicinity of the capital. Li Yuan-hung sought to gain time by summoning to his aid as "mediator" Gen. Chang Hsün, the famous swashbuckler chieftain of Shantung fame. Gen. Chang promptly came north with a "bodyguard" of several thousand troops, and arrived at Peking on June 12; but the value of his mediation was discounted in advance by the announcement that he would insist upon the dismissal of Parliament, and by rumours of his intention to restore the Manchu dynasty. On June 13 Li Yuan-hung yielded, and Parliament was dissolved by presidential mandate.

The question of joining with the Allies against Germany was now relegated by common consent to the background and all attention concentrated on the struggle of personal ambitions at Peking. Tuan Chi-jui, with his Tuchun supporters, was still in watchful waiting at Tientsin. Parliament had elected a new Premier (Li Ching-hsi) but the attitude of the military party made it an uncomfortable post to fill and he had cautiously declined to assume office. Many of the Kuo Min-tang politicians had fled to Shanghai and Canton and, with the support of the navy, were once more preparing to take the field against Peking. Under these conditions the danger of internal dissensions on a wide scale without definite purpose was unmistakably more serious than at any time since the overthrow of the Manchus. Regarding the matter in this light, the United States addressed a note to the Chinese Government (June 6) deploring the prospect of civil war and intimating that the restoration of national unity was a matter of more immediate importance to China than the declaration of war against the Central Powers. This advice, though morally sound, was politically unfortunate, inasmuch as it was construed and proclaimed by the Kuo Min-tang as an intimation that the U.S. Government was opposed to the policy of Tuan Chi-jui and his military supporters; it therefore resulted in stiffening Young China and the Cantonese Radicals in their uncompromising hostility to the central Government. It was common knowledge that Tuan Chi-jui had framed and pursued his policy in close touch with Japan, and that he relied upon that country for financial support; it was only natural therefore that Young China should look to the United States not only to deliver them from the militarist and monarchist party, but to protect the Chinese republic from Japan.

General Chang Hsün, as the central figure on the Peking stage, soon showed that he had no intention of attempting to bring about a reconciliation between President and premier. His proceedings were so obviously inspired by his own overweening ambitions that it was not long before signs of dissension manifested themselves between him and his colleagues of the military party. When his policy became fully revealed by a *coup de main* (July 1) which withdrew the young Emperor from his retirement and proclaimed the restoration of the Dragon Throne, the chief cause of the opposition which his action promptly evoked from Tuan Chi-jui and the Peiyang military chiefs lay in the fact that he proposed to appoint himself regent and viceroy of Chihli. Few, if any, of those who now denounced Chang Hsün as a traitor to the republic and took the field against him, were in reality opposed to the monarchy (most of them were, in fact, solemnly pledged to support the restoration); but they could not brook the assumption of supreme authority by one who had stolen a march upon them and taken advantage of their divided counsels. Tuan Chi-jui, in particular, was known to be in favour of the monarchy, but only on condition that he himself became viceroy of Chihli and the power behind the throne. Emerging therefore from his retirement at Tientsin, he led his army to the capital to defend the republic. After a few days of desultory and half-hearted fighting, Chang Hsün capitulated (July 12) and the young Emperor was consigned once more, with all due respect, to the tranquil dignity of his court without a kingdom. Chang Hsün's troops were permitted to retire, with the honours of war and three months' pay; their leader, who had found a temporary refuge in the Dutch legation, was left unmolested.

In "vindicating the Republic," Gen. Tuan had received the active support of the Vice-President, Gen. Feng Kuo-chang, commanding the army at Nanking. After the capitulation of Chang Hsün, Tuan resumed the premiership, with powers that were practically those of a dictator, so that the position of Li Yuan-hung as President became impossible. From the Japanese legation, whither he had fled for safety upon the proclamation of the monarchy, he announced his intention of retiring into private life. On July 18 he was succeeded in the presidency by

Feng Kuo-chang, who declared his readiness to endorse the policy of the premier in the matter of declaring war against the Central Powers. The agreement thus reached gave promise of a united administration and a clear-cut policy at Peking; nevertheless, it failed to reconcile the disaffected elements represented by the Kuo Min-tang. These declared the new Government to be illegally constituted and demanded the immediate convocation of Parliament; failing which (as a proclamation by Sun Yat-sen announced) it would meet, under a provisional Government, at Canton. Undeterred by this opposition, the premier, after receiving certain assurances from the Allied ministers, notified them that China would declare war against Germany so soon as the new President had assumed office. Feng Kuo-chang arrived at Peking on Aug. 1; two days later, the Cabinet adopted a unanimous resolution in favour of the declaration of war, which was formally issued on Aug. 14.

The critical situation in Russia and the impossibility of predicting the future policy of that country, made it difficult for the Allied Governments to come to a common understanding in regard to the financial and other advantages to be conceded to China upon abandoning her neutrality. It was eventually agreed to suspend the Boxer indemnity payments and to authorize an increase in the Maritime Customs tariff; and at the same time the Government's immediate necessities were relieved by a loan of 10 million yen from the Consortium banks.

With its foreign debt obligations thus diminished and its revenue materially increased by Sir Richard Dane's highly successful reorganization of the salt *gabelle*, the Chinese Government had an opportunity of regaining financial and political equilibrium such as had not occurred since the beginning of the century. Had Tuan Chi-jui seized the opportunity by offering to the southern leaders representation in the Cabinet and a fair share of the sweets of office, harmony might possibly have been restored; but he refused to do so and his new Cabinet (July 17) contained only representatives of the military party and the Chin Pu-tang. The result was a rapid development of a new separatist movement in the South, which had begun in June, after the dissolving of Parliament, by the secession of Kwangtung. Henceforward, during the period with which we are dealing, the history of China becomes an increasingly hopeless tangle of faction feuds. Almost before the new President had assumed office at the capital, his adherents (the Chihli group of the Peiyang party) were in conflict with the premier concerning the policy to be adopted in dealing with the South; Tuan Chi-jui being all for strong measures, and Feng Kuo-chang for conciliation. As the result of these differences, Tuan Chi-jui once more resigned; but again his friends, the military governors, intervened and proclaimed their intention of carrying on the war against the South, with or without the consent of the Government. Eventually Gen. Chang Tso-lin, the Tuchun autocrat of Manchuria, put an end to all further peace talk by moving a large body of troops into Chihli; Tuan Chi-jui thereupon resumed the premiership and, with the support of the northern Tuchuns, took up the offensive against the southern provinces.

Having "vindicated the Republic," it was necessary for Tuan Chi-jui to maintain the appearance of constitutionalism. He therefore convened an assembly, which proceeded to revise the law for parliamentary elections. This having been duly promulgated (Feb. 17 1918), a new Parliament (considerably reduced in numbers) was elected, in time to deal with the quinquennial election of the president.

On Sept. 4 the presidential election took place, but the matter had been decided in advance by the military Tuchuns, assembled in conference at Tientsin. Feng Kuo-chang was passed over, because of his inability to work with Tuan Chi-jui, and in his place was elected Hsü Shih-chang (in 1921 President of the republic), a veteran official who had achieved a reputation for sagacity as viceroy of Manchuria and guardian of the heir-apparent under the monarchy.

Meanwhile, headed by the Chinese guilds and chambers of commerce at the treaty ports, a strong movement had begun to manifest itself on the one hand against the continuance of civil war, and on the other against the subservience and venality of the Peiyang politicians in their dealings with Japanese agents. This attitude of the business community was endorsed and the country's urgent need of peace emphasized, by earnest representations addressed to the Chinese Government by the Allied ministers at Peking. The new President was well aware of the dangers of China's internal and international position; by temperament and training inclined to methods of conciliation, he did all in his power to restore peace and goodwill between the Peiyang party and the Cantonese leaders of the South. On Nov. 16 he issued a presidential mandate, calling upon the commanders of the northern forces to suspend hostilities and to keep within their own lines. This armistice was followed by negotiations for a conference (eventually convened at Shanghai) with a view to removing the alleged grievances of the southern Constitutionalists and finding means to amalgamate the rival parliaments under a coalition Government. The President's action was undoubtedly influenced, and the peace movement strengthened, by the Allies' victorious conclusion of the war; for a little while it seemed as if the Shanghai conference might lead to some definite and satisfactory conclusion, but in the end it merely served to demonstrate the fact that neither party had any sincere desire to put an end to the civil strife, from which not only the northern Tuchuns but the southern parliamentarians profited.

As leader of the southern delegates at the Shanghai peace conference, Tang Shao-yi demanded the cancellation of the Government's military agreement with Japan, the abolition of the War Participation Bureau, and a pledge that the Peking authorities would accept no further financial assistance from Japan. Most of the eight demands which he laid before the northern delegates (May 1910) evoked but little public interest, but the increasing evidence of Japanese political and financial ascendancy at Peking produced a strong manifestation of opinion by Young China in support of the southern party's attitude, which was greatly increased by the decision of the Versailles Conference in regard to the Shantung question. The Sino-Japanese military agreement (March 1918) was the most important of several secret pacts concluded by Tuan Chi-jui's Cabinet. It was ostensibly intended to provide for united action by China and Japan against German and Bolshevik activities in Siberia, and especially for the protection of the Siberian railway; but, according to the leaders of the southern party, it not only gave Japan a steadily extending control over China's military forces in the North, but it virtually reëstablished many of the "protectorate" conditions which had been imposed (and subsequently withdrawn as the result of representations by the Powers) under Group V. of the "21 Demands" of May 1915. So strong was the feeling produced by the student strike, the boycott, and other manifestations of Young China's indignation at the increasing evidence of Japanese ascendancy at Peking, that the Chinese Government was compelled to instruct its representatives at Versailles not to sign the Peace Treaty; and two of the members of Tuan Chi-jui's Cabinet, who were most prominently identified with the Government's financial dealings with Japan, were compelled to resign. The attitude of the southern party remained, however, irreconcilable, and the renewed discussions of the Shanghai peace conference were fruitless; indeed, a fresh cause of offence was proclaimed by the southern delegates in the fact that the military agreement, which should have automatically ended at the same time as the Allied intervention in Siberia, remained in force by virtue of a new pact, said to have been secretly concluded at Peking in March 1919.

Since the death of Yuan Shih-k'ai, the position of the group of politicians in control of the Government at Peking had become entirely a question of funds, in the sense that Tuan Chi-jui and his supporters were continually confronted by the alternative of either retiring into private life or of raising money sufficient to retain the support of the northern military governors. It was a position which never offered any prospect of stability or permanency; no Government could hope to maintain itself in power if once its borrowing capacities were exhausted. In the summer of 1920 the inevitable happened. Denounced by Young

same day the German ships at Shanghai and Amoy were seized by the Chinese authorities, and on the 25th the German minister and his staff left Peking.

The premier and his supporters were now anxious to carry their policy to its logical conclusion and to secure the benefits of complete identification with the cause of the Allies, by declaring war against the Central Powers. A conference of military governors convened by the premier at Peking on April 26 voted decisively for war; a few days later the Cabinet adopted a unanimous resolution to the same effect. But once again the national aspect of the question became submerged in a welter of factional intrigues. The President's party, consisting of a number of Kuo Min-tang parliamentarians, who professed to see in the attitude of the military governors a menace to parliamentary government, and of others alarmed by the increasing rumours of secret agreements between Tuan Chi-jui's party and the Japanese Government, constituted an opposition sufficient to prevent the Cabinet from carrying its resolution into effect. Among the *literati* and disinterested patriotic men there undoubtedly existed a genuine difference of opinion as to the advisability of committing the nation definitely to a policy of hostility to Germany, a difference which was reflected in the conflicting advice publicly given by scholars like Liang Ch'i-ch'ao and Kang Yu-wei. But so far as Parliament was concerned, the question resolved itself into a sordid struggle for power between Tuan Chi-jui, backed by the northern Tuchuns, and his political opponents. At a secret session of the Lower House of Parliament on May 10, it was apparent that the question of war with Germany had become subordinate to that of a combined attack upon Tuan Chi-jui. On May 19 a resolution was adopted to the effect that the House would decline further to consider the question until the Cabinet had been reconstructed. As Tuan's colleagues with one exception had resigned at the first sign of serious trouble, the resolution amounted to a demand for the premier's resignation. Tuan, however, held his ground stoutly and countered the Kuo Min-tang move by a communication from the military governors to the President demanding the immediate dissolution of Parliament, and by the announcement of their intention not to leave the capital until this had been done. Thus challenged, the President issued a mandate (May 23) dismissing the premier and appointing the septuagenarian Wu Ting-fang in his place. Tuan, following the course usual on such occasions, fled from the capital and, taking refuge with the military party's leaders at Tientsin, announced his intention of defying the President's authority. The military governors of several provinces north of the Yangtsze thereupon proceeded to declare their independence of the central Government whilst the Kuo Min-tang leaders, hurriedly leaving the capital for the South, announced their intention of taking up arms in defence of Parliament and the people's liberties. It is typical of the chaotic condition of Chinese affairs that at this juncture Gen. Feng Kuo-chang, the Vice-President, while tendering his resignation, announced that the lower Yangtsze region would remain "neutral."

The struggle thus begun lasted for three months and postponed China's declaration of war against Germany until the middle of August. As it proceeded, it became more and more apparent that the contending factions were not really concerned with any question of political principles, but fighting only for place and power. At the beginning of June, the military governors established a "Provisional Government" of their own at Tientsin with the aged ex-viceroy, Hsü Shih-chang (later President of the republic), cast for the dummy rôle of president-dictator. At the same time they warned Li Yuan-hung that if he desired to remain President, he must submit to their wishes and dissolve Parliament; to enforce their demands they proceeded to mass troops in the vicinity of the capital. Li Yuan-hung sought to gain time by summoning to his aid as "mediator" Gen. Chang Hsün, the famous swashbuckler chieftain of Shantung fame. Gen. Chang promptly came north with a "bodyguard" of several thousand troops, and arrived at Peking on June 12; but the value of his mediation was discounted in advance by the announcement that he would insist upon the dismissal of Parliament, and by rumours of his intention to restore the Manchu dynasty. On June 13 Li Yuan-hung yielded, and Parliament was dissolved by presidential mandate.

The question of joining with the Allies against Germany was now relegated by common consent to the background and all attention concentrated on the struggle of personal ambitions at Peking. Tuan Chi-jui, with his Tuchun supporters, was still in watchful waiting at Tientsin. Parliament had elected a new Premier (Li Ching-hsi) but the attitude of the military party made it an uncomfortable post to fill and he had cautiously declined to assume office. Many of the Kuo Min-tang politicians had fled to Shanghai and Canton and, with the support of the navy, were once more preparing to take the field against Peking. Under these conditions the danger of internal dissensions on a wide scale without definite purpose was unmistakably more serious than at any time since the overthrow of the Manchus. Regarding the matter in this light, the United States addressed a note to the Chinese Government (June 6) deploring the prospect of civil war and intimating that the restoration of national unity was a matter of more immediate importance to China than the declaration of war against the Central Powers. This advice, though morally sound, was politically unfortunate, inasmuch as it was construed and proclaimed by the Kuo Mintang as an intimation that the U.S. Government was opposed to the policy of Tuan Chi-jui and his military supporters; it therefore resulted in stiffening Young China and the Cantonese Radicals in their uncompromising hostility to the central Government. It was common knowledge that Tuan Chi-jui had framed and pursued his policy in close touch with Japan, and that he relied upon that country for financial support; it was only natural therefore that Young China should look to the United States not only to deliver them from the militarist and monarchist party, but to protect the Chinese republic from Japan.

General Chang Hsün, as the central figure on the Peking stage, soon showed that he had no intention of attempting to bring about a reconciliation between President and premier. His proceedings were so obviously inspired by his own overweening ambitions that it was not long before signs of dissension manifested themselves between him and his colleagues of the military party. When his policy became fully revealed by a *coup de main* (July 1) which withdrew the young Emperor from his retirement and proclaimed the restoration of the Dragon Throne, the chief cause of the opposition which his action promptly evoked from Tuan Chi-jui and the Peiyang military chiefs lay in the fact that he proposed to appoint himself regent and viceroy of Chihli. Few, if any, of those who now denounced Chang Hsün as a traitor to the republic and took the field against him, were in reality opposed to the monarchy (most of them were, in fact, solemnly pledged to support the restoration); but they could not brook the assumption of supreme authority by one who had stolen a march upon them and taken advantage of their divided counsels. Tuan Chi-jui, in particular, was known to be in favour of the monarchy, but only on condition that he himself became viceroy of Chihli and the power behind the throne. Emerging therefore from his retirement at Tientsin, he led his army to the capital to defend the republic. After a few days of desultory and half-hearted fighting, Chang Hsün capitulated (July 12) and the young Emperor was consigned once more, with all due respect, to the tranquil dignity of his court without a kingdom. Chang Hsün's troops were permitted to retire, with the honours of war and three months' pay; their leader, who had found a temporary refuge in the Dutch legation, was left unmolested.

In "vindicating the Republic," Gen. Tuan had received the active support of the Vice-President, Gen. Feng Kuo-chang, commanding the army at Nanking. After the capitulation of Chang Hsün, Tuan resumed the premiership, with powers that were practically those of a dictator, so that the position of Li Yuan-hung as President became impossible. From the Japanese legation, whither he had fled for safety upon the proclamation of the monarchy, he announced his intention of retiring into private life. On July 18 he was succeeded in the presidency by

and support on the plea, *inter alia*, that they were fighting "to make China safe for democracy." Tested by the terms of the provisional constitution, neither the Peking nor the Canton Parliament was a legal body, and the military Government of the South could have no claim to constituted authority. But whatever the legal aspects of the dispute, the result of this dissension in the ranks of the mandarinate was to produce a chronic condition of civil war, or rather of widespread brigandage and unrest, throughout the country, and to nullify the efforts of the genuine progressives and patriots for securing reform.

Immediately after the revolution of 1911, the executive authority in each province was assumed by the local military commanders (Tutuhs)—in most cases natives of the province. Generally speaking, the administration remained as before, in the hands of the bureaucracy, *minus* such control as the central Government had hitherto exercised. Under the dictatorship of Yuan (1913–6) that control was partially reëstablished, and to a certain extent the provincial and local administrations became once more responsible, if not subject, to the central Government. In May 1913, President Yuan defined and promulgated by mandate the conditions under which the official systems of provinces, districts and circuits were to be administered, reëstablishing the supreme authority of the civil, as opposed to the military, mandarinate. The provincial assemblies were suppressed, and the position of district magistrates strengthened. But after the death of Yuan no further attempts at centralization of the Government were possible, and as the result of widespread disorders the administration passed rapidly from the civil to the military mandarins. The Tuchuns (as the military governors came then to be called) gradually usurped all the important functions of administrative authority; and even in those provinces (*e.g.* Chihli and Kwangtung) where the civil governor has continued to function as the chief executive, his policy and proceedings have conformed generally to those of his military colleague. According to the provisions of the permanent constitution advocated by the southern parliamentarians, the provincial administration is to consist of a civil governor, a military governor, an intendant (the Taotai of the old régime), a district magistrate, and four heads of departments—general affairs, interior, education and commerce; but it is evident that, failing means to control the autocratic power of the military chieftains, no constitution can avail to secure uniformity of administration on these, or any other, lines.

As matters stand, the executive authority of the central Government is provisionally vested in a premier, nominated by the President, and a Cabinet of nine ministers, nominated by the premier. The Chinese names of the ministries have been changed since the abolition of the monarchy, but their general composition and functions remain practically the same. The nine ministries control respectively foreign affairs, home affairs, finance, army, navy, justice, education, commerce and communications. There are five subsidiary departments, dealing respectively with Mongolia and Tibet, railways, telegraphs, audit and customs; to most of the ministries and departments a number of foreign advisers and technical experts have been attached.

The Civil Service.—Much of the political unrest and disorganization which have prevailed of recent years in China is ascribable to the suddenness with which the ancient system of classical examinations for the public service was abolished by the Manchu Government in 1906, and to the subsequent failure of the republican administration to replace it by any practical and authoritative scheme which shall ensure the continuity of the competitive principle. Under the new system of examination introduced in 1906 by order of the Empress Dowager, candidates for the civil service were required to display some knowledge of western science in addition to the Chinese classics. During the first four years of the republic, the system was even more rapidly modernized, the classics and philosophy being abandoned in favour of modern history, geography, law and science. But under the dictatorship of Yuan Shih-k'ai, this process was reversed and knowledge of the classics restored to its pride of place in the official curriculum. The general disorganizatinn of public affairs and internal disorders prevalent since 1916 prevented the adoption of any comprehensive system applicable to, and accepted by, the whole nation; nevertheless, the holding of office remains the chief highroad to wealth and distinction in China, and the number of aspirants to position under the Government is probably greater to-day than at any previous period in the history of the country. In those provinces where the authority of the central Government is recognized, the system now in force requires all candidates to be possessed of a diploma or high-school certificate. There are two classes of examination, one for those who aspire to important posts under the central Government and the other for clerkships and minor posts in the provinces. Under the republic the ancient rule which precluded mandarins from holding high offices in their native province, or for a period exceeding three years, has been abolished.

Justice.—Towards the close of the Manchu reign, with a view to removing the stigma of barbarism attaching to the Chinese administration of justice, and thus to inducing the consent of the Powers to the abolition of the foreigners' extra-territorial rights, the Chinese Government was advised to compile a provisional criminal code, abolishing the torture and flogging of prisoners and certain barbarous methods of inflicting the death penalty. This new code, based on the continental model, was promulgated in 1912, the first year of the republic; it embodied most of the legislation inspired by western ideals of humanitarianism. But like many other changes prescribed at this period from Peking, it remained without appreciable effect upon the administration of justice in the provincial *Yamêns*, partly because the disordered condition of the country precluded any prospect of systematic reform in this direction, and partly because lack of funds prevented the provision of the courts, prisons, reformatories, and asylums which the code prescribed. It remained therefore to all intents and purposes a dead letter. Since then, the preparation of another new criminal code has been undertaken, part of which was published in 1918; and with the assistance of Japanese advisers, civil and communal codes have been drafted, providing for the imaginary needs of many non-existent conditions. The new system, as laid down in these codes, provides for officials with purely judiciary powers, for judges functioning respectively in the High Court of Justice at Peking, in provincial high courts, metropolitan courts and courts of First Instance, but generally speaking these judges and courts, like trial by jury and the scheme of prison reform promulgated by the Minister of Justice in 1912, have remained pious aspirations on paper, and must continue to be unattainable so long as the central Government lacks not only the authority but the men and the funds required to carry them into effect. According to a statement published by the Ministry of Justice in 1913, 689 new courts of justice had then been established and 13 model gaols provided; nevertheless, in most provinces the district officials remain, as before, charged with judicial functions, and the administration of justice, as far as the masses are concerned, is practically the same as that which obtained under the old régime. The widespread brigandage and continual struggles for supremacy between rival Tuchuns, which became chronic conditions in most provinces after 1916, forbade all hope of effecting any general and permanent reform of the judicial system sufficient to justify the Chinese Government's aspirations in the matter of the abolition of extra-territoriality.

Defence.—As the result of the political disorganization prevailing since the death of Yuan Shih-k'ai, the Chinese army, as a national defence organization, practically ceased to exist, but the troops actually serving under one or other of the 22 Tuchuns (military governors) are probably more numerous to-day than at any per od of the Manchus' rule. The number of these irregular and undisciplined forces was estimated by Chu Chi-chien (northern delegate at the Shanghai peace conference in 1919) at 1,290,657 men of whom 540,344 were supposed to be under the orders of the central Government; but, as the result of the political conditions and the strife of factions at the capital, the majority of the forces stationed in the metropolitan province and in Manchuria owed their allegiance to their respective Tuchuns, and even to the President in his individual capacity, rather than to the Ministry of War. In the words of a Chinese writer,[1] "the army has acquired provincial associations and lost its national character"; moreover, "in the absence of discipline among the inadequately paid troops, it is sometimes impossible to distinguish between the soldiers and the brigands whom they are expected to suppress." The inability of the central Government to collect its revenues from the provinces, and therewith to make due provision for the payment and control of a national army, has led to the creation of independent provincial forces, which have not only held the metropolitan administration to ransom, but levied tribute on the country at large. The disbandment of these forces is generally recognized in China to be a measure imperatively necessary, as a preliminary to the restoration of normal conditions.

Finance.—In Nov. 1912, prior to the conclusion of the organization loan of 1913, a board of audit was established at Peking, with foreign expert assistance, to audit the revenues and expenditure of the central and provincial Governments; nevertheless, the only reliable information available up to June 1921 on the subject of national finance were the published returns of the Inspectorate General of Customs and the revenue totals of the salt *gabelle*, collected under foreign supervision. The purely *pro forma* budgets,

[1] See S. G. Cheng, *Modern China*.

same day the German ships at Shanghai and Amoy were seized by the Chinese authorities, and on the 25th the German minister and his staff left Peking.

The premier and his supporters were now anxious to carry their policy to its logical conclusion and to secure the benefits of complete identification with the cause of the Allies, by declaring war against the Central Powers. A conference of military governors convened by the premier at Peking on April 26 voted decisively for war; a few days later the Cabinet adopted a unanimous resolution to the same effect. But once again the national aspect of the question became submerged in a welter of factional intrigues. The President's party, consisting of a number of Kuo Min-tang parliamentarians, who professed to see in the attitude of the military governors a menace to parliamentary government, and of others alarmed by the increasing rumours of secret agreements between Tuan Chi-jui's party and the Japanese Government, constituted an opposition sufficient to prevent the Cabinet from carrying its resolution into effect. Among the *literati* and disinterested patriotic men there undoubtedly existed a genuine difference of opinion as to the advisability of committing the nation definitely to a policy of hostility to Germany, a difference which was reflected in the conflicting advice publicly given by scholars like Liang Ch'i-ch'ao and Kang Yu-wei. But so far as Parliament was concerned, the question resolved itself into a sordid struggle for power between Tuan Chi-jui, backed by the northern Tuchuns, and his political opponents. At a secret session of the Lower House of Parliament on May 10, it was apparent that the question of war with Germany had become subordinate to that of a combined attack upon Tuan Chi-jui. On May 19 a resolution was adopted to the effect that the House would decline further to consider the question until the Cabinet had been reconstructed. As Tuan's colleagues with one exception had resigned at the first sign of serious trouble, the resolution amounted to a demand for the premier's resignation. Tuan, however, held his ground stoutly and countered the Kuo Min-tang move by a communication from the military governors to the President demanding the immediate dissolution of Parliament, and by the announcement of their intention not to leave the capital until this had been done. Thus challenged, the President issued a mandate (May 23) dismissing the premier and appointing the septuagenarian Wu Ting-fang in his place. Tuan, following the course usual on such occasions, fled from the capital and, taking refuge with the military party's leaders at Tientsin, announced his intention of defying the President's authority. The military governors of several provinces north of the Yangtsze thereupon proceeded to declare their independence of the central Government whilst the Kuo Min-tang leaders, hurriedly leaving the capital for the South, announced their intention of taking up arms in defence of Parliament and the people's liberties. It is typical of the chaotic condition of Chinese affairs that at this juncture Gen. Feng Kuo-chang, the Vice-President, while tendering his resignation, announced that the lower Yangtsze region would remain "neutral."

The struggle thus begun lasted for three months and postponed China's declaration of war against Germany until the middle of August. As it proceeded, it became more and more apparent that the contending factions were not really concerned with any question of political principles, but fighting only for place and power. At the beginning of June, the military governors established a "Provisional Government" of their own at Tientsin with the aged ex-viceroy, Hsü Shih-chang (later President of the republic), cast for the dummy rôle of president-dictator. At the same time they warned Li Yuan-hung that if he desired to remain President, he must submit to their wishes and dissolve Parliament; to enforce their demands they proceeded to mass troops in the vicinity of the capital. Li Yuan-hung sought to gain time by summoning to his aid as "mediator" Gen. Chang Hsün, the famous swashbuckler chieftain of Shantung fame. Gen. Chang promptly came north with a "bodyguard" of several thousand troops, and arrived at Peking on June 12; but the value of his mediation was discounted in advance by the announcement that he would insist upon the dismissal of Parliament, and by rumours of his intention to restore the Manchu dynasty. On June 13 Li Yuan-hung yielded, and Parliament was dissolved by presidential mandate.

The question of joining with the Allies against Germany was now relegated by common consent to the background and all attention concentrated on the struggle of personal ambitions at Peking. Tuan Chi-jui, with his Tuchun supporters, was still in watchful waiting at Tientsin. Parliament had elected a new Premier (Li Ching-hsi) but the attitude of the military party made it an uncomfortable post to fill and he had cautiously declined to assume office. Many of the Kuo Min-tang politicians had fled to Shanghai and Canton and, with the support of the navy, were once more preparing to take the field against Peking. Under these conditions the danger of internal dissensions on a wide scale without definite purpose was unmistakably more serious than at any time since the overthrow of the Manchus. Regarding the matter in this light, the United States addressed a note to the Chinese Government (June 6) deploring the prospect of civil war and intimating that the restoration of national unity was a matter of more immediate importance to China than the declaration of war against the Central Powers. This advice, though morally sound, was politically unfortunate, inasmuch as it was construed and proclaimed by the Kuo Min-tang as an intimation that the U.S. Government was opposed to the policy of Tuan Chi-jui and his military supporters; it therefore resulted in stiffening Young China and the Cantonese Radicals in their uncompromising hostility to the central Government. It was common knowledge that Tuan Chi-jui had framed and pursued his policy in close touch with Japan, and that he relied upon that country for financial support; it was only natural therefore that Young China should look to the United States not only to deliver them from the militarist and monarchist party, but to protect the Chinese republic from Japan.

General Chang Hsün, as the central figure on the Peking stage, soon showed that he had no intention of attempting to bring about a reconciliation between President and premier. His proceedings were so obviously inspired by his own overweening ambitions that it was not long before signs of dissension manifested themselves between him and his colleagues of the military party. When his policy became fully revealed by a *coup de main* (July 1) which withdrew the young Emperor from his retirement and proclaimed the restoration of the Dragon Throne, the chief cause of the opposition which his action promptly evoked from Tuan Chi-jui and the Peiyang military chiefs lay in the fact that he proposed to appoint himself regent and viceroy of Chihli. Few, if any, of those who now denounced Chang Hsün as a traitor to the republic and took the field against him, were in reality opposed to the monarchy (most of them were, in fact, solemnly pledged to support the restoration); but they could not brook the assumption of supreme authority by one who had stolen a march upon them and taken advantage of their divided counsels. Tuan Chi-jui, in particular, was known to be in favour of the monarchy, but only on condition that he himself became viceroy of Chihli and the power behind the throne. Emerging therefore from his retirement at Tientsin, he led his army to the capital to defend the republic. After a few days of desultory and half-hearted fighting, Chang Hsün capitulated (July 12) and the young Emperor was consigned once more, with all due respect, to the tranquil dignity of his court without a kingdom. Chang Hsün's troops were permitted to retire, with the honours of war and three months' pay; their leader, who had found a temporary refuge in the Dutch legation, was left unmolested.

In "vindicating the Republic," Gen. Tuan had received the active support of the Vice-President, Gen. Feng Kuo-chang, commanding the army at Nanking. After the capitulation of Chang Hsün, Tuan resumed the premiership, with powers that were practically those of a dictator, so that the position of Li Yuan-hung as President became impossible. From the Japanese legation, whither he had fled for safety upon the proclamation of the monarchy, he announced his intention of retiring into private life. On July 18 he was succeeded in the presidency by

£10,800,000, that is to say, about 4½ millions more than the sterling equivalent of the Maritime Customs revenue at that date. Between 1917 and 1921, the Boxer indemnity payments having been suspended by the Allied Powers, and the sterling value of the customs and salt revenues more than doubled, the financial resources at the disposal of the Chinese Government were greater than at any previous period. No advantage was taken of this favourable opportunity of reducing the nation's foreign debt; on the contrary, it was materially increased by repeated borrowings from Japan, in the course of which many potential sources of national wealth were recklessly mortgaged. The amount of these loans, chiefly incurred by Premier Tuan's administration between 1916 and 1918, is not definitely known, for the details of several agreements have not been published, but it was estimated at over 200 million yen at the end of 1918. Little, if any, of the money thus raised was devoted to reproductive enterprises; it merely served to increase the numbers and rapacity of the Tuchuns' military forces.

The official "Statement of the Foreign Debts of China," issued by the Government Bureau of Economic Information in Jan. 1920, giving a list of loans and liabilities outstanding at that date, will be found on the following page.

The Bureau estimated the total of obligations outstanding as approximately $657,627,083, but the rate at which exchange was calculated is not stated. (At the rate prevailing in Jan. 1921, the liability in dollars was practically double that of Jan. 1920.) Nor is it clear upon what basis this official statement was compiled, for it contains no reference to a number of railway and other loans, for which the Chinese Government is responsible, and its list of the advances obtained from Japan in recent years is evidently incomplete. The total amount of loans contracted for purposes of railway construction at the end of 1918 was about 40 millions sterling. According to a statement published by the *Peking Leader*, the total amount of foreign loans raised by the republican Government between 1912 and July 1918 was $1,057,900,000; and new loans, to an aggregate of 230 million dollars, were under discussion.

Currency Reform.—In the commercial treaty concluded with Great Britain in 1902, China undertook to create a uniform national coinage. In 1908, the Government considered that the best solution of the matter would be a standard "tael," and orders were issued to the provincial authorities accordingly. In 1910, this plan was abandoned and a 72-candareen dollar was adopted as the standard national coin. In April 1911, an agreement was concluded between the Ministry of Finance and the Four-Power Consortium for a loan of 10 millions sterling, of which 8½ millions were to be used for the reform of the currency, but owing to the outbreak of the revolution, the loan was not floated. In 1912, the establishment of a gold standard was discussed, but in March 1914, the silver dollar was definitely adopted, and in 1915 coins bearing the effigy of Yuan Shih-k'ai were minted at Tientsin in large numbers; there had already been a considerable production of "standard" dollars by the mints at Nanking and Wuchang. A memorandum by the Minister of Finance in 1918 put the total coinage of new dollars (of 89% fineness) between 1914 and 1918 at 184 millions, against which 52 millions of old coins were withdrawn from circulation. The currency law promulgated in March 1914 was intended to secure a limited coinage of dollars and subsidiary decimal coins of fixed values. A code of regulations to this end was adopted by a currency commission advised by Dr. G. Vissering, but the Government authorities themselves failed to observe them and the output of the mints continued to be regulated by the necessities and opportunities of the officials concerned. The copper coinage, in particular, rapidly deteriorated. In Aug. 1918, the Minister of Finance (Tsao Ju-lin) proposed the issue of gold currency notes and the establishment of a currency department under the direct control of the premier. The President endorsed the scheme by mandate, but the opposition was so strong that it was indefinitely postponed.

The chaotic conditions of the metal currency have been aggravated by the fact that numerous native banks and provincial Governments have issued bank-notes, in taels and dollars, for large amounts, uncontrolled and unsecured by bullion reserves, most of which circulate at varying rates of discount. (The Peking notes of the Bank of China and Bank of Communications were quoted at 50% discount in 1919.) During the revolution, moreover, military notes were indiscriminately issued, some of which the Government has since redeemed. The amount of provincial paper money in circulation at the end of 1915 was estimated at $169,000,000. Many foreign banks having branches in China also issue bank-notes within the limits of their charters, which circulate freely in the treaty ports. The number of foreign banks doing business in China has greatly increased, the majority of the newcomers being Japanese and American. In 1921 the Native Bankers' Association at Shanghai was an organization of increasing influence; it restricts its membership to banks conducted on modern lines.

Cheng, *Modern China* (1920).

Agricultural Products.—The principal industry of China is agriculture, and its perpetual function is to produce the rice upon the supply of which staple food depends the survival rate of the population. Such new economic factors as the wide-spread revival of opium-growing (forbidden by imperial edicts and actively suppressed between 1907 and 1911), or the extension of the cotton-growing area due to the successful development of the spinning industry, necessarily involve a corresponding reduction of the home-grown food supply. These changes, unless accompanied by an increase of national wealth sufficient to replace it by purchases from abroad, must expose the nation to increased danger of famine in bad years. According to the report on trade published by the statistical secretary of the Maritime Customs in April, 1920, the cultivation of the poppy had been regularly resumed on a wide scale in several provinces, notably Szechuan, Yünnan, Kueichow and Fukien. Between 1913 and 1920, the area under cotton cultivation steadily increased, in response to the growing demand of the spinning and weaving industries at Shanghai, Hankow, Tientsin and other industrial centres, the chief producing areas being Chihli, western Shantung, Honan, Hupeh, Kiangsi and Chekiang. The total production of raw cotton in 1919 was estimated at 12,000,000 piculs, a figure which placed China third on the list of cotton-producing countries. Simultaneously with these changes in the country's agricultural economics, all calculated to diminish the nation's home-grown food supplies, the extraordinary demand for rice and other foodstuffs in Japan and Siberia, which became acute in 1919, had resulted in a serious shortage of food in many parts of the country, before the bad harvest of 1920 produced a devastating famine in the northeastern provinces. In the summer of 1919, the Japanese competition for rice was so insistent that the south of China was deprived of its customary supplies from Indo-China and Burma; consequently, the staple food of the people rose to unprecedented prices. Other recent features of the agricultural economic situation are the rapid extension of the bean-growing area in Manchuria and the development of wheat cultivation (combined with a steady increase of the flour-milling industry) in N. China and the central Yangtsze provinces. The statistics of the wheat and flour trades are particularly significant, illustrating on the one hand a change in the habits of the Chinese people in certain districts, and on the other, the increasing pressure which has been brought to bear upon China's resources by better organized or wealthier nations. In 1913, the total export of flour was 194,451 piculs; in 1919, it was 2,694,271 piculs, of which Japan and Siberia took each a third. In 1919, Japan and Siberia divided the wheat export amounting to 4,453,471 piculs; in 1913, the total export was 1,848,071 piculs. Similarly, the export of beans in 1919 was nearly 50% higher than in 1913, while that of bean cake rose by 75%, Japan being practically the sole importer of the latter. The manufacture of bean cake and bean oil has become one of China's most profitable industries.

Mining.—The mineral industry in China has advanced but little under the republic and remains, generally speaking, beset by the same difficulties and impediments as those which confronted the first Bureau of Mines in 1898. The fact is noteworthy, not only because of the nature and extent of the country's resources, but because of the seriously increasing financial obligations of its rulers. Under the Manchus, attempts were made to develop valuable mining areas by native enterprise under the direction of officials or merchants, or both combined, but without success. The foreign concession system, subsequently adopted, failed also to attain the desired end, for the reason that the central Government's authority, and even that of the provincial viceroys, was never sufficient to overcome the conservatism or the vested interests of the local officials and gentry. In many cases mining concessions granted to foreign capitalists under the monarchy were either repurchased or invalidated as the result of local opposition, and native mining continued to be conducted on the small-scale claim system and, generally speaking, by primitive methods. (In 1914 it was officially estimated that the amount of coal produced by 4,962 small mine owners was 6,315,000 tons.) No practical steps have been taken to fulfil the undertaking given in the Mackay Treaty (1902) that China would recast her mining rules "in such a way as to offer no impediment to the attraction of foreign capital." The mining regulations issued in 1907, as the result of much pressure from the foreign ministers at Peking, were soon declared to be unworkable; they failed to make definite provision for the operations of large-scale mining by joint-stock companies. Thus, until and after the revolution, matters drifted. In 1913, inspired by a Minister of Commerce (Chang Chien) with some practical knowledge of modern industrial methods, the Government of the republic took up the subject again; the result was a bewildering mass of over 300 mining regulations, issued under seven headings, at various dates between March 1914 and July 1915. By this code the Government for the first time asserted the claim of the State to dispose of all mineral rights, and "no longer to allow landowners to hinder mining development"; at the same time, it reduced the hitherto exorbitant rate of direct taxation levied on the industry. But it still left the miners' produce exposed to export duties and transit taxes amounting to over 10%, in addition to property tax, land tax and output tax.

It was therefore not surprising that the new regulations failed to give any impetus either to mining exploration by foreigners or to new enterprise by native capitalists. In Jan. 1916, the Chinese Government resumed its study of the question; a new code of mining laws, framed on the Canadian model, was drawn up by a special commission under the chairmanship of the Minister of Commerce (Chou Tzu-chi), which included several highly qualified technical experts. It was intended to submit this new code for ratification by Parliament, but with the renewal of civil strife and the passing of Yuan Shih-k'ai, the question was indefinitely shelved. The unwillingness of Chinese officialdom under the republic to encourage any extensive development of mining enterprise by means of foreign capital has evidently been inspired, as it was under the monarchy, by fear that the employment of foreign capital and experts is likely to produce the extension of foreign influence. The chief of the Chinese geological department (V. K. Ting), writing on the subject in May 1917,[1] declared that the chief obstacle to the rapid extension of mining operations by foreigners in China lies in the continuance of their claim to extra-territorial rights; that China cannot afford "to allow people who are outside Chinese jurisdiction to locate mining areas under the claim system." There is indisputable justification for the reluctance of the Chinese to grant to foreigners mining rights which may lead to political complications or involve the nation in loss of strategic or economic advantages. But the fact remains that, while preventing the extension of mining operations by foreigners in areas where no such considerations could arise, the rulers of China under the republic, either under pressure or in return for Japanese subsidies and loans, have parted with many mining rights of great national importance, in the Yangtsze valley and in Manchuria.

The total production of coal in China was estimated in 1913 at 13,190,000 tons; two years later the estimate was 18,000,000 tons, of which 8,000,000 came from mines equipped with modern plant and the rest from small native workings. The amount of coal exported in 1918 was 1,708,149 tons; in 1919, it fell to 1,477,433 tons. The most important coal-producing enterprises are the Kailan Mining Administration (an Anglo-Chinese coöperative company) in Chihli and the Fushun mines (Japanese) in Manchuria, both of which are rapidly expanding. The principal metals which China has so far (1921) been able to produce in quantities sufficient for export are antimony, pig-iron, iron ore and copper. The trade in antimony was stimulated and the price advanced during the war, but in 1919 the demand had greatly diminished. The export of copper decreased greatly in 1918 and almost ceased in 1919, the amount produced being supplemented by the import of about 2,000 tons to meet the country's currency requirements. An important feature in the metal trade of 1919 was the increase in the export of iron ore from the Tayeh mines to Japan, the amount shipped being about 630,000 tons.

Authorities.—H. B. Morse, *Trade and Administration of China* (3rd ed., 1921); Montague Bell and Woodhead, *China Year Book* (1919–20); W. F. Collins, *Mineral Enterprise in China* (1918).

Manufactures.—Notwithstanding the generally disturbed condition of the country, a rapid advance took place in the development of industrial enterprises of all kinds during the first decade of the republic; so much so that, in his report on trade for 1919, the statistical secretary (Inspectorate General of Customs) observed that there were then few foreign type articles of domestic use that were not made in China by factories on modern lines, the majority of them without foreign assistance.

In 1906 there were 14 cotton-spinning mills in China, with a total of 400,000 spindles; in the *China Year Book* for 1919, the number given is 56 (excluding Hongkong) and the list of other mills, factories, etc., contained in the same volume covers 17 pages. With the shortage of raw materials, and the growth of labour troubles in Europe, Chinese capitalists (a class whose numbers and wealth rapidly increased under the Tuchun régime after 1916) and the rich merchants of the treaty ports came to realize after the war how great and lucrative are the opportunities awaiting the industrial development of China, with its vast resources of cheap labour and raw materials, in competition with the manufactures of the West. Japanese capitalists and captains of industry showed themselves equally alive to the possibilities of the situation. As a result, the development of industrial enterprises of many kinds, but especially in textiles, in the period immediately following upon the Armistice was limited only by the impossibility of obtaining the necessary machinery. The statistical secretary's list of articles (1919) manufactured in China includes silk and cotton clothing and underwear; toilet articles; umbrellas; woollen yarn; chemicals; needles; electric lamps; telephone appliances; wine and beer; asbestos articles and window glass. Shipbuilding has been established on a considerable scale at Shanghai and other treaty ports. During 1919 there were 12,307 tons of shipping launched from Chinese yards; in 1920, vessels were sent to Shanghai from England to have their woodwork and fittings completed by Chinese carpenters. Auxiliary to the establishment of native industries, a number of industrial banks were organized on foreign lines by the Chinese in 1919–20. As the result of a contract between the Chinese Government and the Marconi Co., the construction of wireless telegraph stations was commenced in 1919; wireless telephony was also introduced by the Chinese National Wireless Co., using the Marconi patents; but it remains to be seen whether either these or aeroplanes can be made to serve any lasting purpose of public utility in China.

Commerce.—Amongst several noteworthy changes which occurred in the commerce of China during the period 1911–21, the most important were the elimination of the lawful traffic in imported opium, a considerable diversion of general trade from its former lines in favour of America (largely as a result of the World War), and the increasing production and consumption of domestic factory products of foreign type. Remarkable also, considering the disturbed political conditions prevailing, was the increase in the volume and value of China's trade during and after the war. The customs revenue for 1919 exceeded that for 1913 (previously the highest on record) by two million taels, and this despite the elimination of the revenue derived from opium and the very low rate of exchange at which *ad valorem* import duties were paid. In 1920, the record was again surpassed, the amount collected being Tls. 49,500,000 (equivalent at the average exchange of 5s. 7⅜d. to £16,809,000) which was 3½ million taels more than in 1919. The value of the country's trade with foreign countries in 1919 increased by no less than 337 million taels, as compared with the year 1913. The advance was chiefly in exports and due to the imperious demand for foodstuffs and raw materials in Europe; for the first time, the value of China's exports practically balanced her imports. An indication of the prosperity resulting from this profitable activity in exports is to be found in the customs returns of the movements of treasure which show a net import into China of over 50 million taels' worth of gold and 92 million taels of silver during the years 1918–9. The growth of trade is also illustrated by the following figures, which show the sterling value, calculated at the average T.T. exchange for each year, of China's net imports and exports, exclusive of bullion:—

Net	1914	1915	1916
Imports . . .	£74,564,285	£58,939,819	£86,067,833
Exports .	47,116,453	54,321,069	80,299,561
Net	**1917**	**1918**	**1919**
Imports . . .	£119,072,400	£145,658,383	£204,882,599
Exports . . .	110,301,853	127,544,295	199,758,331

Note: The exchange for 1918 was 5s. 3 7/16d. and for 1919 6s. 4d. In 1920 the value of silver began to fall; the rate of exchange averaged 5s. 7⅜d.

The following statistics show the amount of China's direct trade with the foreign countries named, and afford an indication of some of the principal economic changes resulting from the war:—

	Imports		Exports	
	1913 Hk. Taels	*1919 Hk. Taels*	*1913 Hk. Taels*	*1919 Hk. Taels*
Great Britain	96,910,944	64,292,239	16,346,413	57,186,242
Germany .	28,302,403	368	17,025,224	163,886
France . .	5,299,517	3,375,809	40,749,782	34,285,989
Japan . .	119,346,662	246,940,997	65,544,186	195,006,032
Russia (Overland trade). .	12,258,180	1,724,603	3,095,826	5,516,517
U. S. A. .	35,427,198	110,236,706	37,650,301	101,118,677
Hongkong (For transhipment)	171,366,099	153,631,544	117,128,661	131,495,296

The returns of shipping entered and cleared at Chinese ports during 1919 show comparatively little change during and since the war. The figures for the principal foreign nations concerned are as follows:—

Nationality	1913		1919	
	Vessels	Tonnage	Vessels	Tonnage
American . . .	2,458	898,750	4,433	2,569,887
British . . .	32,186	38,120,300	36,074	36,284,312
Norwegian . . .	637	739,328	311	302,959
German . . .	5,382	6,320,466	—	—
French . . .	1,020	1,232,763	471	414,161
Japanese . . .	22,716	23,422,487	27,182	27,532,449

The chief articles of import in 1919 were cotton goods, metals, kerosene oil, sugar, cigars and cigarettes, locomotives and railway cars, machinery, coal, fish, paper and motor-cars. The value of cotton goods imported was 30 million taels more than in 1913, but the weight of the goods was considerably less, a result partly due to high prices and partly to the increasingly effective competition of the products of Chinese mills. The total value of the latter products, passed through the customs for home consumption and export, was Tls. 92,698,787, as against Tls. 24,425,069 in 1913. In spite of the boycott, which remained in force during the greater part of 1919, the importations of Japanese shirtings showed a considerable increase over those of 1918. The following figures illustrate the position of the import trade for 1919, as compared with 1913, and reflect the growth of native industrial enterprise.

not only over the eighteen provinces, but throughout the New Dominion and Manchuria.

The growth of its progressive development and usefulness has been remarkable, in spite of the disturbed conditions and brigandage prevalent throughout most parts of the country since the revolution. During the three years 1916–8, after the death of Yuan Shih-k'ai, postal operations and extensions in many provinces were seriously hampered by the depredations of bandits and lawless soldiery. In Shensi alone, 78 post-offices were looted in 1918. Nevertheless, in that year the number of district offices and agencies had increased to 9,367 (as compared with 5,357 in 1910) employing 27,000 Chinese, with a foreign staff of about 110. The growth of the service is shown by the following figures:—

	1908	1913	1918
Mail matter posted . .	79,882,252	197,484,136	302,269,028
Parcels	623,315	1,380,912	2,738,090

Money orders increased from ten million dollars in 1913 to thirty-five millions in 1918. The earnings of the department in 1918 were $9,500,000 and showed a profit of $1,910,000 over working expenses, as compared with a surplus of $303,000 in 1915. China joined the Postal Union in 1914. On March 1 1917 an agreement was concluded with Great Britain for the direct exchange of postal parcels, and later in the same year a similar arrangement was made with the Russian postal administration for parcels crossing the Russo-Chinese frontier. In 1921 the Treaty Powers still maintained their own post-offices in many places for the despatch and receipt of mails from overseas, and in certain instances the operations of these extra-territorialized establishments, especially in the matter of the parcels post, had worked to the detriment of China's postal service and inland revenues. The number of post-offices maintained by the Powers in 1921 was as follows: Great Britain, 11; France, 15; Japan, 21 in China proper and 23 in Manchuria; Germany (before the war), 17; Russia (before the war), 28; United States, 1. (J. O. P. B.)

CHIROPRACTIC, the name given to a method of healing employed in the United States, based on the theory that most disease is the result of displacement of the vertebrae of the spinal column, resulting in abnormal pressure upon the nerves as they emerge. It is held that the articular joints are frequently thrown out of alignment, it may be only in slight degree, and the constricted nerves are thereby prevented from transmitting to the various bodily organs the mental impulse necessary for proper functioning. The human body has been charted, and it is claimed that the nerves emanating above each vertebra regulate particular organs; hence the cause of different diseases can as a rule be readily localized. Health is possible only when all the organs function harmoniously, and disease of one organ may affect some other. The chiropractor attempts to find the subluxated joint, and with the bared hand to adjust it. He never resorts to drugs or surgery; he merely tries to relieve the impinged nerve and leaves the rest to nature.

The first reported healing by chiropractic was made in 1895, when Dr. D. D. Palmer (b. near Toronto, Canada, March 7 1845; d. at Los Angeles, Cal., Oct. 13 1913), a "magnetic healer," in Iowa treated a man who had been deaf for 17 years. He claimed to have discovered that a displaced vertebra was pinching a certain nerve and that its adjustment was quickly followed by complete restoration of hearing. Little was done to work out a theory in detail until 1903, when Dr. B. J. Palmer (b. Sept. 10 1881), a son of the discoverer, began its formulation, resulting in the development of a well-defined system of articular adjustment with the hands. He established the Palmer School of Chiropractic ("Chiropractic Fountain Head") at Davenport, Ia., which remained the best known, although later many others were founded in different parts of the United States. The course of study extends over three collegiate years of six months each, and the subjects studied correspond with those of the usual medical school, *materia medica* alone being ignored. In 1921 there were about 10,000 chiropractors to be found in some 30 of the United States. In several states they were still debarred from practice, and in others legislation was pending.

CHISHOLM, HUGH (1866–), editor of the *Encyclopaedia Britannica*, was born in London Feb. 22 1866, of Scottish descent. His father, HENRY WILLIAMS CHISHOLM (*see* 25.772), was the son of Henry Chisholm (1769–1832)—private secretary and librarian for many years to Lord Grenville (auditor of the Exchequer: Prime Minister 1806–7), by whom he was given a clerkship in the Exchequer,[1] eventually becoming senior clerk in the Exchequer Bill Office and King's Agent for Sierra Leone and the Gold Coast—whose paternal grandfather had left Inverness-shire and settled in London early in the 18th century. Henry Williams Chisholm (1809–1901) entered the Exchequer in 1824 with a nomination from Lord Grenville, rising to be head of its official staff in 1862 as chief clerk; and on the abolition of the Exchequer in 1866 as a Government department coördinate with the Treasury, he was appointed, under the Weights and Measures Act (1867), head of the newly created Standards Department of the Board of Trade, occupying the old Exchequer office at 7, Old Palace Yard, Westminster, with the official title of Warden of the Standards. At the Exchequer he had become a recognized authority on public finance; and his "Great Account" (*see* 10.58), published in 1869 as a Parliamentary Return in 3 vols., dealing in detail with the history—unrecorded till then—of the public revenue and expenditure of Great Britain and Ireland since 1688, and of the origins of the whole British fiscal system, was the outcome of 10 years' laborious research. As Warden of the Standards he was the British delegate to the International Metric Commission at Paris from 1870 to 1875, and took a leading part, as a member of its permanent scientific committee, in preparing and constructing the newly adopted international standards. At the desire of the Government, his retirement from office was postponed for this purpose till the end of 1876, when he had been 52 years in the public service. His "Recollections of an Octogenarian Civil Servant" were published in *Temple Bar* (Jan. to April 1891).

Educated at Felsted school, and at Oxford as a scholar of Corpus, Hugh Chisholm graduated in 1888 with a first class in *Literae Humaniores*, and then read for the bar, being "called" at the Middle Temple in 1892; but he had already then drifted into London journalism. From 1892 to 1897 he was assistant-editor, and from 1897 to the end of 1899 editor, of the *St. James's Gazette* (*see* 19.561); and during these years he also contributed numerous articles on political, financial and literary subjects to the weekly journals and monthly reviews, becoming well known as a literary critic and Conservative publicist. On resigning the editorship of the *St. James's*, he became a leader-writer for the *Standard*, and later in 1900 was invited to join *The Times*, under whose management he acted as the responsible co-editor, with Sir Donald Mackenzie Wallace and President Hadley of Yale University, of the new volumes, constituting the 10th ed. (1902), of the *Encyclopaedia Britannica*. In 1903 he was appointed editor-in-chief of the 11th ed., which was completed under his direction in 1910, and published as a whole by the Cambridge University Press, in 29 vols., in 1911. He subsequently planned and edited the *Britannica Year-book* (1913). Rejoining *The Times* in 1913 as day-editor, and a director of *The Times* Publishing Co., he became financial editor at the end of that year, and occupied this responsible position all through the momentous period of the World War, resigning his connexion with *The Times* in March 1920 in order to reassume the editorship of the *Encyclopaedia Britannica* and to organize the publication of the New Volumes constituting the 12th edition.

CHOATE, JOSEPH HODGES (1832–1917), American lawyer and diplomat (*see* 6.258), died in New York May 14 1917. Upon the outbreak of the World War he ardently supported the cause of the Allies. He severely criticized President Wilson's hesitation to recommend America's immediate coöperation, but shortly before his death retracted his criticism. He was chairman of the mayor's committee in New York for entertaining the British and French commissions in 1917. His death was hastened by the physical strain of his constant activities in this connexion. Among his last works were *Abraham Lincoln and Other Addresses in England* (1910) and *American Addresses* (1911).

See Edward Sandford Martin, *The Life of Joseph Hodges Choate* (1920).

CHRISTIAN SCIENCE (*see* 6.291).—In 1910 the total number of Christian Science churches was 1,201 (1,077 in the United States, 58 in England, 38 in Canada, 28 elsewhere); on Jan. 1 1920 the number was 1,804 (1,590 in the United States, 98 in England, 46 in Canada, 70 elsewhere). As a Christian Science church invariably has two readers, the one to read the Bible,

[1] A set of the 5th ed. and supplement of the *Encyclopaedia Britannica*, inherited by his son and grandson, was purchased by him out of the allowance made for "stationery" to clerks of the Exchequer in those days—a form of perquisite in addition to salary.

the other to read the text-book (Science and Health with Key to the Scriptures), the number of readers in 1910 was 2,402 and in 1920 was 3,608. Statistics of membership are never issued officially; and in 1921 there was nothing later on the subject than the *Report on Religious Bodies*, published in 1908 by the U. S. Bureau of the Census, showing in the United States in 1906 85,717 members, of whom about 72% were women.

After the death in 1910 of Mary Baker Eddy, the founder and director of the denomination, the board appointed by her became the governing body of the church. Mrs. Eddy's estate, amounting to $2,500,000, was left for the promotion of Christian Science, and in 1914 the trustees announced that the income would be used in providing lectures, in distributing authorized literature throughout the world, in establishing libraries in connexion with churches, societies, and reading-rooms, and, so far as possible, in helping towards the erection of church buildings. Upon the outbreak of the World War in 1914 the Christian Science churches in Paris organized relief activities for war sufferers, and at the end of the year the board of directors of the Mother Church (the First Church of Christ, Scientist, in Boston, Mass.) appointed a War Relief Committee. Funds were raised from their own members and distributed through authorized representatives in the warring countries; up to May 31 1917 the total receipts for relief work were $310,700 of which $264,400 had been forwarded for distribution. In 1917, after the entrance of the United States into the war, a Camp Welfare Committee was appointed, over 100 welfare rooms were opened in the United States, Canada and Great Britain, and approximately $150,000 expended on buildings and equipment. More than 2,000 persons served without compensation as camp welfare workers and in other capacities. The denomination had nine chaplains in the army and one in the navy. The total amount raised for war work approximated $2,000,000.

The decade 1910–20 witnessed considerable dissension within the church. In 1909 the board of directors of the Mother Church in Boston expelled from the church Mrs. Augusta E. Stetson, who since 1890 had been pastor of the First Church of Christ, Scientist, of New York City. It was charged that Mrs. Stetson was using her influence to insure her succession to the headship of the denomination after Mrs. Eddy's death. This was denied by Mrs. Stetson, who in turn charged the directors with promoting a false and materialistic interpretation of Mrs. Eddy's writings. Although defended by a large number of followers, she quietly resigned her New York pastorship. In 1913 she published her side of the case in *Reminiscences, Sermons and Correspondence Proving Adherence to the Principle of Christian Science as Taught by Mary Baker Eddy*. In 1919 a serious dispute arose between the trustees of the Christian Science Publishing Society and the board of directors of the Mother Church. The trustees claimed that the board aimed to create an oligarchy, and was trying to usurp their powers. They denied that they were under the jurisdiction of the board, which, in turn, claimed supreme authority. Through counsel (among whom was Charles E. Hughes) the trustees secured in 1919 a temporary injunction, restraining the board from interfering with the trustees of the publication society. At first the courts seemed to support the contention of the trustees; the majority of the churches apparently sided with the directors. Several cases were reported in which persons associated with the trustees' publications were forbidden by churches to teach in Sunday-schools. The injunction was set aside Nov. 23 1921.

In 1921 the church was issuing the following periodicals: *The Christian Science Quarterly Bible Lessons; The Christian Science Journal*, a monthly; *Der Herold der Christian Science*, a monthly, with pages alternately in English and German; *Le Héraut de Christian Science*, a monthly, with pages alternately in English and French; *The Christian Science Sentinel*, a weekly; and *The Christian Science Monitor*, an excellent international daily, published in Boston.

CHRYSTAL, GEORGE (1851–1911), British mathematician, was born near Aberdeen March 8 1851. He was second wrangler at Cambridge in 1875, and was appointed successively professor of mathematics at St. Andrews in 1877 and at Edinburgh in 1879, holding the latter post till his death. He was the author of a standard treatise on algebra as well as of many publications on physical and mathematical subjects, and his researches into the surface oscillations of Scottish lakes won him a Royal medal from the Royal Society. He died at Edinburgh Nov. 3 1911.

CHURCH, ALFRED JOHN (1829–1912), English classical scholar, was born in London Jan. 29 1829. Educated at King's College, London, and Lincoln College, Oxford, he took holy orders and was assistant-master at Merchant Taylors' school for many years. He was professor of Latin at University College, London, from 1880–8 and, in partnership with W. J. Brodribb, translated Tacitus and edited Pliny's Letters; but he is best known by his English re-telling of classical tales and legends for young people (*Stories from Virgil, Stories from Homer*, etc.). He wrote much Latin and English verse, and in 1908 published his *Memories of Men and Books*. He died at Richmond, Surrey, April 27 1912.

CHURCHILL, WINSTON (1871–), American writer, was born in St. Louis, Nov. 10 1871. He graduated from the U. S. Naval Academy in 1894. He was conspicuous alike in scholarship and in general student activities. He became an expert fencer and he organized at Annapolis the first eight-oared crew, of which he was for two years captain. He had already decided upon a literary career, and after brief service in the navy he resigned and for a time was connected with the *Army and Navy Journal*. In 1895 he became managing editor of the *Cosmopolitan Magazine;* but in less than a year he retired that he might have more time for writing. His first novel, after being twice recast, appeared as *The Celebrity*, in 1898. His next book, *Richard Carvel*, appeared in 1899 and had a sale of almost a million copies. Its scene is Maryland during the American Revolution. His next work, *The Crisis* (1901), opens in St. Louis in the days of the Civil War. The heroine is the great-great-granddaughter of his former hero, Richard Carvel. The intervening period of western expansion, following the Louisiana Purchase, is depicted in *The Crossing* (1904). His other works are: *Coniston* (1906, the career of a *post-bellum* political boss); *Mr. Crewe's Career* (1908, the railroads in politics); *A Modern Chronicle* (1910); *The Inside of the Cup* (1913, the 20th-century Church); *A Far Country* (1915, methods of "big business") and *The Dwelling Place of Light* (1917). All his novels treat of phases of American development, historical or social, and form a sort of chronological sequence. He has written a play in three acts, *Dr. Jonathan* (1919). Mr. Churchill took an active part in state politics. From 1903 to 1905 he was a member of the Legislature of New Hampshire, and in 1912 he was an unsuccessful candidate for governor on the Progressive ticket.

CHURCHILL, WINSTON LEONARD SPENCER (1874–), English statesman (*see* 6.347). Mr. Churchill's tenure of the presidency of the Board of Trade, from April 1908, was marked by the production of a scheme in the autumn of that year for the setting up of a court of arbitration in labour disputes, consisting of three persons nominated by the Board, respectively from panels of employers, workmen and "persons of eminence and impartiality." He also welcomed on behalf of the Government an Eight Hours Miners bill. In 1910 he was promoted to the Home Office. Here he had to deal with the dangers arising from the increasing hordes of undesirable aliens who poured into the East End of London. He was present in person at an extraordinary affray in Sidney St., Mile End Road, on Jan. 3 1911, when the police, after a time reinforced by soldiers, were kept at bay for many hours by two foreign burglars who defended themselves in a house with Mauser pistols, and who ultimately perished when the building caught fire and was burnt.

In the autumn of 1911, to the surprise of the public, an exchange of offices was effected between him and Mr. McKenna, and he became First Lord of the Admiralty. Hitherto he had been wont to pose as a disbeliever in the German menace, and an advocate of reductions in British armaments. In Aug. 1908, for instance, he rebuked Lord Cromer for uttering grave words of warning, and ridiculed the bare possibility of an Anglo-German conflict in arms. Early in 1909 he had assisted Mr. Lloyd George in the Cabinet in his unsuccessful endeavour to cut down Mr.

McKenna's estimates. But the Agadir crisis of July 1911 seems to have opened his eyes as it did those of Mr. Lloyd George. At any rate, he spoke at Guildhall on Lord Mayor's Day in a worthy manner; admitting that the growth of the German navy was a main factor in British construction, and pointing out that no power was better able to bear the strain or less likely to fail than Great Britain. Similarly at Glasgow in Feb. 1912 he submitted that naval power to the Germans was a luxury; it was existence to the English, it was expansion to them. "We shall face the future as our ancestors would have faced it, without disquiet, without arrogance, but in solid and inflexible determination." He had in the previous month announced the establishment of a naval war staff, and in the autumn he reorganized the internal administration of his office. The same tone was maintained in his speech on introducing the naval estimates. If any one nation, he said, were able to back the strongest fleet with an overwhelming army, the whole world would be in jeopardy. Great Britain must never conduct her affairs so that the navy of any one power could engage her at any moment with a reasonable prospect of success. He announced a complete reorganization of the navy, which was to be grouped in four fleets, three being for home defence, based on home ports (the third being the Atlantic fleet previously based on Gibraltar), and the fourth, based on Gibraltar, to operate either in home waters or in the Mediterranean. The significance of this new orientation was at once perceived. It was hailed with satisfaction by the Unionists, but the pure economists complained that he had thrown sobriety and thrift to the winds. These changes were mainly due to the inspiration of Lord Fisher, and of Sir Arthur Wilson, Lord Fisher's successor as First Sea Lord. There was a slight decline of £300,000 in the total of these estimates; but this was merely a pause after the £12,000,000 increase of the past three years; and by the summer a new German navy law necessitated a supplementary estimate of about a million. In 1913 there was a further increase of about a million and a quarter. Once more a supplementary estimate, largely due to aircraft development, added two millions and a half; and in 1914 Mr. Churchill introduced the highest estimates hitherto on record, £51,550,000—an increase on the total of 1913 of some two millions and three-quarters. He grasped, moreover, at an early date the vital importance of oil fuel, and forwarded eagerly the arrangement by which oil was to be obtained for the navy from Persia. Meanwhile, he had thrown out, on the estimates of 1913, a hint to Germany that all naval Powers might well take a year's holiday from shipbuilding; but, though he repeated and emphasized his plea for this "naval holiday" in a speech in the autumn of 1913, it met with no response from Berlin. Large as the estimate for 1914 was, it was attacked by naval experts as inadequate.

There would perhaps have been more general satisfaction with the results of Mr. Churchill's undoubtedly energetic and patriotic administration at the Admiralty, if he had not shown himself so vehement a partisan in internal politics. But he was in the van of controversy over the Parliament bill, over Home Rule, and especially over the Ulster resistance. "Full steam ahead" was his motto for his party in the turbulent session of 1911. In Feb. 1912 he made a daring incursion into Ulster, in order to advocate Home Rule at Belfast; but he was wise enough to give up his original intention of making the Ulster Hall, with its Orange and Protestant associations, the scene of his meeting, and also to represent the Government plan as an integral part of parliamentary devolution. He developed this line of argument when moving the second reading of the Home Rule bill in April, and at Dundee in the autumn outlined a general policy under which England would be cut up into self-governing areas. But both in the House and at Dundee he emphatically declared that Ulster, though she had a claim to special treatment, must not be allowed to bar the way. Next year he declared at Dundee in Oct. that, if a single province could interpose a "bully's veto," constitutional and peaceful agitation would be discredited throughout the British Empire and the civilized world. But the speech which most exasperated his political opponents was one which he delivered at Bradford in March 1914, just after the incident of the Curragh. Against any attempt in action to subvert parliamentary government, there was no lawful measure, he said, from which ministers would or could shrink. If British civil and parliamentary systems were to be brought to the challenge of force, he could only say "Let us go forward together and put these grave matters to the proof." His dispositions of naval forces in the Irish Channel were bitterly resented by the Unionists, who accused him of being in a "plot" to provoke Ulster to armed resistance and then coerce her. In return, he described these accusations as "a vote of censure by the criminal classes on the police," and averred that the measures taken were purely precautionary.

These controversies were stilled by the war. Here Mr. Churchill showed that he appreciated the situation better than the majority of his colleagues. On Monday, July 20, at Spithead, there was a great review by the King of the most powerful fleet ever assembled, numbering some 200 vessels in all, manned by 70,000 officers and men. While the ships were still engaged in tactical exercises, Austria's ultimatum to Serbia was issued (July 23) and the 12 anxious days which culminated in the World War began. In the ordinary course the fleet would have been demobilized at the close of the week; but with the outlook so disturbed, the First Lord and the First Sea Lord (Prince Louis of Battenberg, afterwards Lord Milford Haven) took the responsibility of keeping it on a war footing, ready for action. Hence, when the rupture occurred, the fleet was already at its stations in the North Sea, and Adml. Jellicoe was promptly appointed commander-in-chief. The Expeditionary Force was conveyed across the Channel in perfect safety, and its communications safeguarded; and the German mercantile marine was soon cleared from the seas. But there were some naval disasters for which the public were not prepared. The German battle cruiser "Goeben" eluded the British Mediterranean fleet and got safely into the Sea of Marmora; three British cruisers were sunk by submarines in the North Sea; and a British squadron under Adml. Cradock was heavily defeated by a German squadron off the coast of Chile. Prince Louis of Battenberg, a most patriotic and capable sailor, unjustly attacked because of his German origin, tendered his resignation as First Sea Lord, and Mr. Churchill put in his place the indefatigable veteran, Lord Fisher. Meanwhile Mr. Churchill heartened his countrymen by patriotic speeches at a non-party meeting in the London Opera House in Sept., and at Guildhall in November. He rushed to Antwerp when there were hopes of saving it from the Germans, but though he exerted himself indefatigably both in diplomacy and in the actual work of defence, and sent a British naval division to help, the effort was in vain. When a war council was formed on Nov. 25, he was one of the original members and, along with the Prime Minister and Lord Kitchener, bore the main responsibility. The naval situation was sensibly relieved by the destruction in Dec. by Adml. Sturdee, off the Falkland Islands, of the German squadron which had defeated Cradock, and by a successful action under Adml. Beatty in Feb. 1915 off the Dogger Bank. On the other hand, German sporadic attacks by sea and air on British watering places and the increasing activity of German submarines gave Mr. Churchill and the Admiralty much concern. He determined to treat prisoners captured from submarines, in view of their breaches of the laws of war, with more severity than ordinary prisoners; but the Germans retaliated harshly on the most noteworthy English prisoners in their hands, and Mr. Balfour, on succeeding Mr. Churchill, gave up this discrimination. But Mr. Churchill's great coup in the war was the attack on the Dardanelles, which he pressed forward in spite of the increasing reluctance of Lord Fisher. The idea was a captivating one, and an appeal from the Russians for help in that quarter was difficult to resist. It is arguable, and he was disposed to maintain, that the movement would have succeeded if resolutely pushed by those in command, both in the initial stage, when it was a purely naval attack, and in the later stage, when considerable military forces had been landed and fought many desperate fights. But, in fact, it failed; and the friction engendered between the First Lord and the First Sea Lord was one of the causes which drove

the other to read the text-book (Science and Health with Key to the Scriptures), the number of readers in 1910 was 2,402 and in 1920 was 3,608. Statistics of membership are never issued officially; and in 1921 there was nothing later on the subject than the *Report on Religious Bodies*, published in 1908 by the U. S. Bureau of the Census, showing in the United States in 1906 85,717 members, of whom about 72% were women.

After the death in 1910 of Mary Baker Eddy, the founder and director of the denomination, the board appointed by her became the governing body of the church. Mrs. Eddy's estate, amounting to $2,500,000, was left for the promotion of Christian Science, and in 1914 the trustees announced that the income would be used in providing lectures, in distributing authorized literature throughout the world, in establishing libraries in connexion with churches, societies, and reading-rooms, and, so far as possible, in helping towards the erection of church buildings. Upon the outbreak of the World War in 1914 the Christian Science churches in Paris organized relief activities for war sufferers, and at the end of the year the board of directors of the Mother Church (the First Church of Christ, Scientist, in Boston, Mass.) appointed a War Relief Committee. Funds were raised from their own members and distributed through authorized representatives in the warring countries; up to May 31 1917 the total receipts for relief work were $310,700 of which $264,400 had been forwarded for distribution. In 1917, after the entrance of the United States into the war, a Camp Welfare Committee was appointed, over 100 welfare rooms were opened in the United States, Canada and Great Britain, and approximately $150,000 expended on buildings and equipment. More than 2,000 persons served without compensation as camp welfare workers and in other capacities. The denomination had nine chaplains in the army and one in the navy. The total amount raised for war work approximated $2,000,000.

The decade 1910–20 witnessed considerable dissension within the church. In 1909 the board of directors of the Mother Church in Boston expelled from the church Mrs. Augusta E. Stetson, who since 1890 had been pastor of the First Church of Christ, Scientist, of New York City. It was charged that Mrs. Stetson was using her influence to insure her succession to the headship of the denomination after Mrs. Eddy's death. This was denied by Mrs. Stetson, who in turn charged the directors with promoting a false and materialistic interpretation of Mrs. Eddy's writings. Although defended by a large number of followers, she quietly resigned her New York pastorship. In 1913 she published her side of the case in *Reminiscences, Sermons and Correspondence Proving Adherence to the Principle of Christian Science as Taught by Mary Baker Eddy*. In 1919 a serious dispute arose between the trustees of the Christian Science Publishing Society and the board of directors of the Mother Church. The trustees claimed that the board aimed to create an oligarchy, and was trying to usurp their powers. They denied that they were under the jurisdiction of the board, which, in turn, claimed supreme authority. Through counsel (among whom was Charles E. Hughes) the trustees secured in 1919 a temporary injunction, restraining the board from interfering with the trustees of the publication society. At first the courts seemed to support the contention of the trustees; the majority of the churches apparently sided with the directors. Several cases were reported in which persons associated with the trustees' publications were forbidden by churches to teach in Sunday-schools. The injunction was set aside Nov. 23 1921.

In 1921 the church was issuing the following periodicals: *The Christian Science Quarterly Bible Lessons; The Christian Science Journal*, a monthly; *Der Herold der Christian Science*, a monthly, with pages alternately in English and German; *Le Héraut de Christian Science*, a monthly, with pages alternately in English and French; *The Christian Science Sentinel*, a weekly; and *The Christian Science Monitor*, an excellent international daily, published in Boston.

CHRYSTAL, GEORGE (1851–1911), British mathematician, was born near Aberdeen March 8 1851. He was second wrangler at Cambridge in 1875, and was appointed successively professor of mathematics at St. Andrews in 1877 and at Edinburgh in 1879, holding the latter post till his death. He was the author of a standard treatise on algebra as well as of many publications on physical and mathematical subjects, and his researches into the surface oscillations of Scottish lakes won him a Royal medal from the Royal Society. He died at Edinburgh Nov. 3 1911.

CHURCH, ALFRED JOHN (1829–1912), English classical scholar, was born in London Jan. 29 1829. Educated at King's College, London, and Lincoln College, Oxford, he took holy orders and was assistant-master at Merchant Taylors' school for many years. He was professor of Latin at University College, London, from 1880–8 and, in partnership with W. J. Brodribb, translated Tacitus and edited Pliny's Letters; but he is best known by his English re-telling of classical tales and legends for young people (*Stories from Virgil, Stories from Homer*, etc.). He wrote much Latin and English verse, and in 1908 published his *Memories of Men and Books*. He died at Richmond, Surrey, April 27 1912.

CHURCHILL, WINSTON (1871–), American writer, was born in St. Louis, Nov. 10 1871. He graduated from the U. S. Naval Academy in 1894. He was conspicuous alike in scholarship and in general student activities. He became an expert fencer and he organized at Annapolis the first eight-oared crew, of which he was for two years captain. He had already decided upon a literary career, and after brief service in the navy he resigned and for a time was connected with the *Army and Navy Journal*. In 1895 he became managing editor of the *Cosmopolitan Magazine;* but in less than a year he retired that he might have more time for writing. His first novel, after being twice recast, appeared as *The Celebrity*, in 1898. His next book, *Richard Carvel*, appeared in 1899 and had a sale of almost a million copies. Its scene is Maryland during the American Revolution. His next work, *The Crisis* (1901), opens in St. Louis in the days of the Civil War. The heroine is the great-great-granddaughter of his former hero, Richard Carvel. The intervening period of western expansion, following the Louisiana Purchase, is depicted in *The Crossing* (1904). His other works are: *Coniston* (1906, the career of a *post-bellum* political boss); *Mr. Crewe's Career* (1908, the railroads in politics); *A Modern Chronicle* (1910); *The Inside of the Cup* (1913, the 20th-century Church); *A Far Country* (1915, methods of "big business") and *The Dwelling Place of Light* (1917). All his novels treat of phases of American development, historical or social, and form a sort of chronological sequence. He has written a play in three acts, *Dr. Jonathan* (1919). Mr. Churchill took an active part in state politics. From 1903 to 1905 he was a member of the Legislature of New Hampshire, and in 1912 he was an unsuccessful candidate for governor on the Progressive ticket.

CHURCHILL, WINSTON LEONARD SPENCER (1874–), English statesman (*see* 6.347). Mr. Churchill's tenure of the presidency of the Board of Trade, from April 1908, was marked by the production of a scheme in the autumn of that year for the setting up of a court of arbitration in labour disputes, consisting of three persons nominated by the Board, respectively from panels of employers, workmen and "persons of eminence and impartiality." He also welcomed on behalf of the Government an Eight Hours Miners bill. In 1910 he was promoted to the Home Office. Here he had to deal with the dangers arising from the increasing hordes of undesirable aliens who poured into the East End of London. He was present in person at an extraordinary affray in Sidney St., Mile End Road, on Jan. 3 1911, when the police, after a time reinforced by soldiers, were kept at bay for many hours by two foreign burglars who defended themselves in a house with Mauser pistols, and who ultimately perished when the building caught fire and was burnt.

In the autumn of 1911, to the surprise of the public, an exchange of offices was effected between him and Mr. McKenna, and he became First Lord of the Admiralty. Hitherto he had been wont to pose as a disbeliever in the German menace, and an advocate of reductions in British armaments. In Aug. 1908, for instance, he rebuked Lord Cromer for uttering grave words of warning, and ridiculed the bare possibility of an Anglo-German conflict in arms. Early in 1909 he had assisted Mr. Lloyd George in the Cabinet in his unsuccessful endeavour to cut down Mr.

authority less from the several Churches of that Communion than from individual bishops. Upon her ordination a deaconess will acquire Holy Orders, conferred according to a "form and manner, such as might fitly be included in the Ordinal." The functions of deaconesses are defined as:—"(*a*) To prepare candidates for Baptism and Confirmation. (*b*) To assist at the administration of Holy Baptism, and to be the administrant of that Sacrament in cases of necessity in virtue of her office. (*c*) To pray with and to give counsel to such women as desire help in difficulties and perplexities. (*d*) With the approval of the bishops and of the parish priest, and under such conditions as shall from time to time be laid down by the bishop (i.) in church to read Morning and Evening Prayer and the Litany except such portions as are assigned to the priest only; (ii.) in church also to lead in prayer and, under licence of the bishop, to instruct and exhort the congregation." It should, however, be pointed out that Clause (*d*) (ii.) was passed by a majority only. Women other than deaconesses should have opportunity given them, with the bishop's permission, to speak and lead in prayer both in consecrated and unconsecrated buildings at other than the regular and appointed services of the Church, on the same conditions as men.

Spiritualism, Christian Science, and Theosophy.—The Conference saw "grave dangers in the tendency to make a religion of Spiritualism," the practice of which as a cult "involves the subordination of the intelligence and the will to unknown forces or personalities." The teaching of Christian Science "cannot be reconciled with the fundamental truths of the Christian faith and the teaching of Scripture," since it tends to Pantheistic doctrine, to a false antithesis between spirit and matter, and to the denial of the reality of sin, disease and suffering. The Conference declared that in the positive teaching of Theosophy there are cardinal elements irreconcilable with the faith.

Marriage and Sexual Morality.—"The Conference affirms as our Lord's principle and standard of marriage a life-long and indissoluble union, for better for worse, of one man with one woman, to the exclusion of all others on either side, and calls on all Christian people to maintain and bear witness to this standard. Nevertheless, the Conference admits the right of a national or regional Church within our Communion to deal with cases which fall within the exception mentioned in the record of our Lord's words in St. Matthew's Gospel, under provisions which such Church may lay down." "Grave concern" is expressed at "the spread in modern society of theories and practices hostile to the family," such as the use of unnatural means for the avoidance of conception. In regard to venereal disease, "the Conference must condemn the distribution or use, before exposure to infection, of so-called prophylactics, since these cannot but be regarded as an invitation to vice."

The Church and Industrial Questions.—"An outstanding and pressing duty of the Church is to convince its members of the necessity of nothing less than a fundamental change in the spirit and working of our economic life. This change can only be effected by accepting as the basis of industrial relations the principle of coöperation in service for the common good in place of unrestricted competition for private or sectional advantage."

Christianity and International Relations.—Stress was laid upon the importance of endeavouring to increase international comity and good-will, and of securing their expression by an increased recognition of international law and custom. Steps should immediately be taken to enable the whole Church of Christ to urge upon the peoples of the world the principles of the League of Nations. "We hold that the peace of the world, no less than Christian principle, demands the admission of Germany and other nations into the League of Nations at the earliest moment which the conditions render possible."

Missionary Problems.—It was urged by the Conference that missionary societies and boards should make their work centre in the Church rather than in the mission organization by the establishment of councils and diocesan boards, which should have a real share in financial control and general direction. Liturgical uniformity should not be regarded as a necessity everywhere, *i.e.* the Prayer Book, as the one fixed liturgical model, is inapplicable in many parts of the mission field. It is sufficient that local liturgical forms should retain "those features which are essential to the safeguarding of the unity of the Anglican Communion."

Development of Provinces.—The gradual creation of new ecclesiastical provinces should be encouraged, and each newly-founded diocese should as soon as possible become a constituent member of a province. In the opinion of the Conference four is the minimum number of dioceses to form a province, but no number is too great so long as convenience of consultation is assured. Newly-constituted provinces should have some distinct voice in the elections of their metropolitans.

Self-Government of the Church.—The need of a representative body which, by including laymen, should interpret to the nation the desires of churchpeople and make clear the need for self-government with greater force than was possible to the Houses of Convocation, had been felt in the Church of England for many years. After much discussion and considerable opposition a Representative Church Council was formed in 1904 and endowed with a constitution in the following year. It consisted of the four Houses of Convocation and the two Houses of Laymen. The council, however, had no legal existence and no powers save such as were accorded to it by the good-will of churchpeople. It served a useful temporary purpose and encouraged the growing conviction that the laity were entitled to a much larger share in the councils of the Church, but its lack of authority made it an imperfect instrument, and it soon became clear that nothing short of a statutory body would satisfy the insistent claim for lessened State control. In 1913, therefore, a committee was appointed by the two archbishops "to inquire what changes are advisable in order to secure in the relations of Church and State a fuller expression of the spiritual independence of the Church as well as of the national recognition of religion." This committee unanimously reported that Parliament, owing to modern changes in its memberships, was no longer the right legislative authority for the Church, and that the time was ripe for granting to the Church wider powers of self-government, and presented a scheme for enabling statutory form to be given to four elective bodies, *i.e.* parochial church councils, ruridecanal conferences, diocesan conferences, and a Church council. As we have seen, the germ of the last named already existed in the Representative Church Council. The other three bodies were also in voluntary existence, although the number of parochial church councils was relatively small. In 1917 the scheme was accepted in principle by both Convocations, and in 1919 a further committee appointed by the Representative Church Council presented an amended plan which was finally adopted with one dissentient. In May of that year the Convocations addressed the Crown, asking that legislative authority should be conferred upon the proposed Assembly, and on Dec. 23 1919 the Church of England Assembly (Powers) Act according this authority received the Royal Assent. For this result the active propaganda conducted by the Life and Liberty Movement was largely responsible. The Assembly consists of the whole of the diocesan bishops of England (the House of Bishops), the whole of the members of the two Lower Houses of Convocation (the House of Clergy), and a number of laymen and laywomen proportioned to the size of each diocese, elected for five years by the diocesan conferences (the House of Laity). The three Houses may sit together or separately. Under the Church of England Assembly (Powers) Act (commonly called the Enabling Act), the first two duties of the Assembly were to draw up a constitution for the parochial councils and to take steps for the reform of Convocation.

The Assembly, which met for the first time on June 30 1920, was empowered to legislate by means of bills (technically called Measures) which, after being passed by it, are to be sent to an ecclesiastical committee consisting of 15 members of the House of Lords, appointed by the Lord Chancellor, and 15 members of the House of Commons, appointed by the Speaker. This committee is to consider each measure, and "draft a report

the other to read the text-book (Science and Health with Key to the Scriptures), the number of readers in 1910 was 2,402 and in 1920 was 3,608. Statistics of membership are never issued officially; and in 1921 there was nothing later on the subject than the *Report on Religious Bodies*, published in 1908 by the U. S. Bureau of the Census, showing in the United States in 1906 85,717 members, of whom about 72% were women.

After the death in 1910 of Mary Baker Eddy, the founder and director of the denomination, the board appointed by her became the governing body of the church. Mrs. Eddy's estate, amounting to $2,500,000, was left for the promotion of Christian Science, and in 1914 the trustees announced that the income would be used in providing lectures, in distributing authorized literature throughout the world, in establishing libraries in connexion with churches, societies, and reading-rooms, and, so far as possible, in helping towards the erection of church buildings. Upon the outbreak of the World War in 1914 the Christian Science churches in Paris organized relief activities for war sufferers, and at the end of the year the board of directors of the Mother Church (the First Church of Christ, Scientist, in Boston, Mass.) appointed a War Relief Committee. Funds were raised from their own members and distributed through authorized representatives in the warring countries; up to May 31 1917 the total receipts for relief work were $310,700 of which $264,400 had been forwarded for distribution. In 1917, after the entrance of the United States into the war, a Camp Welfare Committee was appointed, over 100 welfare rooms were opened in the United States, Canada and Great Britain, and approximately $150,000 expended on buildings and equipment. More than 2,000 persons served without compensation as camp welfare workers and in other capacities. The denomination had nine chaplains in the army and one in the navy. The total amount raised for war work approximated $2,000,000.

The decade 1910–20 witnessed considerable dissension within the church. In 1909 the board of directors of the Mother Church in Boston expelled from the church Mrs. Augusta E. Stetson, who since 1890 had been pastor of the First Church of Christ, Scientist, of New York City. It was charged that Mrs. Stetson was using her influence to insure her succession to the headship of the denomination after Mrs. Eddy's death. This was denied by Mrs. Stetson, who in turn charged the directors with promoting a false and materialistic interpretation of Mrs. Eddy's writings. Although defended by a large number of followers, she quietly resigned her New York pastorship. In 1913 she published her side of the case in *Reminiscences, Sermons and Correspondence Proving Adherence to the Principle of Christian Science as Taught by Mary Baker Eddy*. In 1919 a serious dispute arose between the trustees of the Christian Science Publishing Society and the board of directors of the Mother Church. The trustees claimed that the board aimed to create an oligarchy, and was trying to usurp their powers. They denied that they were under the jurisdiction of the board, which, in turn, claimed supreme authority. Through counsel (among whom was Charles E. Hughes) the trustees secured in 1919 a temporary injunction, restraining the board from interfering with the trustees of the publication society. At first the courts seemed to support the contention of the trustees; the majority of the churches apparently sided with the directors. Several cases were reported in which persons associated with the trustees' publications were forbidden by churches to teach in Sunday-schools. The injunction was set aside Nov. 23 1921.

In 1921 the church was issuing the following periodicals: *The Christian Science Quarterly Bible Lessons; The Christian Science Journal*, a monthly; *Der Herold der Christian Science*, a monthly, with pages alternately in English and German; *Le Héraut de Christian Science*, a monthly, with pages alternately in English and French; *The Christian Science Sentinel*, a weekly; and *The Christian Science Monitor*, an excellent international daily, published in Boston.

He was conspicuous alike in scholarship and in general student activities. He became an expert fencer and he organized at Annapolis the first eight-oared crew, of which he was for two years captain. He had already decided upon a literary career, and after brief service in the navy he resigned and for a time was connected with the *Army and Navy Journal*. In 1895 he became managing editor of the *Cosmopolitan Magazine;* but in less than a year he retired that he might have more time for writing. His first novel, after being twice recast, appeared as *The Celebrity*, in 1898. His next book, *Richard Carvel*, appeared in 1899 and had a sale of almost a million copies. Its scene is Maryland during the American Revolution. His next work, *The Crisis* (1901), opens in St. Louis in the days of the Civil War. The heroine is the great-great-granddaughter of his former hero, Richard Carvel. The intervening period of western expansion, following the Louisiana Purchase, is depicted in *The Crossing* (1904). His other works are: *Coniston* (1906, the career of a *post-bellum* political boss); *Mr. Crewe's Career* (1908, the railroads in politics); *A Modern Chronicle* (1910); *The Inside of the Cup* (1913, the 20th-century Church); *A Far Country* (1915, methods of "big business") and *The Dwelling Place of Light* (1917). All his novels treat of phases of American development, historical or social, and form a sort of chronological sequence. He has written a play in three acts, *Dr. Jonathan* (1919). Mr. Churchill took an active part in state politics. From 1903 to 1905 he was a member of the Legislature of New Hampshire, and in 1912 he was an unsuccessful candidate for governor on the Progressive ticket.

CHURCHILL, WINSTON LEONARD SPENCER (1874–), English statesman (*see* 6.347). Mr. Churchill's tenure of the presidency of the Board of Trade, from April 1908, was marked by the production of a scheme in the autumn of that year for the setting up of a court of arbitration in labour disputes, consisting of three persons nominated by the Board, respectively from panels of employers, workmen and "persons of eminence and impartiality." He also welcomed on behalf of the Government an Eight Hours Miners bill. In 1910 he was promoted to the Home Office. Here he had to deal with the dangers arising from the increasing hordes of undesirable aliens who poured into the East End of London. He was present in person at an extraordinary affray in Sidney St., Mile End Road, on Jan. 3 1911, when the police, after a time reinforced by soldiers, were kept at bay for many hours by two foreign burglars who defended themselves in a house with Mauser pistols, and who ultimately perished when the building caught fire and was burnt.

In the autumn of 1911, to the surprise of the public, an exchange of offices was effected between him and Mr. McKenna, and he became First Lord of the Admiralty. Hitherto he had been wont to pose as a disbeliever in the German menace, and an advocate of reductions in British armaments. In Aug. 1908, for instance, he rebuked Lord Cromer for uttering grave words of warning, and ridiculed the bare possibility of an Anglo-German conflict in arms. Early in 1909 he had assisted Mr. Lloyd George in the Cabinet in his unsuccessful endeavour to cut down Mr.

Holy Scripture. It now runs: "Do you unfeignedly believe all the Canonical Scriptures of the Old and New Testaments as given of God to convey to us in many parts and in divers manners the Revelation of Himself which is fulfilled in our Lord Jesus Christ?"

The Scottish Revision.—The Church in Scotland has also revised its Prayer Book, and a tentative revision is now in use. In 1910 the Episcopal Synod prepared a revised Scottish Communion Office, and in the same year the Consultative Council on Church Legislation prepared a schedule of permissive additions to and deviations from the Book of Common Prayer. The new and revised forms were finally sanctioned and came into operation in a permissive form in 1912. In the Communion Office, according to both the Scottish and the English rite, either of which may be used in Scotland, the Commandments may be omitted and replaced by Our Lord's Summary of the Law. The collects for the king may also be omitted. When there are many communicants the words of administration may be said once, the first half of the words only being recited to each person. The mixed chalice and reservation for the sick are authorized by rubric. New Proper Prefaces have been provided for festivals which hitherto lacked them and new collects, Epistles and Gospels for marriages, funerals and other special occasions and for certain festivals. There is now power, with the bishop's consent, to omit the Litany altogether on the three great festivals. Certain portions may be omitted at other times; new suffrages have, however, been added for the king's forces, for missions, and for Parliament. A variety of additional prayers have been added, together with commemorations of the dead. In the Marriage Service the exhortation has been altered and abbreviated, and there are alternative Lessons in the Burial Service. In the Confirmation Service the sign of the cross may be used. Considerable difficulty was experienced in preparing a revised Psalter which should be generally acceptable, but in 1915 a committee appointed by the Scottish bishops produced a new distribution of the Psalms, which is now in permissive use. Its distinct feature is the provision of separate Sunday and week-day courses. The Sunday course allows of the recitation of the whole, with the exception of some of the minatory Psalms, once a year; the week-day cycle is completed every 28 days. A new Lectionary which prescribes Proper Lessons for the eve of festivals and other special occasions, and makes larger use of the Apocrypha, was adopted in 1918. A committee appointed in 1918 by the Consultative Council on Church Legislation to consider further revision of the Prayer Book reported in June 1921, and the Council agreed that a complete new Scottish Prayer Book should be published.

Church Reunion.—The movement which rendered possible the "Appeal" put forth by the Lambeth Conference began definitely in 1910 when the General Convention of the American Episcopal Church resolved unanimously to invite the Christian Communions all over the world to hold a World Conference "for the consideration of questions touching Faith and Order." The World War seriously delayed progress, though much was done to clear the ground. A committee representing the Church of England and the Free Churches produced two interim reports containing a statement of agreement on matters of faith, and a similar statement regarding order, the latter of which accepted the Sacraments of Baptism and the Lord's Supper and recognized that there had been conferred upon "the whole Church" "a ministry of manifold gifts and functions." The questions upon which differences still remained in 1921 were how far the visible society involves uniformity or allows variety in policy, creed, and worship, the conditions, objective and subjective, in the ministration of the Sacraments upon which their validity depends, and whether the ministry derives its authority through an episcopal or a presbyterial succession, or through the community of believers, or by a combination of them. The second interim report recognized that continuity with the historic episcopate should be preserved, but that the episcopate ought to resume a constitutional form. The acceptance of the fact only of episcopacy should be expected, theories as to its character being set aside. "The acceptance of episcopacy on these terms should not involve any Christian community in the necessity of disowning its past, but should enable all to witness and influence as heirs and trustees of types of Christian thought, life, and order not only of value to themselves, but to the Church as a whole." A meeting preliminary to the Conference was held at Geneva in Aug. 1920 at which 40 countries and 70 religious communions were represented, and a Continuation Committee was appointed to make further preparations for the World Conference on Faith and Order. The date of the Conference had not been fixed in June 1921, but the Patriarch of Jerusalem had invited it to meet in the Holy City. Meanwhile there was much domestic discussion on the subject of reunion. The propriety of the exchange of pulpits between ministers of the Church of England and of the Free Churches was hotly debated, but such exchanges were frequently taking place. The most remarkable instances occurred when a Baptist minister preached in Canterbury cathedral on the occasion of a war anniversary, and Dr. Jowett (Congregationalist) preached in Durham cathedral, in each case at the invitation of the dean. In 1919 the Bishop of London formulated a scheme for reunion with the Wesleyan Methodists, the main features of which were that the Wesleyan Church should be a society within the Church; that a certain number of presidents and superintendents should be consecrated bishops, and that ordinations in each Church should be in a form which would satisfy the other. No practical result has yet followed. A conference of Churchmen and Nonconformists at Mansfield College, Oxford, resolved in favour of interchange of pulpits, mutual admission to the Holy Communion, and "acceptance by ministers, serving in any one denomination, who may desire it, of such authorization as shall enable them to minister fully and freely in the churches of other denominations." The Federal Council of the Evangelical Free Churches has expressed a desire to discuss with representatives of the Anglican Communion the proposals of the Lambeth Conference for the avoidance of misunderstandings.

Reform of Church Finance.—The chaotic condition of the finances of the Church of England, the overlapping and waste of effort resulting from innumerable more or less isolated endeavours to accomplish a given end, the existence of many societies with aims and policies of their own, led in 1909 to the appointment of the Archbishops' Committee on Church Finance. After more than two years' inquiry and deliberation this Committee reported in 1911, and its recommendations were subsequently carried into effect. The keynote of the report was the recommendation that the diocese and not the parish should be the unit of Church life and that responsibility for the work of the Church should be brought home to every member. There is now a Board of Finance in every diocese elected by and affiliated to the Diocesan Conference. These boards arrange a system for the assessment of every parish according to its means and population. There is a Central Incorporated Board of Finance, a Committee of Maintenance of the Clergy and a Central Advisory Council on Training for the Ministry. These general provisions include arrangements present or prospective for recruiting and training ordination candidates who are unable in whole or in part to provide the cost of their own education; for maintaining the ministry by the endowment and augmentation of benefices, etc.; for the provision of clergy pensions; for providing for the widows and children of the clergy and making grants to clergy in difficulties through misfortune; for the erection of new churches and other parochial buildings, and the repair of those already existing. The most noteworthy result is that the Church of England now possesses, for the first time in its history, a legal corporate existence. A bequest of money to "The Church of England" is now valid and effective; previous to these important rearrangements it would have been void, since under English law no one was entitled to give a receipt on behalf of the Church as a corporate body. So soon as it was in working order (in the autumn of 1918) the Central Board of Finance began an attempt to raise a central fund of £5,000,000 for the maintenance of the clergy,

the other to read the text-book (Science and Health with Key to the Scriptures), the number of readers in 1910 was 2,402 and in 1920 was 3,608. Statistics of membership are never issued officially; and in 1921 there was nothing later on the subject than the *Report on Religious Bodies*, published in 1908 by the U. S. Bureau of the Census, showing in the United States in 1906 85,717 members, of whom about 72% were women.

After the death in 1910 of Mary Baker Eddy, the founder and director of the denomination, the board appointed by her became the governing body of the church. Mrs. Eddy's estate, amounting to $2,500,000, was left for the promotion of Christian Science, and in 1914 the trustees announced that the income would be used in providing lectures, in distributing authorized literature throughout the world, in establishing libraries in connexion with churches, societies, and reading-rooms, and, so far as possible, in helping towards the erection of church buildings. Upon the outbreak of the World War in 1914 the Christian Science churches in Paris organized relief activities for war sufferers, and at the end of the year the board of directors of the Mother Church (the First Church of Christ, Scientist, in Boston, Mass.) appointed a War Relief Committee. Funds were raised from their own members and distributed through authorized representatives in the warring countries; up to May 31 1917 the total receipts for relief work were $310,700 of which $264,400 had been forwarded for distribution. In 1917, after the entrance of the United States into the war, a Camp Welfare Committee was appointed, over 100 welfare rooms were opened in the United States, Canada and Great Britain, and approximately $150,000 expended on buildings and equipment. More than 2,000 persons served without compensation as camp welfare workers and in other capacities. The denomination had nine chaplains in the army and one in the navy. The total amount raised for war work approximated $2,000,000.

The decade 1910–20 witnessed considerable dissension within the church. In 1909 the board of directors of the Mother Church in Boston expelled from the church Mrs. Augusta E. Stetson, who since 1890 had been pastor of the First Church of Christ, Scientist, of New York City. It was charged that Mrs. Stetson was using her influence to insure her succession to the headship of the denomination after Mrs. Eddy's death. This was denied by Mrs. Stetson, who in turn charged the directors with promoting a false and materialistic interpretation of Mrs. Eddy's writings. Although defended by a large number of followers, she quietly resigned her New York pastorship. In 1913 she published her side of the case in *Reminiscences, Sermons and Correspondence Proving Adherence to the Principle of Christian Science as Taught by Mary Baker Eddy*. In 1919 a serious dispute arose between the trustees of the Christian Science Publishing Society and the board of directors of the Mother Church. The trustees claimed that the board aimed to create an oligarchy, and was trying to usurp their powers. They denied that they were under the jurisdiction of the board, which, in turn, claimed supreme authority. Through counsel (among whom was Charles E. Hughes) the trustees secured in 1919 a temporary injunction, restraining the board from interfering with the trustees of the publication society. At first the courts seemed to support the contention of the trustees; the majority of the churches apparently sided with the directors. Several cases were reported in which persons associated with the trustees' publications were forbidden by churches to teach in Sunday-schools. The injunction was set aside Nov. 23 1921.

In 1921 the church was issuing the following periodicals: *The Christian Science Quarterly Bible Lessons; The Christian Science Journal*, a monthly; *Der Herold der Christian Science*, a monthly, with pages alternately in English and German; *Le Héraut de Christian Science*, a monthly, with pages alternately in English and French; *The Christian Science Sentinel*, a weekly; and *The Christian Science Monitor*, an excellent international daily, published in Boston.

CHRYSTAL, GEORGE (1851–1911), British mathematician, was born near Aberdeen March 8 1851. He was second wrangler at Cambridge in 1875, and was appointed successively professor of mathematics at St. Andrews in 1877 and at Edinburgh in 1879, holding the latter post till his death. He was the author of a standard treatise on algebra as well as of many publications on physical and mathematical subjects, and his researches into the surface oscillations of Scottish lakes won him a Royal medal from the Royal Society. He died at Edinburgh Nov. 3 1911.

CHURCH, ALFRED JOHN (1829–1912), English classical scholar, was born in London Jan. 29 1829. Educated at King's College, London, and Lincoln College, Oxford, he took holy orders and was assistant-master at Merchant Taylors' school for many years. He was professor of Latin at University College, London, from 1880–8 and, in partnership with W. J. Brodribb, translated Tacitus and edited Pliny's Letters; but he is best known by his English re-telling of classical tales and legends for young people (*Stories from Virgil, Stories from Homer*, etc.). He wrote much Latin and English verse, and in 1908 published his *Memories of Men and Books*. He died at Richmond, Surrey, April 27 1912.

CHURCHILL, WINSTON (1871–), American writer, was born in St. Louis, Nov. 10 1871. He graduated from the U. S. Naval Academy in 1894. He was conspicuous alike in scholarship and in general student activities. He became an expert fencer and he organized at Annapolis the first eight-oared crew, of which he was for two years captain. He had already decided upon a literary career, and after brief service in the navy he resigned and for a time was connected with the *Army and Navy Journal*. In 1895 he became managing editor of the *Cosmopolitan Magazine*; but in less than a year he retired that he might have more time for writing. His first novel, after being twice recast, appeared as *The Celebrity*, in 1898. His next book, *Richard Carvel*, appeared in 1899 and had a sale of almost a million copies. Its scene is Maryland during the American Revolution. His next work, *The Crisis* (1901), opens in St. Louis in the days of the Civil War. The heroine is the great-great-granddaughter of his former hero, Richard Carvel. The intervening period of western expansion, following the Louisiana Purchase, is depicted in *The Crossing* (1904). His other works are: *Coniston* (1906, the career of a *post-bellum* political boss); *Mr. Crewe's Career* (1908, the railroads in politics); *A Modern Chronicle* (1910); *The Inside of the Cup* (1913, the 20th-century Church); *A Far Country* (1915, methods of "big business") and *The Dwelling Place of Light* (1917). All his novels treat of phases of American development, historical or social, and form a sort of chronological sequence. He has written a play in three acts, *Dr. Jonathan* (1919). Mr. Churchill took an active part in state politics. From 1903 to 1905 he was a member of the Legislature of New Hampshire, and in 1912 he was an unsuccessful candidate for governor on the Progressive ticket.

CHURCHILL, WINSTON LEONARD SPENCER (1874–), English statesman (*see* 6.347). Mr. Churchill's tenure of the presidency of the Board of Trade, from April 1908, was marked by the production of a scheme in the autumn of that year for the setting up of a court of arbitration in labour disputes, consisting of three persons nominated by the Board, respectively from panels of employers, workmen and "persons of eminence and impartiality." He also welcomed on behalf of the Government an Eight Hours Miners bill. In 1910 he was promoted to the Home Office. Here he had to deal with the dangers arising from the increasing hordes of undesirable aliens who poured into the East End of London. He was present in person at an extraordinary affray in Sidney St., Mile End Road, on Jan. 3 1911, when the police, after a time reinforced by soldiers, were kept at bay for many hours by two foreign burglars who defended themselves in a house with Mauser pistols, and who ultimately perished when the building caught fire and was burnt.

In the autumn of 1911, to the surprise of the public, an exchange of offices was effected between him and Mr. McKenna, and he became First Lord of the Admiralty. Hitherto he had been wont to pose as a disbeliever in the German menace, and an advocate of reductions in British armaments. In Aug. 1908, for instance, he rebuked Lord Cromer for uttering grave words of warning, and ridiculed the bare possibility of an Anglo-German conflict in arms. Early in 1909 he had assisted Mr. Lloyd George in the Cabinet in his unsuccessful endeavour to cut down Mr.

of that year 60 missionaries, representing the different missionary societies working in British East Africa, met at the Church of Scotland station at Kikuyu, on the Uganda railway, to discuss the possibility of a federation between the Christian bodies working in that region. Among those present were the Bishop of Uganda, who presided, and the Bishop of Mombasa; representatives of the Church of Scotland; the (American) Africa Inland Mission; the Friends' Industrial Mission; the United Methodists; the Lutheran Mission, and the Seventh-Day Adventists. The Conference adopted a "constitution," the preamble of which declared that "with a view to ultimate union of the native Churches, a federation of missionary societies should be formed." The "constitution" settled the following basis of federation: "The loyal acceptance of the Holy Scriptures as our supreme rule of faith and practice; of the Apostles' and Nicene Creeds as a general expression of fundamental Christian belief, and in particular belief in the absolute authority of Holy Scripture as the Word of God, in the Deity of Jesus Christ, and in the atoning death of our Lord as the ground of our forgiveness; recognition of common membership between the Churches in the federation; regular administration of the two Sacraments, Baptism and the Lord's Supper, by outward signs; a common form of Church organization." At the end of the conference there was a corporate Communion celebrated by the Bishop of Mombasa, in which the whole of the delegates participated. The inevitable storm speedily broke. In Nov. the Bishop of Zanzibar published an open letter to the Bishop of St. Albans entitled "*Ecclesia Anglicana:* what does she stand for?" in which, declaring that "there has not been a conference of such importance to the life of the *Ecclesia Anglicana* since the Reformation," he charged the Bishops of Mombasa and Uganda with heresy, and asked for the judgment of his fellow bishops of the Province of Canterbury upon what had happened. The Bishop of Uganda immediately replied, defending his action and explaining that the corporate Communion was an exceptional incident standing apart from any general scheme of federation. After further controversy the Archbishop of Canterbury, having refused to take proceedings for heresy and schism against the incriminated bishops, referred the subject to the Central Consultative Body of the Lambeth Conference, which consisted of 14 bishops representing various parts of the Anglican Communion. The following is a summary of the decisions (April 1915) of this body, which actually consisted of the Archbishops of York, Armagh, the West Indies, Rupert's Land, and the Primus of Scotland, the Bishops of Winchester, Exeter and Gibraltar, Bishops Copleston, Wallis, and Ryle:—

"Ministers recognized in their own bodies may be welcomed as visitors to preach in Anglican churches provided they are accredited by the Diocesan Bishop. 2. Non-Anglicans may be admitted to the Holy Communion at the discretion of the Diocesan Bishops, on condition of the acceptance of the Apostles' and Nicene Creeds, the absolute authority of Scripture as the Word of God, and the Deity of our Lord. 3. Anglicans must not receive the Holy Communion from ministers not episcopally ordained or whose orders are otherwise irregular."

With reference to the corporate Communion, the Consultative Body, while recognizing that it was an abnormal and spontaneous act of devotion, added that "any attempt to treat it as a precedent, or to encourage habitual action of the kind, must be held to be inconsistent with principles accepted by the Church of England. . . . So far from promoting unity it would, in our judgment, rather imperil the measure of unity which we now possess." Meanwhile the Bishop of Zanzibar had renounced communion with the Bishop of Hereford (Dr. Percival) on the ground that he had given a Canonry in his cathedral to the Rev. B. H. Streeter, who was accused of "Modernist" teaching. Prolonged controversy followed both of these events, in the course of which in 1917 the bishops of the Province of South Africa, assembled in Synod, criticised the Kikuyu scheme on the grounds that it dealt exclusively with natives and ignored the essential difficulties between the various denominations, and that more could be done "by holding fast to Catholic order" than "by laxity and compromise." In July 1918 another conference was held at Kikuyu at which an "alliance of missionary societies in British East Africa" was concluded, after an alternative scheme for a united Church, as distinguished from an alliance, proposed by the Bishop of Zanzibar, had been rejected. The alliance consists of the Church Missionary Society, the British and Foreign Bible Society, the Church of Scotland Mission, the United Methodists, and the Africa Inland Mission. The societies forming the alliance pledge themselves to respect one another's spheres, and the autonomy of each member of the alliance within its own sphere; to foster the desire for union; to develop local Church organizations along similar lines of councils, parochial and district; to recognize the status of each other's Church members; to discourage proselytizing; and to respect the disciplinary decisions of the allied societies regarding their own members.

Increase of the Episcopate.—The movement for the division of unwieldy dioceses has resulted since 1914 in the erection of five new sees. In that year there were created: Sheffield (taken from York); Chelmsford (taken from St. Albans); and St. Edmundsbury and Ipswich (taken from Norwich and Ely). In 1918 the diocese of Coventry was formed (taken from Birmingham and Worcester); and in 1920 that of Bradford (taken from Ripon and Wakefield). A committee appointed by the Archbishop of Canterbury prepared a comprehensive scheme for the division of large dioceses in the Southern Province, and several proposals to this end took more or less practical shape. A committee was considering in 1921 the best means of dividing London into two or three bishoprics, and a similar project was being prepared for Winchester, which presents peculiar difficulties owing to the complexities of a convenient division and the impossibility of a bishop with a reduced income living at Farnham Castle. In Manchester a diocese of Preston was to be carved out of the mother see. It was proposed to divide the diocese of Oxford into three portions, roughly coextensive with the three counties—Oxford, Berkshire, and Buckinghamshire—of which it mainly consists, with new see towns at Reading for Berkshire and Aylesbury for Buckinghamshire, but the scheme made only slow progress. It was hoped to form a Shropshire diocese by the division of Lichfield, to relieve Southwell by taking from it the county of Derby, and to form a diocese of Plymouth from that of Exeter. Meanwhile the necessity for increased episcopal supervision was being inadequately met by the erection of new suffragan bishoprics. There were in 1921 42 dioceses in England and Wales.

The Supply of Clergy.—The scarcity of clergy, which had been growing annually more acute, was accentuated by the war. But the possibilities of obtaining candidates from the services after the end of the war seemed to be so favourable that in 1917 a Service Candidates' Committee was formed for the training of ordinands who had served in the forces. By the time it got into working order the Church was short of 2,000 clergy. The disused prison at Kutsford in Cheshire was taken over as a school for the testing of vocations and intellectual fitness, and by the end of 1920 more than 1,500 men were at work and nearly 250 others had been ordained. The supply of ex-service men being exhausted, civilian candidates are now (1921) being tested there. There has been a necessary postponement of the intention of the bishops to enforce a higher standard of education by requiring candidates for Holy Orders to possess a recognized degree and to have undergone at least one year's training at a theological college. Meanwhile an agitation began in 1914 in favour of the admission of women to the priesthood, and in 1916 the Central Council of the National Mission of Repentance and Hope gave a general approval to the "women's movement." In 1917 Miss Maude Royden, one of the leaders of the movement, began a ministry of preaching, first at the City Temple and subsequently in a hall taken for the purpose; in 1921, after preaching the Three Hours' addresses on Good Friday at St. Botolph's, Bishopsgate, she acquired a chapel of her own. In a large number of dioceses women messengers and pilgrims are at work under the guidance of the parochial clergy.

The Church and the State.—At the beginning of 1918 there was a lively controversy upon the appointment of Dr. H. Hensley Henson, Dean of Durham, to the bishopric of Hereford, and a public meeting of churchmen in London asked that the Crown should appoint "a small Commission of Churchmen to assist in the exercise of its ecclesiastical patronage." In 1920 Canterbury Convocation resolved that the two archbishops ought to be consulted by the Prime Minister before he submitted names for appointment to bishoprics. The Prime Minister replied that it had been his "invariable practice" to do so. In consequence of the rapid increase in the value of tithe rent charge by reason of the high prices of agricultural produce, an Act was passed in 1918 fixing the value at £109 3s. 11d. until 1926. The increase in local rates caused a determined agitation against the rating of tithe rent charge, on the ground that it is professional income, and that no other earned income is rated, which led in 1920 to the passing of the Ecclesiastical Tithe Rent Charge (Rates) Act. Under this measure the rates are restricted, during the

the other to read the text-book (Science and Health with Key to the Scriptures), the number of readers in 1910 was 2,402 and in 1920 was 3,608. Statistics of membership are never issued officially; and in 1921 there was nothing later on the subject than the *Report on Religious Bodies*, published in 1908 by the U. S. Bureau of the Census, showing in the United States in 1906 85,717 members, of whom about 72% were women.

After the death in 1910 of Mary Baker Eddy, the founder and director of the denomination, the board appointed by her became the governing body of the church. Mrs. Eddy's estate, amounting to $2,500,000, was left for the promotion of Christian Science, and in 1914 the trustees announced that the income would be used in providing lectures, in distributing authorized literature throughout the world, in establishing libraries in connexion with churches, societies, and reading-rooms, and, so far as possible, in helping towards the erection of church buildings. Upon the outbreak of the World War in 1914 the Christian Science churches in Paris organized relief activities for war sufferers, and at the end of the year the board of directors of the Mother Church (the First Church of Christ, Scientist, in Boston, Mass.) appointed a War Relief Committee. Funds were raised from their own members and distributed through authorized representatives in the warring countries; up to May 31 1917 the total receipts for relief work were $310,700 of which $264,400 had been forwarded for distribution. In 1917, after the entrance of the United States into the war, a Camp Welfare Committee was appointed, over 100 welfare rooms were opened in the United States, Canada and Great Britain, and approximately $150,000 expended on buildings and equipment. More than 2,000 persons served without compensation as camp welfare workers and in other capacities. The denomination had nine chaplains in the army and one in the navy. The total amount raised for war work approximated $2,000,000.

The decade 1910–20 witnessed considerable dissension within the church. In 1909 the board of directors of the Mother Church in Boston expelled from the church Mrs. Augusta E. Stetson, who since 1890 had been pastor of the First Church of Christ, Scientist, of New York City. It was charged that Mrs. Stetson was using her influence to insure her succession to the headship of the denomination after Mrs. Eddy's death. This was denied by Mrs. Stetson, who in turn charged the directors with promoting a false and materialistic interpretation of Mrs. Eddy's writings. Although defended by a large number of followers, she quietly resigned her New York pastorship. In 1913 she published her side of the case in *Reminiscences, Sermons and Correspondence Proving Adherence to the Principle of Christian Science as Taught by Mary Baker Eddy*. In 1919 a serious dispute arose between the trustees of the Christian Science Publishing Society and the board of directors of the Mother Church. The trustees claimed that the board aimed to create an oligarchy, and was trying to usurp their powers. They denied that they were under the jurisdiction of the board, which, in turn, claimed supreme authority. Through counsel (among whom was Charles E. Hughes) the trustees secured in 1919 a temporary injunction, restraining the board from interfering with the trustees of the publication society. At first the courts seemed to support the contention of the trustees; the majority of the churches apparently sided with the directors. Several cases were reported in which persons associated with the trustees' publications were forbidden by churches to teach in Sunday-schools. The injunction was set aside Nov. 23 1921.

In 1921 the church was issuing the following periodicals: *The Christian Science Quarterly Bible Lessons; The Christian Science Journal*, a monthly; *Der Herold der Christian Science*, a monthly, with pages alternately in English and German; *Le Héraut de Christian Science*, a monthly, with pages alternately in English and French; *The Christian Science Sentinel*, a weekly; and *The Christian Science Monitor*, an excellent international daily, published in Boston.

CHURCH, ALFRED JOHN (1829–1912), English classical scholar, was born in London Jan. 29 1829. Educated at King's College, London, and Lincoln College, Oxford, he took holy orders and was assistant-master at Merchant Taylors' school for many years. He was professor of Latin at University College, London, from 1880–8 and, in partnership with W. J. Brodribb, translated Tacitus and edited Pliny's Letters; but he is best known by his English re-telling of classical tales and legends for young people (*Stories from Virgil, Stories from Homer*, etc.). He wrote much Latin and English verse, and in 1908 published his *Memories of Men and Books*. He died at Richmond, Surrey, April 27 1912.

CHURCHILL, WINSTON (1871–   ), American writer, was born in St. Louis, Nov. 10 1871. He graduated from the U. S. Naval Academy in 1894. He was conspicuous alike in scholarship and in general student activities. He became an expert fencer and he organized at Annapolis the first eight-oared crew, of which he was for two years captain. He had already decided upon a literary career, and after brief service in the navy he resigned and for a time was connected with the *Army and Navy Journal*. In 1895 he became managing editor of the *Cosmopolitan Magazine*; but in less than a year he retired that he might have more time for writing. His first novel, after being twice recast, appeared as *The Celebrity*, in 1898. His next book, *Richard Carvel*, appeared in 1899 and had a sale of almost a million copies. Its scene is Maryland during the American Revolution. His next work, *The Crisis* (1901), opens in St. Louis in the days of the Civil War. The heroine is the great-great-granddaughter of his former hero, Richard Carvel. The intervening period of western expansion, following the Louisiana Purchase, is depicted in *The Crossing* (1904). His other works are: *Coniston* (1906, the career of a *post-bellum* political boss); *Mr. Crewe's Career* (1908, the railroads in politics); *A Modern Chronicle* (1910); *The Inside of the Cup* (1913, the 20th-century Church); *A Far Country* (1915, methods of "big business") and *The Dwelling Place of Light* (1917). All his novels treat of phases of American development, historical or social, and form a sort of chronological sequence. He has written a play in three acts, *Dr. Jonathan* (1919). Mr. Churchill took an active part in state politics. From 1903 to 1905 he was a member of the Legislature of New Hampshire, and in 1912 he was an unsuccessful candidate for governor on the Progressive ticket.

CHURCHILL, WINSTON LEONARD SPENCER (1874–   ), English statesman (*see* 6.347). Mr. Churchill's tenure of the presidency of the Board of Trade, from April 1908, was marked by the production of a scheme in the autumn of that year for the setting up of a court of arbitration in labour disputes, consisting of three persons nominated by the Board, respectively from panels of employers, workmen and "persons of eminence and impartiality." He also welcomed on behalf of the Government an Eight Hours Miners bill. In 1910 he was promoted to the Home Office. Here he had to deal with the dangers arising from the increasing hordes of undesirable aliens who poured into the East End of London. He was present in person at an extraordinary affray in Sidney St., Mile End Road, on Jan. 3 1911, when the police, after a time reinforced by soldiers, were kept at bay for many hours by two foreign burglars who defended themselves in a house with Mauser pistols, and who ultimately perished when the building caught fire and was burnt.

In the autumn of 1911, to the surprise of the public, an exchange of offices was effected between him and Mr. McKenna, and he became First Lord of the Admiralty. Hitherto he had been wont to pose as a disbeliever in the German menace, and an advocate of reductions in British armaments. In Aug. 1908, for instance, he rebuked Lord Cromer for uttering grave words of warning, and ridiculed the bare possibility of an Anglo-German conflict in arms. Early in 1909 he had assisted Mr. Lloyd George in the Cabinet in his unsuccessful endeavour to cut down Mr.

Southern Rhodesia. The missionary diocese of Western Equatorial Africa (originally the Niger) was divided in 1919, the diocese of Lagos being carved out of it. Khartum cathedral was consecrated in 1912. A missionary diocese of Egypt and the Sudan was created in 1920; the cathedral, to be erected at Cairo, is intended to be a memorial of Lord Kitchener, Lord Cromer, and the men of the Imperial forces who fell in Gallipoli and Egypt during the World War.

China and Japan.—In 1909 a new diocese of Kwangsi and Hunan was formed out of the diocese of Victoria; the new diocese of Honan has also been formed and allocated to the Canadian Church. Archdeacon T. S. Sing, the first Chinese to be raised to the Episcopate, was in 1918 consecrated Assistant Bishop for the diocese of Chekiang. In 1909 the Missionary Church in China took the name of "The Holy Catholic Church of China," and in 1913 constitutions and canons and a general synod were formed. In 1912 a theological college for training native candidates was established. The American Church has been asked to work the new diocese of N.E. Japan, to be formed by the division of the diocese of N. Tokyo.

Miscellaneous Events.—In 1916 an elaborately organized National Mission of Repentance and Hope took place, the object of which was compendiously stated to be the inducement of "a serious determination on the part of the nation to seek and deserve divine help." It was otherwise described as "a mission of witness by the Church as a whole to the nation as a whole." After various stages of preparation, the "Message to the Nation" was delivered during a few days in each parish by a large body of "Bishops' messengers," consisting of clergy and laity, some of the latter being women. Subsequent stages continued in 1917, and many committees were appointed to consider outstanding subjects arising out of the mission, such as public worship, evangelistic work, problems of industrial life, the teaching office of the Church, etc. The reports of these committees, although some of them have provoked much criticism, have been generally regarded as of greater practical importance than the immediate results of the mission itself. In 1917 a similar mission was held in Scotland. These events were followed by an "Anglo-Catholic Congress" in 1920, the purpose and aim of which were officially defined as "to extend the knowledge of Catholic faith and practice at home and abroad, and by this means to bring men and women to a true realization of our Lord Jesus Christ as their personal Saviour and King." Fourteen thousand members took part, and the subjects discussed (with many sub-headings to each) were "The Message of the Church," "Our Position," "Christian Unity," "Corporate Religion," "Personal Religion," and "The Church and Social and Industrial Problems." Before the year was out £36,000 had been raised towards a thankoffering of £50,000 for foreign missions. The work of the Congress was continued by a "Conference of Catholic Priests" at Oxford in July 1921. The Church Congress kept its jubilee in 1910 at Cambridge, its birthplace; in 1914 it was for the first time intromitted on account of the war, and not resumed until 1919, when it met at Leicester.

BIBLIOGRAPHY.—Many books of importance in theology and Biblical criticism, or as reflecting the development of opinion and the results of scholarship, were published between 1910 and 1921. Among them may be mentioned the following: *Foundations: A Statement of Christian Belief in Terms of Modern Thought* (1912), by Seven Oxford Men; B. H. Streeter, *Restatement and Reunion* (1914); W. Sanday, *The Primitive Church and Reunion* (1913); F. W. Puller, *The Continuity of the Church of England* (1913); A. Nairne, *The Epistle of Priesthood* (1913); S. Baring Gould, *The Church Revival* (1914) and *The Evangelical Revival* (1920); J. N. Figgis, *Churches in the Modern State* (1913); Edouard Naville, *The Archaeology of the Old Testament* (1913); H. Latimer Jackson, *The Eschatology of Jesus* (1913) and *The Problem of the Fourth Gospel* (1918); James Gairdner, *Lollardry and the Reformation* (1908–13); J. R. Illingworth, *The Gospel Miracles* (1915); A. C. Headlam, *The Miracles of the New Testament* (1914); F. E. Brightman, *The English Rite* (1915); T. A. Lacey, *Unity and Schism* (1917); J. K. Mozley, *The Christian Hope in the Apocalypse* (1915); H. B. Swete, *The Holy Catholic Church* (1915); G. H. Box, *The Virgin Birth of Jesus* (1916); *Correspondence of John Henry Newman with John Keble and others 1839–1845;* William Temple, *Mens Creatix* (1917); H. M. Gwatkin, *Church and State in England to the Death of Queen Anne* (1917); J. N. Figgis, *The Will to Freedom* (1917); J. P. Whitney, *The Episcopate and the Reformation* (1917); M. G. Glazebrook, *The Faith of a Modern Churchman* (1918); *Essays on the Early History of the Church and the Ministry* (1918), ed. H. B. Swete; Charles Gore, *Dominant Ideas and Corrective Principles* (1918); J. H. Shakespeare, *The Churches at the Cross Roads* (1918); H. Rashdall, *The Idea of Atonement in Christian Theology* (1919); W. R. Inge, *Outspoken Essays* (1920); Oscar D. Watkins, *A History of Penance* (1920); A. C. Headlam, *The Doctrine of the Church and Christian Reunion* (1920); Kirsopp Lake, *Landmarks in the History of Early Christianity* (1920); R. H. Charles, *The Apocalypse* (1921). (J. P.-B.)

II. ROMAN CATHOLIC CHURCH

The decade 1910–20, including the last four years of the pontificate of Pius X. and the first six years of that of Benedict XV., proved an eventful period for the Catholic Church.

The Church and the Civil Power.—Several interesting questions in the relations of the Church to the civil power were put to the test of practical working.

In France the friction between the Vatican and the French Republic had resulted in 1905 in the separation of Church and State and the rupture of diplomatic relations. It had followed upon the refusal of Pius X. to permit the effective intervention of the French Government in the trial and removal of two French bishops in a matter of purely ecclesiastical discipline. The bill of separation enabled the State to take possession of Church property and to withdraw the subsidy for the clergy. It placed the upkeep of the Church in the hands of voluntary parochial corporations (*associations cultuelles*) which to a large extent would have been subject to the control and supervision of the civil authority. Pius X. declared the refusal of the Church to accept such conditions, and the French bishops, as a body, although menaced with the loss of their incomes, their dwellings, seminaries, and funds vested for religious and charitable purposes, supported the Pope in his refusal. A compromise, which would have turned the *associations cultuelles* into *associations canonico-légales*, was proposed and would, it is said, have found favour with a large number of the bishops, as apparently safeguarding sufficiently the liberty of the Church, but when the Holy See affirmed the safeguards to be inadequate, and declined to sanction it, the French episcopate unanimously accepted its decision, and affirmed its readiness to face any sacrifice rather than that of Church freedom and unity.

During the fifteen years before 1920 the Church in France had to maintain itself upon the voluntary offerings of the faithful, and the result of the experiment may be said to be that, despite manifold losses and difficulties, it has entered upon a new era of vigour and freedom. The State no longer presents to the bishoprics, and the Holy See is free to select and appoint bishops of its own choice in consultation with the bishops of the province. In fact, just as the Concordats with Francis I. in 1516 and Napoleon I. in 1801 practically superseded or abolished capitular election, and substituted nomination or presentation by the head of the State, leaving institution or effective appointment to the Pope, so now the abolition of the Concordat has led to the adoption of what may be called the List system, which promises to be the method of the future, not only in France but in all countries in which there is no longer the union of Church and State. By this arrangement, a list of priests who by their qualifications are reputed to be eligible for promotion to bishoprics is kept at Rome, and is drawn up in consultation with the local episcopate. When sees become vacant the Holy See fills them from the persons so nominated, on the advice of the Consistorial Congregation. The procedure to some extent marks a new era in the history of methods of episcopal appointment. Thus on Feb. 25 1905 Pius X. himself consecrated in St. Peter's at Rome no less than 14 bishops thus chosen for vacant French bishoprics. At the same time the abolition of the Concordat has freed the hands of the bishops from many civil formalities or restraints in the government and organization of their dioceses. A notable example of this liberty and progress has been seen in Paris, where the late Cardinal Amette, before his death in 1920, was able to found some 32 new parish churches in the environs of the city. Clerical authorities, notably the well-informed *Annuaire Pontifical Catholique* of 1915, describe the Church of France, 10 years after its separation from the State, as gaining in energy, influence and freedom. Although the State shows no disposition to depart in any respect from the policy of separation, its attitude to the Church, especially from the outset of the World War, has been in many ways more friendly, based on the higher policy of the *Union Sacrée*, and in 1920 the French Government passed a bill for the renewal of diplomatic relations with the Pope and restored the French embassy at the Holy See, while a papal nuncio was once more to be sent to Paris.

A much more violent case of separation of Church and State was that which was effected by the revolution in Portugal

the other to read the text-book (Science and Health with Key to the Scriptures), the number of readers in 1910 was 2,402 and in 1920 was 3,608. Statistics of membership are never issued officially; and in 1921 there was nothing later on the subject than the *Report on Religious Bodies*, published in 1908 by the U. S. Bureau of the Census, showing in the United States in 1906 85,717 members, of whom about 72% were women.

After the death in 1910 of Mary Baker Eddy, the founder and director of the denomination, the board appointed by her became the governing body of the church. Mrs. Eddy's estate, amounting to $2,500,000, was left for the promotion of Christian Science, and in 1914 the trustees announced that the income would be used in providing lectures, in distributing authorized literature throughout the world, in establishing libraries in connexion with churches, societies, and reading-rooms, and, so far as possible, in helping towards the erection of church buildings. Upon the outbreak of the World War in 1914 the Christian Science churches in Paris organized relief activities for war sufferers, and at the end of the year the board of directors of the Mother Church (the First Church of Christ, Scientist, in Boston, Mass.) appointed a War Relief Committee. Funds were raised from their own members and distributed through authorized representatives in the warring countries; up to May 31 1917 the total receipts for relief work were $310,700 of which $264,400 had been forwarded for distribution. In 1917, after the entrance of the United States into the war, a Camp Welfare Committee was appointed, over 100 welfare rooms were opened in the United States, Canada and Great Britain, and approximately $150,000 expended on buildings and equipment. More than 2,000 persons served without compensation as camp welfare workers and in other capacities. The denomination had nine chaplains in the army and one in the navy. The total amount raised for war work approximated $2,000,000.

The decade 1910–20 witnessed considerable dissension within the church. In 1909 the board of directors of the Mother Church in Boston expelled from the church Mrs. Augusta E. Stetson, who since 1890 had been pastor of the First Church of Christ, Scientist, of New York City. It was charged that Mrs. Stetson was using her influence to insure her succession to the headship of the denomination after Mrs. Eddy's death. This was denied by Mrs. Stetson, who in turn charged the directors with promoting a false and materialistic interpretation of Mrs. Eddy's writings. Although defended by a large number of followers, she quietly resigned her New York pastorship. In 1913 she published her side of the case in *Reminiscences, Sermons and Correspondence Proving Adherence to the Principle of Christian Science as Taught by Mary Baker Eddy*. In 1919 a serious dispute arose between the trustees of the Christian Science Publishing Society and the board of directors of the Mother Church. The trustees claimed that the board aimed to create an oligarchy, and was trying to usurp their powers. They denied that they were under the jurisdiction of the board, which, in turn, claimed supreme authority. Through counsel (among whom was Charles E. Hughes) the trustees secured in 1919 a temporary injunction, restraining the board from interfering with the trustees of the publication society. At first the courts seemed to support the contention of the trustees; the majority of the churches apparently sided with the directors. Several cases were reported in which persons associated with the trustees' publications were forbidden by churches to teach in Sunday-schools. The injunction was set aside Nov. 23 1921.

In 1921 the church was issuing the following periodicals: *The Christian Science Quarterly Bible Lessons; The Christian Science Journal*, a monthly; *Der Herold der Christian Science*, a monthly, with pages alternately in English and German; *Le Héraut de Christian Science*, a monthly, with pages alternately in English and French; *The Christian Science Sentinel*, a weekly; and *The Christian Science Monitor*, an excellent international daily, published in Boston.

CHRYSTAL, GEORGE (1851–1911), British mathematician, was born near Aberdeen March 8 1851. He was second wrangler at Cambridge, in 1875, and was appointed successively professor of mathematics at St. Andrews in 1877 and at Edinburgh in 1879, holding the latter post till his death. He was the author of a standard treatise on algebra as well as of many publications on physical and mathematical subjects, and his researches into the surface oscillations of Scottish lakes won him a Royal medal from the Royal Society. He died at Edinburgh Nov. 3 1911.

CHURCH, ALFRED JOHN (1829–1912), English classical scholar, was born in London Jan. 29 1829. Educated at King's College, London, and Lincoln College, Oxford, he took holy orders and was assistant-master at Merchant Taylors' school for many years. He was professor of Latin at University College, London, from 1880–8 and, in partnership with W. J. Brodribb, translated Tacitus and edited Pliny's Letters; but he is best known by his English re-telling of classical tales and legends for young people (*Stories from Virgil, Stories from Homer*, etc.). He wrote much Latin and English verse, and in 1908 published his *Memories of Men and Books*. He died at Richmond, Surrey, April 27 1912.

CHURCHILL, WINSTON (1871–), American writer, was born in St. Louis, Nov. 10 1871. He graduated from the U. S. Naval Academy in 1894. He was conspicuous alike in scholarship and in general student activities. He became an expert fencer and he organized at Annapolis the first eight-oared crew, of which he was for two years captain. He had already decided upon a literary career, and after brief service in the navy he resigned and for a time was connected with the *Army and Navy Journal*. In 1895 he became managing editor of the *Cosmopolitan Magazine;* but in less than a year he retired that he might have more time for writing. His first novel, after being twice recast, appeared as *The Celebrity*, in 1898. His next book, *Richard Carvel*, appeared in 1899 and had a sale of almost a million copies. Its scene is Maryland during the American Revolution. His next work, *The Crisis* (1901), opens in St. Louis in the days of the Civil War. The heroine is the great-great-granddaughter of his former hero, Richard Carvel. The intervening period of western expansion, following the Louisiana Purchase, is depicted in *The Crossing* (1904). His other works are: *Coniston* (1906, the career of a *post-bellum* political boss); *Mr. Crewe's Career* (1908, the railroads in politics); *A Modern Chronicle* (1910); *The Inside of the Cup* (1913, the 20th-century Church); *A Far Country* (1915, methods of "big business") and *The Dwelling Place of Light* (1917). All his novels treat of phases of American development, historical or social, and form a sort of chronological sequence. He has written a play in three acts, *Dr. Jonathan* (1919). Mr. Churchill took an active part in state politics. From 1903 to 1905 he was a member of the Legislature of New Hampshire, and in 1912 he was an unsuccessful candidate for governor on the Progressive ticket.

CHURCHILL, WINSTON LEONARD SPENCER (1874–), English statesman (*see* 6.347). Mr. Churchill's tenure of the presidency of the Board of Trade, from April 1908, was marked by the production of a scheme in the autumn of that year for the setting up of a court of arbitration in labour disputes, consisting of three persons nominated by the Board, respectively from panels of employers, workmen and "persons of eminence and impartiality." He also welcomed on behalf of the Government an Eight Hours Miners bill. In 1910 he was promoted to the Home Office. Here he had to deal with the dangers arising from the increasing hordes of undesirable aliens who poured into the East End of London. He was present in person at an extraordinary affray in Sidney St., Mile End Road, on Jan. 3 1911, when the police, after a time reinforced by soldiers, were kept at bay for many hours by two foreign burglars who defended themselves in a house with Mauser pistols, and who ultimately perished when the building caught fire and was burnt.

In the autumn of 1911, to the surprise of the public, an exchange of offices was effected between him and Mr. McKenna, and he became First Lord of the Admiralty. Hitherto he had been wont to pose as a disbeliever in the German menace, and an advocate of reductions in British armaments. In Aug. 1908, for instance, he rebuked Lord Cromer for uttering grave words of warning, and ridiculed the bare possibility of an Anglo-German conflict in arms. Early in 1909 he had assisted Mr. Lloyd George in the Cabinet in his unsuccessful endeavour to cut down Mr.

The Church and the "Exclusiva."—An event which will be noted by ecclesiastical jurists and students of the relations of Church and State, the abolition of the Veto or *Jus Exclusivae,* was solemnly decreed by Pius X. in 1904, and carried out in the Conclave of 1914.

For some centuries past three Catholic powers—Austria, France and Spain—had claimed each to have the right to intervene in the election of a Pope by excluding one cardinal from being elected to the papacy. Save that it barred the succession of someone regarded as personally hostile, the intervention was generally ineffective, as the veto of the civil power was restricted to one cardinal, and this exclusion usually had the result of transferring to some other cardinal of like views and temperament the votes which had been given to the person excluded. Certain writers have supposed that the veto had its origin in the action of the emperors in the Middle Ages who at times confirmed the elections made by the cardinals. Later and fuller research has shown that the practice, at least in its direct form, dates only from the middle of the 17th century. Before that time the sovereigns of the nations mentioned frequently exercised influence upon the cardinals living within their dominions and urged them to form a coalition by which a given candidate, deemed to be obnoxious, might be prevented from having the two-thirds majority required for election. In 1590 the Spanish ambassador even presented a list of candidates who alone would be acceptable to Philip II. So far, the veto was an attempt to sway the electorate, but towards the end of the 17th century it took the direct form of a communication to the Cardinal Protector of the nation concerned, or to the Dean of the Sacred College, expressly excluding a given cardinal, irrespective of the numbers who might be ready to vote for him. The conclave frequently took note of such representations and, as a matter of friendly dealing with the Catholic power from which they emanated, abstained from electing the person excluded, but it is held that the Holy See, while tolerating the practice, has never officially recognized this right of intervention, and has more than once warned the Sacred College to ignore it. In 1721 and in 1732 Cardinal Imperiali was successfully vetoed, first by Austria and then by Spain. In more recent times Austria sent its veto against Cardinal Mastai Ferretti (Pius IX.), but the envoy arrived too late, and the Pope was already elected. In the conclave which was held on the death of Leo XIII. in 1903 Cardinal Rampolla was on the verge of having the required number of votes when Cardinal Puzyna, to the great surprise and displeasure of the assembly, delivered in the name of the Emperor Francis Joseph the veto against his election. This step on the part of the aged emperor is known to have been inspired and carried out by the Foreign Minister, Count Goluchowski, who had been hostile to Cardinal Rampolla when he was nuncio at Vienna. To save the Holy See from diplomatic friction, Cardinal Rampolla, under protest, withdrew his candidature, and his supporters, at his request, transferred their votes to Cardinal Sarto, who as Pius X. succeeded to the papacy. One of the first acts of Pius X. was to issue a solemn constitution (*Commissum Nobis*) in Jan. 1904 abolishing forever the Veto or *Jus Exclusivae,* declaring excommunicated by the fact any cardinal who in future would act as bearer of any such communication to the Conclave, and requiring from all cardinals taking part in the election of a pope an oath that they will disregard all such acts of intervention on the part of the civil power. In 1914 Benedict XV. was elected under this constitution, and the historic Veto has disappeared as an influence in the elections to the papacy.

Organic Expansion.—Next to the regulation of her relations to the civil power, and her diplomatic activities, may be considered the organic work of the Church. Both are intended to clear the field and smooth the way to spiritual efficiency and progress in her diocesan and parochial centres. In this domain may be included the creation of new dioceses and spheres of missionary enterprise. To understand the statistics of the Church's expansion it may be noted that, while a missionary area has still to be evangelized, and is yet in the earliest stage of organization, the Holy See marks out its territory, and places its missionary forces under a prefect-apostolic, who is not a bishop, but has ample powers of jurisdiction. Later on, when it has sufficiently advanced in the number of its churches and Catholic population, it is made into a vicariate under a vicar apostolic, a bishop who has delegated authority from the Pope, and has his episcopal title from some ancient or obsolete see, and is classed as a titular bishop, or what was formerly called a bishop *in partibus infidelium.* Finally, when the work of the Church has become stable and substantial, the vicariate is erected into a diocese, and its bishop, no longer a mere delegate of the pope, becomes an ordinary, invested with full canonical rights and title, and the see takes its place amongst the residential bishoprics of the Catholic Church. With these three stages in mind, one may fairly measure the Church's organic expansion by the fact that, during 1910–20, there were erected in various parts of the world 29 prefectures apostolic, 41 vicariates apostolic, and 71 new dioceses—altogether 141 territorial units added in the geography of the Church.

As to what are known as the foreign missions of the Church, the field is too vast for exact statistics. The following summary, taken from official sources published in 1918, and stated here in round numbers, may be taken as substantially correct for contemporary purposes.

The number of priests in the mission field is about 12,000, of whom more than 4,000 are natives. They have as helpers about 3,000 lay brothers and about 20,000 nuns. This forms a missionary army of nearly 35,000 workers. To these must be added a body of more than 34,000 catechists and native teachers. The number of the Catholic people in these missions amounts to 17,000,000. Of these, 13,000,000 are in Asia; 1,000,000 in Africa; 13,000 in Australia; 200,000 in Oceania; 230,000 in North American missions, and 1,000,000 in the missions to natives in South America. It is estimated that in the Catholic mission field there have been founded about 1,700 schools, in which are being educated more than 800,000 pupils. These figures represent broadly the missionary work of the Catholic Church.

The work of the foreign missions was seriously affected by the World War of 1914–8. The contributions to their finances from the devastated and from the blockaded countries were naturally diminished, while many of the younger missionaries were recalled to the colours to take part in the contest. No little dislocation of work was caused by the removal of German or Austrian missionaries, as the Holy See, anxious to protect the cause of the missions from being prejudiced by any suspicion of political propaganda, entered into agreements with the Allies by which, in many cases, missionaries who were subjects of the Central Powers were replaced in India and in the conquered German colonies by others who belonged to one or other of the Allied nationalities. Nevertheless, on the whole, most of the missions were numerically stronger after the war.

Organic Reform.—Simultaneously with this organic expansion of the Church abroad there took place a notable organic reform at her centre. In June 1908 Pius X. decreed an important reconstruction of the Roman Curia, which may be described as the ruling body of the Holy See. The Roman Curia includes about a dozen departments of Church government, called "Congregations." These are standing commissions charged to deal respectively with matters of doctrine, discipline, worship, episcopal appointments, foreign missions, relations to Oriental churches, and other spheres of ecclesiastical administration. Each is presided over by a cardinal-prefect, who is assisted by a number of other cardinals, and, under them, by a trained council of canonists, theologians and consultors of expert authority. Their decisions, which mostly take the form of answers to questions or petitions addressed to them from various parts of the Catholic world, are issued as decrees, and these, when ratified by the approval of the pope, become part of the authoritative law of the Church. The constitution of Pius X. (*Sapienti Consilio*) maintained the continuity of the congregations and tribunals, but effected changes in their structure and working greater than any which had been attempted since the days of Sixtus V. in 1587. With the constitution were issued 34 canons, which regulate more clearly the distribution of work and go to secure greater efficiency and promptitude in procedure (*see* 7.639).

Amongst the alterations thus introduced is notably one which deeply interests Catholics in the English-speaking world. After the Reformation, Catholics in England, Ireland, Scotland and in the United States and Canada were classed amongst those of the missionary countries, and were placed under the charge of the Great Congregation of the Propaganda, which controls the missionary work of the Church in all parts of the world, and whose cardinal-prefect is, for that reason, sometimes styled "the Red Pope." Even when the episcopal hierarchy was preserved or restored in these countries, their business at Rome was transacted by the Propaganda, their bishops were appointed by apostolic briefs which it obtained for the purpose, and it was to it that they made the reports of their dioceses when they went to Rome on their periodic visits *ad limina Apostolorum.* By the new constitution all these countries (and with them Holland and Luxemburg) were withdrawn from the care of Propaganda and were transferred to the Consistorial, the congregation which deals with the Church in non-missionary lands, and are to have the same status and ordinary government as the Church in Catholic countries. Although in several of these nations the Catholic population is still in a minority, their bishops will deal with the Holy See through the Consistorial, and be appointed and

preconized in Papal Consistory, and render to it an account of their stewardship, in the same way as the bishops of Italy, France, Austria, Spain or other parts of the world where the bulk of the population is Catholic.

This historic measure is based on the recognition of the progress of the Church in the countries mentioned. It is reckoned that there are now some 12,000,000 of Catholics in the British Empire. There are 17,000,000 in the United States and 5,000,000 in the Philippines, making 22,000,000 under the Stars and Stripes and, in round numbers, about 34,000,000 of the English-speaking world. This total forms more than a ninth part of the whole Catholic Church.

Restoration of the Rota.—Another important feature of the same constitution completed by the brief has been the restoration of the well-known Court of the Rota. All who have engaged in the study of mediaeval history are familiar with this famous tribunal which was for centuries the supreme court of ecclesiastical appeal for the universal Church. It was this court that in final instance adjudged those cases of appeal to Rome which are found in such numbers in the records of every Catholic country, especially during the Middle and later Middle Ages. Such cases cast a vivid light on the state and working of the mediaeval Church, and students of Church history of the school of Maitland, Othenthal or Dr. Sägmüller have found how necessary for a true understanding of them is the knowledge of the methods and procedure of the Rota and the Chancery.

The Rota consisted of a dean and 12 judges, or auditors (usually chosen from the various nationalities), with a large attendant body of advocates and notaries. Each case was heard by a panel or "turn" of three judges. If a litigant was dissatisfied with the decision he could have the case tried anew, or even a third time by a fresh "turn" of three other judges, one of whom could be chosen by himself, and the other two by the judge thus selected. When two or three of the judgments thus given were concordant, the case was definitely settled. (Hence the clause: "After a third definitive sentence," so often found in the records of appeals in the pre-Reformation centuries.) In the later Middle Ages the volume of judicial business in the Rota was very considerable, but in later times it was notably reduced, as the Holy See had extended and encouraged the system of having cases tried "extra-judicially" by judges delegate, acting by papal authority, but chosen by the litigants themselves, and adjudicating in their own country, as may be seen in numberless entries in the volumes of the *Calendar of Papal Letters* relating to Great Britain.

Pius X. restored the Rota to its ancient preëminence as the chief court of the Catholic Church. It has now a dean, and 10 instead of 12 judges, but its procedure by "turns" or successive sentences on appeal remains substantially unaltered. It is in this tribunal that appeals on matrimonial cases are heard from all parts of the Catholic world, and amongst them such *causes célèbres* as that of Parkhurst and Reid, and Miss Anna Gould and the Marquis Boni de Castellane, who, after strenuous efforts, have failed to obtain a verdict of nullity upon their marriages. A further appeal from the Rota now lies to the commission of judges in the *Apostolica Segnatura*, insomuch as the latter acts as a court of cassation, and takes cognizance of defects of procedure.

As the Catholic Church condemns the doctrine of divorce, in the sense that any marriage between Christians that has been validly contracted and consummated can be dissolved by anything but the death of one of the parties, the matrimonial cases justiciable in the Rota or the Segnatura are only those in which a plea is brought against validity of the marriage, and is put forward to prove that, for reasons good in Divine or Church law, the bond of matrimony never existed. A modern feature of the restored Rota is that condensed reports of the leading trials are published in the official *Acta Apostolicae Sedis*, with a summary of the facts (*Compendium Facti*) and of the juridical principles involved (*Compendium Juris*).

Reconstruction in England and Wales.—The same policy of reconstruction was applied to the Catholic Church in England. At the restoration of the hierarchy in 1850 the whole of England was included in a single province, having its archiepiscopal see at Westminster. On Oct. 28 1911 Pius X., after consultation with the English bishops, issued a constitution (*Si qua est*), in which, after reciting the distribution of sees made by his predecessors Gregory I. and Pius IX., he divided the Catholic Church in England and Wales into three provinces, with archiepiscopal sees at Westminster, Birmingham and Liverpool. Westminster retained as suffragan sees the dioceses of Northampton, Nottingham, Portsmouth and Southwark. To Birmingham were assigned Clifton, Plymouth and Shrewsbury and the two dioceses of Menevia and Newport which included Wales. To Liverpool were given the sees of Hexham, Leeds, Middlesborough and Salford. The Archbishop of Westminster and his successors were declared to be perpetual presidents of the episcopate, with the right to wear their pallium, and to be preceded by their cross in any part of England and Wales, to preside at all meetings of the bishops, and to represent them in any dealings with the civil Government of the country, having first consulted their suffragans and accepted the decision of the majority. A further development of this plan was effected five years later, when Benedict XV., by a Bull of Feb. 7 1916 (*Cambria*), erected Wales into a new and separate province, transferred the see of Newport to Cardiff, and raised it to an archbishopric, with Menevia as its suffragan.

The motive underlying this change is best expressed in the opening clause of the Bull:—"Wales, by the Celtic origin of its people, its language, customs and traditions, is so different from the rest of England that it needs, even in its ecclesiastical order, to be taken apart from the other dioceses and to be given its own hierarchy." It has been pointed out that these words are the recognition and fulfilment of a claim which was made by the canons of St. David's in the year 1145, when they petitioned Pope Eugenius III. to make Wales a distinct ecclesiastical province and to grant the pallium to its archbishop.

The Church and Doctrine.—The action of the Church in matters of doctrine included chiefly the continuance of her conflict with "modernism," which had been condemned by Pius X. in his Encyclical (*Pascendi*) of Sept. 7 1907. This was followed up and reinforced by a *Motu Proprio*, addressed to the whole Church (*Sacrorum Antistitum*) on Sept. 1 1910.

The Encyclical contained an elaborate exposition of the views put forward by the chief modernist writers, who for several years previously had carried on an active propaganda, mainly amongst the priests and seminarists in France and Italy and, to a smaller extent, in England and America. The ostensible object of the movement was to win recognition for a restatement of religion and the Catholic faith in such a form that it might be made acceptable to men holding the most advanced opinions outside the Catholic Church. The attention of the Pope was drawn to their utterances by several councils of bishops, and, after a full examination of their literature, the Holy See arrived at the conclusion that, in pursuing their end, they had essentially altered the meaning of the Catholic doctrines which they professed to explain. Such concepts as "religion," "faith," "revelation," "dogma," "sacraments," "authority," "the Person of Christ," were set forth in a sense alien and contrary to that which is taught by the Catholic Church. Pius X. vigorously condemned the whole system as "a summary of all the heresies" and ordered rigorous measures to be taken to secure its elimination from the fold.

The *Motu Proprio* of 1910 emphasized the decision of the Encyclical, and prescribed further steps for the exclusion of all modernist doctrines, requiring that holders of ecclesiastical offices or dignities should take an oath and make a specific profession of faith for this purpose.

In the course of the years that followed, the "modernist" movement, in view of this condemnation, practically ceased to trouble the peace of the Church. Of its three chief leaders, Father Tyrrell in England, the Abbé Loisy in France, and the Abbate Murri, who was the exponent of its political and social activities in Italy, the first died in 1909, and was buried outside the Church; the second, who had already abandoned his belief in the Godhead of Christ, was excommunicated; the third laid aside his priesthood and shared the same fate. Some friends of the movement had entertained the hope that, on the death of Pius X. and the accession of a new pope, the reprobation of their views might in some degree be modified and "the storm pass over," but one of the first acts of Benedict XV., in his Encyclical *ad Beatissimi*, addressed to the episcopate of the whole Catholic world, was to renew the condemnation of "modernism," denouncing its "monstrous errors" as a "collection of all the heresies," describing the movement in the words of Job (xxxi. 12) as "a fire that devoureth even to destruction and rooteth up all things that spring," and warning the faithful not only against its teaching but against its spirit. The effect has been to indicate that if modernism has a future it must be one that will be outside the Catholic Church.

The Church and the Social Question.—In relation to socialism and the economic questions which arise out of the contending claims of capital and labour, the main lines of direction to Catholic thought and action had been laid down in the Encyc-

licals of Leo XIII. In these there were two chief points which entered into the Catholic position. The first was that man by nature has a right to possess private property, and that the right as natural and vested in the individual lies at the root of all social economy. The second is that the labourer has a right to a "living wage," and by this is distinctly meant a wage "sufficient to enable him to maintain himself, his wife, and children in reasonable comfort" and put by sufficient savings "to secure a small income." The noteworthy feature of this second point is that the living wage is taken as the fundamental postulate rooted in reason and justice, and not as something left at the mercy of the open market and the physical law of supply and demand. Sweating and abuses of child and female labour are condemned, and ownership, especially in land, by "as many as possible of the humbler classes" is commended and encouraged (Rerum Novarum, *De conditione opificum*, May 15 1891). To this was added a plea for shortening the hours of the labourer, especially in the mining industry, so that he might have sufficient leisure for his mental and religious development. These principles had been already set forth in more elaborate form by a Catholic society known as the Union of Fribourg, established for the study of social questions, and its annual reports and papers had been studied with interest and approval by Leo XIII.

In France the Encyclical exercised a notable influence on the direction of the leading Catholic organizations, the Jeunesse Catholique Française and the Society of Catholic Workmen founded by the Comte de Mun. It led to the formation of an important and popular organization known as the "Sillon," under the inspiration and leadership of M. Marc Sangnier. It had for its object the defence of the rights and the betterment of the condition of the labouring population based on the teaching of the Catholic Church. Circles for the study and diffusion of sound social principles were formed in all parts of France, and met with the encouragement of several of the leading bishops, notably Mgr. Mignon, Archbishop of Albi. As its following increased, its organization assumed a national or extra-diocesan importance, and large numbers of men who were not Catholics or merely nominal Catholics were attracted to its membership. In this way, from the original stage in which its members were frankly Catholics, it came to be in great measure composed of those who were content to pledge themselves as "not anti-Catholic." In this, the "Gros Sillon," the aim was to unite the workmen of all nations and all parties and all creeds in a movement of democratic progress. Its evolution of thought and teaching went to emphasize strongly not only the rights, but in many ways the autonomy of the individual, and, in the opinion of Cardinal Andrieu and several of the bishops, it had begun to verge into what seemed to be a species of modernism applied to social economy, thus committing the Church to what many deemed to be an ultra-democratic and, therefore, a party programme. In response to many and repeated complaints made in this sense to the Holy See, Pius X. in Aug. 1910 finally addressed a letter to the French episcopate (*Notre charge Apostolique*) pointing out the aspects of the later Sillonist movement which had departed from the lines laid down by Leo XIII., and requiring that the association should be brought back to its former Catholic basis, and placed under diocesan direction.

In Germany, some years before the issue of the papal Encyclical on labour in 1891, Herr Windthorst, the leader of the Centrum, had founded the great organization of German Catholics known as the *Volksverein*. It was followed in 1910 by the Congress of Christian Syndicates at Cologne which represented 360,000 workmen in Germany and 100,000 in Belgium and 100,000 in Italy. Associations for promoting the welfare of the labouring classes (*Arbeiterwohl*) and Catholic working-men's unions (*Arbeitervereine*) throughout Germany marked the growing interest and importance of the labour movement. At the same time societies were instituted on an international basis for the study of social problems, and circles were formed to encourage the reading and discussion of popular Catholic social textbooks and literature. In eastern Germany, Cardinal Kopp, Prince Bishop of Breslau, on the occasion of his jubilee, was met by a vast concourse of Catholic workmen, marshalled in their unions, to thank him for the work he had achieved for their organization. In the west Cardinal Fischer, Archbishop of Cologne, had encouraged the same movement, albeit on more general lines. The unions in the east were of distinctively Catholic membership, while in the west Catholic workmen were often included in unions of a non-denominational kind. This difference of policy led to a considerable amount of discussion, and comparisons between what was known as the "Cologne influence" and the "Breslau influence" were much in circulation amongst German Catholics. On the one hand it was thought that the membership of Catholics would exercise a moderating influence on non-denominational associations. On the other it was felt that the strength and zeal of the Catholic unions would be best consulted by keeping them upon their own lines. In 1912 this matter was laid before the Holy See, and Pius X. addressed a brief (*Singulari quadam*) to Cardinal Kopp and the bishops of Germany in which he speaks in terms of the highest praise of the workmen's unions, and then, dealing with the point in dispute, lays it down that the Catholic unions are to be encouraged, as fostering the spirit and development of the members in harmony with their religious convictions (as at Breslau). At the same time the association of Catholics in non-denominational unions (as at Cologne) is not to be condemned, provided that due precautions are taken to safeguard their teaching by their enrolment as well in the Catholic societies.

The Church and Canon Law.—Pius X., a few months after his accession to the papacy, took in hand the codification of the Canon Law, a work of monumental importance to the Church, but one so difficult that many had deemed it to be impossible.

The ordinary sources of Canon Law are the canons of Church councils and the decrees of the popes, and during the ages these had accumulated to such an extent that their assortment became a task which would require many minds and many years to accomplish (*see* 5.192). In 1151 Gratian, the monk of Bologna, had gathered together in his *Decretum* (which was not official) many of the ordinances of the Church, doing for her law something of the same service that Peter Lombard had done for her theology. Other collections of canons followed by Balbo, Gilbert, Allain, Bernard the Great, Innocent III. and Honorius III., and these materials served as the base of the great work of Gregory IX. in 1234, known as the five books of Decretals. To it were added the Decretals of Boniface VIII. (the *Sextus*) and of Clement V. (*Clementines*) and of John XXII. (the *Extravagantes*), and these, with later enactments, formed the *Corpus Juris*, which throughout the Middle Ages and to our own time has been the standard groundwork of the voluminous treatises and textbooks of Canon Law in the Catholic Church.

The Council of Trent in the 16th century, and the Council of the Vatican in the 19th, had urged the need of bringing codification of the Canon Law up to date, and several collections had been attempted by individual authors like Mgr. Martinucci and M. Wolf von Glanwell, but all of these had fallen short of what was required. On March 19 1904 Pius X. issued a *Motu Proprio* authorizing the inception of this difficult undertaking—"*arduum sane munus*"—and entrusting it to a commission of which the president was to be the Pope himself. The commission consisted of 16 cardinals, with 17 consultors.

Before the completion of the work the consultors numbered nearly 80, and were chosen as distinguished canonists or theologians from the various nations. A few days after the publication of the *Motu Proprio*, Cardinal Merry del Val, the Secretary of State, addressed a letter to the Catholic bishops in all parts of the world, explaining the nature of the enterprise, asking their coöperation by suggesting new points of reform or legislation, and requesting them to consult those in their dioceses who might have expert knowledge of the subject, or even to send them to Rome to help in the project. As a result voluminous communications were received from all parts of the Church, in the shape of suggestions or practical recommendations. These were duly sifted, arranged and discussed, and as far as possible adopted, and proofs and revises were transmitted to their proponents. In this way, at the cost of much labour and time, the whole episcopate throughout the world was consulted no less than three times over as to the matter and form of the forthcoming volume.

Its main characteristic was that, unlike the *Corpus Juris*, it would be not a series of collections of canons under various pontificates and

preconized in Papal Consistory, and render to it an account of their stewardship, in the same way as the bishops of Italy, France, Austria, Spain or other parts of the world where the bulk of the population is Catholic.

This historic measure is based on the recognition of the progress of the Church in the countries mentioned. It is reckoned that there are now some 12,000,000 of Catholics in the British Empire. There are 17,000,000 in the United States and 5,000,000 in the Philippines, making 22,000,000 under the Stars and Stripes and, in round numbers, about 34,000,000 of the English-speaking world. This total forms more than a ninth part of the whole Catholic Church.

Restoration of the Rota.—Another important feature of the same constitution completed by the brief has been the restoration of the well-known Court of the Rota. All who have engaged in the study of mediaeval history are familiar with this famous tribunal which was for centuries the supreme court of ecclesiastical appeal for the universal Church. It was this court that in final instance adjudged those cases of appeal to Rome which are found in such numbers in the records of every Catholic country, especially during the Middle and later Middle Ages. Such cases cast a vivid light on the state and working of the mediaeval Church, and students of Church history of the school of Maitland, Othenthal or Dr. Sägmüller have found how necessary for a true understanding of them is the knowledge of the methods and procedure of the Rota and the Chancery.

The Rota consisted of a dean and 12 judges, or auditors (usually chosen from the various nationalities), with a large attendant body of advocates and notaries. Each case was heard by a panel or "turn" of three judges. If a litigant was dissatisfied with the decision he could have the case tried anew, or even a third time by a fresh "turn" of three other judges, one of whom could be chosen by himself, and the other two by the judge thus selected. When two or three of the judgments thus given were concordant, the case was definitely settled. (Hence the clause: "After a third definitive sentence," so often found in the records of appeals in the pre-Reformation centuries.) In the later Middle Ages the volume of judicial business in the Rota was very considerable, but in later times it was notably reduced, as the Holy See had extended and encouraged the system of having cases tried "extra-judicially" by judges delegate, acting by papal authority, but chosen by the litigants themselves, and adjudicating in their own country, as may be seen in numberless entries in the volumes of the *Calendar of Papal Letters* relating to Great Britain.

Pius X. restored the Rota to its ancient preëminence as the chief court of the Catholic Church. It has now a dean, and 10 instead of 12 judges, but its procedure by "turns" or successive sentences on appeal remains substantially unaltered. It is in this tribunal that appeals on matrimonial cases are heard from all parts of the Catholic world, and amongst them such *causes célèbres* as that of Parkhurst and Reid, and Miss Anna Gould and the Marquis Boni de Castellane, who, after strenuous efforts, have failed to obtain a verdict of nullity upon their marriages. A further appeal from the Rota now lies to the commission of judges in the *Apostolica Segnatura*, insomuch as the latter acts as a court of cassation, and takes cognizance of defects of procedure.

As the Catholic Church condemns the doctrine of divorce, in the sense that any marriage between Christians that has been validly contracted and consummated can be dissolved by anything but the death of one of the parties, the matrimonial cases justiciable in the Rota or the Segnatura are only those in which a plea is brought against validity of the marriage, and is put forward to prove that, for reasons good in Divine or Church law, the bond of matrimony never existed. A modern feature of the restored Rota is that condensed reports of the leading trials are published in the official *Acta Apostolicae Sedis*, with a summary of the facts (*Compendium Facti*) and of the juridical principles involved (*Compendium Juris*).

Reconstruction in England and Wales.—The same policy of reconstruction was applied to the Catholic Church in England. At the restoration of the hierarchy in 1850 the whole of England was included in a single province, having its archiepiscopal see at Westminster. On Oct. 28 1911 Pius X., after consultation with the English bishops, issued a constitution (*Si qua est*), in which, after reciting the distribution of sees made by his predecessors Gregory I. and Pius IX., he divided the Catholic Church in England and Wales into three provinces, with archiepiscopal sees at Westminster, Birmingham and Liverpool. Westminster retained as suffragan sees the dioceses of Northampton, Nottingham, Portsmouth and Southwark. To Birmingham were assigned Clifton, Plymouth and Shrewsbury and the two dioceses of Menevia and Newport which included Wales. To Liverpool were given the sees of Hexham, Leeds, Middlesborough and Salford. The Archbishop of Westminster and his successors were declared to be perpetual presidents of the episcopate, with the right to wear their pallium, and to be preceded by their cross in any part of England and Wales, to preside at all meetings of the bishops, and to represent them in any dealings with the civil Government of the country, having first consulted their suffragans and accepted the decision of the majority. A further development of this plan was effected five years later, when Benedict XV., by a Bull of Feb. 7 1916 (*Cambria*), erected Wales into a new and separate province, transferred the see of Newport to Cardiff, and raised it to an archbishopric, with Menevia as its suffragan.

The motive underlying this change is best expressed in the opening clause of the Bull:—"Wales, by the Celtic origin of its people, its language, customs and traditions, is so different from the rest of England that it needs, even in its ecclesiastical order, to be taken apart from the other dioceses and to be given its own hierarchy." It has been pointed out that these words are the recognition and fulfilment of a claim which was made by the canons of St. David's in the year 1145, when they petitioned Pope Eugenius III. to make Wales a distinct ecclesiastical province and to grant the pallium to its archbishop.

The Church and Doctrine.—The action of the Church in matters of doctrine included chiefly the continuance of her conflict with "modernism," which had been condemned by Pius X. in his Encyclical (*Pascendi*) of Sept. 7 1907. This was followed up and reinforced by a *Motu Proprio*, addressed to the whole Church (*Sacrorum Antistitum*) on Sept. 1 1910.

The Encyclical contained an elaborate exposition of the views put forward by the chief modernist writers, who for several years previously had carried on an active propaganda, mainly amongst the priests and seminarists in France and Italy and, to a smaller extent, in England and America. The ostensible object of the movement was to win recognition for a restatement of religion and the Catholic faith in such a form that it might be made acceptable to men holding the most advanced opinions outside the Catholic Church. The attention of the Pope was drawn to their utterances by several councils of bishops, and, after a full examination of their literature, the Holy See arrived at the conclusion that, in pursuing their end, they had essentially altered the meaning of the Catholic doctrines which they professed to explain. Such concepts as "religion," "faith," "revelation," "dogma," "sacraments," "authority," "the Person of Christ," were set forth in a sense alien and contrary to that which is taught by the Catholic Church. Pius X. vigorously condemned the whole system as "a summary of all the heresies" and ordered rigorous measures to be taken to secure its elimination from the fold.

The *Motu Proprio* of 1910 emphasized the decision of the Encyclical, and prescribed further steps for the exclusion of all modernist doctrines, requiring that holders of ecclesiastical offices or dignities should take an oath and make a specific profession of faith for this purpose.

In the course of the years that followed, the "modernist" movement, in view of this condemnation, practically ceased to trouble the peace of the Church. Of its three chief leaders, Father Tyrrell in England, the Abbé Loisy in France, and the Abbate Murri, who was the exponent of its political and social activities in Italy, the first died in 1909, and was buried outside the Church; the second, who had already abandoned his belief in the Godhead of Christ, was excommunicated; the third laid aside his priesthood and shared the same fate. Some friends of the movement had entertained the hope that, on the death of Pius X. and the accession of a new pope, the reprobation of their views might in some degree be modified and "the storm pass over," but one of the first acts of Benedict XV., in his Encyclical *ad Beatissimi*, addressed to the episcopate of the whole Catholic world, was to renew the condemnation of "modernism," denouncing its "monstrous errors" as a "collection of all the heresies," describing the movement in the words of Job (xxxi. 12) as "a fire that devoureth even to destruction and rooteth up all things that spring," and warning the faithful not only against its teaching but against its spirit. The effect has been to indicate that if modernism has a future it must be one that will be outside the Catholic Church.

The Church and the Social Question.—In relation to socialism and the economic questions which arise out of the contending claims of capital and labour, the main lines of direction to Catholic thought and action had been laid down in the Encyc-

the rulers of nations to adjust their quarrels "by reason and by conscience and by generous goodwill." On July 28 of the same year he made a similar appeal to the statesmen of the combatant nations. This method of public exhortation was the only means left to the Holy See to advocate peace, as a secret treaty (London, April 26 1915) had been signed by Great Britain, France, Russia and Italy, by which these Powers consented to the request of Italy that no representative of the Holy See should be allowed to take diplomatic action towards the conclusion of peace, or the settlement of questions arising from the war (Art. 26).

In the consistory of Dec. 4 1915, and again on Dec. 24, Pope Benedict renewed his condemnation of the spirit of hatred engendered by the war and his protest against the cruel persecution of the Armenian people. He regretted that his appeal for peace to the belligerents, although received with all reverence, had failed to secure its object. On Feb. 9 1916 the Pope received an address representing three millions of Jews in the United States, and expressed his sincere desire that in all matters they should be treated with fairness and equity. In the consistory of Dec. 4 1916 the Pope spoke of the iniquities and cruelties of the war by sea and by land, by deportations of civilians, and air raids on open towns, and said: "We brand once more with our reprobation all the atrocities committed in this war, wheresoever they have taken place, and by whomsoever they have been perpetrated." In response to a petition from the cardinals, Benedict XV. once more appealed to the rulers and peoples of the combatant countries to foster the spirit of goodwill, by which alone peace could be restored.

In Aug. 1917, at a time when the struggle appeared to many to have reached a hopeless *impasse*, he went further and addressed a diplomatic note to the belligerents, suggesting the outlines on which at least preliminary conditions of peace might be considered. These were that there should be reciprocal condonation as to the costs of war; that Germany should evacuate Belgium and guarantee its complete independence in the future, and also evacuate all French territory and possibly receive in return her lost colonies; that all disputed territory between Germany and France (Alsace and Lorraine) and between Austria and Italy (the Trentino and Trieste) should be arranged by mutual consideration and conciliation. The argument of the note was that, whatever loss either side might suffer by such an arrangement, it would be immeasurably less than that involved in the sacrifice of life and treasure by the continuance of the war. Respectful replies were made to this note by Belgium, the United States, Japan, Germany, Austria and Turkey in writing. England answered orally by her envoy at the Vatican; and France, who had no representative there, is said to have tacitly or privately adhered to the British response. All appreciated the good intentions of the Pope as a peacemaker, but the hour for overtures had not yet come. One result of the note was that the British Government desired to be informed more definitely as to the intentions of Germany in regard to Belgium. The papal nuncio at Munich thereupon asked the German Chancellor Michaelis, and obtained precise information on the point, and Cardinal Gasparri transmitted to the British authorities the replies of the German and Austrian Governments, and offered, in case that the answer given should seem to furnish to the Entente Powers a basis of mediation, to obtain any fuller information that they might desire. The Allies apparently found that no sufficient basis existed, and the matter proceeded no further, but at the end of 1917, and previous to the great offensive of the German army, the Pope once more addressed to the Central Powers a strong entreaty to desist from methods of warfare which are contrary to international law. On May 22 1918 he wrote to Cardinal Ferrari of Milan a letter explaining and justifying the attitude of the Holy See during the war, and replying to the manifold ways in which it had been misjudged or misrepresented.

The action of the Pope in regard to those who suffered by the war was first of all directed to making provision for the spiritual welfare of the armies engaged. In concert with the episcopate of the belligerent nations and the military authorities, the Holy See caused to be organized the body of chaplains who were to accompany the troops, and invested them with the fullest powers for the discharge of their ministry. In most cases an *episcopus castrensis*, or field bishop, was appointed to preside over the chaplains of each country. Societies were formed for the equipment of the chaplains, and more than 10,000 portable altars with consecrated altar-stones for the celebration of Mass were placed at their disposal. Prayers and Masses for the fallen were offered throughout Catholic Christendom.

As early as Dec. 1914 the Pope established in the Vatican an information office with a view to enable the relatives of prisoners-of-war to ascertain their address. In Oct. of the same year the Pope wrote to Cardinal Hartmann of Cologne to urge him to use all his influence to secure better treatment for the prisoners in Germany. He wrote also to the bishops of places where prisoners were interned to see that priests speaking their language should visit them, encourage them to write to their families, and if need be defray the postage. In Sept. 1915 the Pope obtained from Germany the suppression of the camp for air-raid reprisals at Neuenkirchen. At the same time he obtained an assurance from all the Powers that prisoners-of-war should not be forced to work on Sundays. He sent in 1917 a special delegate to visit the prisoners in Germany, charged to see, if possible, the prisoners alone, and to report to the Holy See on their treatment. At Easter 1916 the Pope sent presents to be distributed to the English prisoners in Turkey. In May 1916 he obtained the transfer of a number of English prisoners from Germany to the hospitals of Switzerland, and received the cordial thanks of the British Government and a letter of thanks from the prisoners themselves. He procured in 1918 the liberation of Dr. Beland, former Canadian minister, who had been for four years a prisoner in Germany. He also charged his nuncio at Vienna to find homes in the country for the children suffering from want of food.

In 1916 a commission of Austrian priests made inquiries into the atrocities perpetrated in Belgium and drew up a report damaging to the Germans. The Archbishop of Vienna courageously read the report publicly from the pulpit, whereupon the Austrian Government, at the instigation of its ally, wrote to the Pope asking that the archbishop should be made to resign. The Pope categorically refused. He received in the following year a letter of thanks from King Albert for the help and sympathy given to Belgium throughout the war. The Holy See had sent 100,000 francs for the starving children in Vienna, and 50,000 francs for the children and prisoners in Belgium, and a larger sum to be distributed to the sufferers in the devastated regions in France. At the same time, he received the thanks of the Belgian Government for obtaining the reprieve of more than 50 persons who had been condemned to death by the Germans. He was able at the same time to procure from the German headquarters the liberation of a large number of French prisoners and the repatriation of civilians from the northern districts of France. His intervention was equally successful in obtaining from the Austrian Government the release of a considerable body of Italian prisoners-of-war.

Immediately after the conclusion of the Armistice the Holy See communicated with the several Powers and urged the speedy liberation of the prisoners that remained in their hands. In Aug. 1918 the Pope, in response to a petition from 200,000 war widows in France, celebrated Mass for their husbands, in the presence of a large pilgrimage from their number sent to Rome for the occasion. The fund which Benedict XV. organized throughout the Church in behalf of the starving children in the countries ruined by the war had early in 1921 reached the sum of more than 11,000,000 lire (then about £160,000).

Amongst the chief authorities on which the above article is based are the official reports of the Holy See, the *Acta Apostolicae Sedis*, the *Annuaire Pontifical* of Mgr. Battandier, and the volumes of the *Documentation Catholique*. (J. Mo.*)

III. The Free Churches

Doctrinal.—The disquietude caused among the Free Churches in Great Britain by the "New Theology" movement (1907) had no long life or lasting effect. At the Congregational Union meeting in Nottingham in Oct. 1911, Principal Forsyth and Rev. R. J. Campbell, who had figured most prominently in the controversy, appeared on the same platform. In 1916 Mr. Campbell was ordained into the ministry of the Anglican Church, and withdrew his book from publication. The attacks on the historicity of Jesus, put forward by A. Drews in Germany and J. M. Robertson in England, were met with thoroughness and skill, especially by Dr. Estlin Carpenter, of Manchester College, Oxford. The question of miracles, brought into prominence by the Rev. J. M. Thompson, of Magdalen College, Oxford, led

to some discussions, but neither it nor Dr. Schäfer's utterances on the origin of life (British Association, Dundee 1912) stirred the waters to any extent. The general position of biblical scholarship is well illustrated by *Peake's Commentary on the Bible*, to which not only Free Churchmen but several Anglicans contributed. Dr. Buchanan Gray has (continuing the work of Dr. Driver) provided a monumental commentary on *Job*. Perhaps the outstanding work on theology is Dr. R. S. Franks' *History of the Doctrine of the Work of Christ* (1918). Popular clamour during the war against German theological works had no echo among scholars. The younger men were becoming busily concerned with the application of the Gospel to the conditions of the post-war world; their activity is illustrated in *The Christian Revolution* series and the publications of the Student Christian Movement. Two books by Dr. T. R. Glover, of Cambridge, *The Jesus of History* and *Jesus in the Experience of Men*, have had a wide circulation.

There is no disposition among those churches that dispense with formal creeds to introduce anything of the kind, and where confessions are already in existence the tendency is to modify and adjust them, or to regard them as declaratory rather than binding. Thus the English Presbyterian Church has revised the statement of Church principles made at the ordination of ministers, and the form of the questions put to the candidate, the aim being to lay more emphasis on the minister's message and less on his theory. Similar steps were being taken in 1921 by the U.F. Church in Scotland. On the other hand, proposed unions of Methodists, Presbyterians and Congregationalists in the dominions involve the last-named denomination in a confession or creed, or at least a statement of faith which in most cases would be accepted for the sake of union. The war gave rise to some discussion on prayers for the dead, and it may be said generally that the old rigidity has given way here to a more open-minded spirit. It is sufficient merely to mention other discussions raised by the war—providence, patriotism, conscience, reprisals, eschatology—which found expression in books and still more in pamphlets.

Union and Federation.—Looking for a moment to the overseas dominions, which in so many ways have developed their impact on the home land, far-reaching movements had come by 1921 into operation. The Baptists, indeed, stoutly maintained their distinctive witness, and were disinclined toward schemes of amalgamation. But both in Australia and Canada Presbyterians, Methodists and Congregationalists were steadily approximating. The first-named Church, not so unanimous as the others, did not give a sufficiently decisive vote in Australia in the autumn of 1920, but negotiations, accompanied by a large measure of coöperation, still continued. In Canada also the Presbyterians had been the most cautious, but in June 1921, by a majority of about 400 to 100, they agreed to union with the other two bodies. In New Zealand Congregationalists were being absorbed into the Presbyterian Church. In the mission fields, especially in South India and to some extent in China, the movement was much more successful, and included Episcopalians. In East Africa the Kikuyu controversy (in which the Bishop of Zanzibar dissociated himself from his brethren of Mombasa and Uganda for their fellowship with non-Episcopal missionaries in an attempt at union in face of Moslem aggression) created some unpleasantness, but a *modus operandi* was found. In Great Britain, apart from Scotland, it cannot be said that any new organic union was in 1921 actually in sight. For some years past the three next Methodist connexions (Wesleyan, Primitive and United) had been exploring avenues to union. Among the difficulties were the proportion of lay to clerical representation in Conference, and the relative priority of representative and pastoral sessions. Some Wesleyan leaders felt that the contemplated union might prejudice the case for the larger union. It seemed possible that Primitives and Methodists might come together apart from Wesleyans, but probable that patient continuance would secure the triple bond.

Meanwhile the overlapping of Free Churches in smaller towns and villages made for weakness, and caused concern to the leaders of the different denominations; and it was with the design of securing closer coöperation that Rev. J. H. Shakespeare, when president of the National Free Church Council at Bradford, 1916, propounded a scheme for federating the Evangelical Free Churches of England, which was afterwards accomplished. The federation differed from the National F.C. Council in that its executive members were appointed by the conferences or assemblies of the different communions, and its aims and objects were specifically moral and spiritual. Alongside this there was increasing coöperation in the mission field, in social service and in the training of ministers, especially in the theological faculties at London and Manchester. One of the most impressive demonstrations of the Free Church unity was the thanksgiving service after the Armistice, in the Albert Hall, London, at which the King and Queen were present.

Relations with the Anglican Church.—In spite of some tension caused by the question of Welsh disestablishment and the commemoration in 1912 of the ejectment of 1662, there was between 1910 and 1920 a decided growth of sympathetic and amicable feeling between the Anglican and the Free Churches and no small amount of coöperation. British Nonconformists still believed that they were entitled to more real recognition at State festivals, and valued the fellowship exemplified at the installation of the Prince of Wales at Carnarvon in July 1911. In the academic world, churchmen of all denominations worked together in harmony and full trust on the theological boards of the newer universities; and the removal of the restrictions on divinity degrees at Oxford, Cambridge and Durham was warmly appreciated. The placing of a Bunyan memorial window in Westminster Abbey, and its joint dedication by the Dean and representatives of the Free Churches, was a happy sign of the time. During the war, chaplains of both sides learned to appreciate each other and worked happily together, and the same stress did much to bridge the chasms at home. United services of intercession and thanksgiving were frequent, and created a new sense of fellowship. The action of the Bishop of Hereford (Percival) in inviting Nonconformists to a coronation communion service in the cathedral in 1911 was in advance of common Anglican sentiment, but the fact that Dr. Jowett preached in Durham cathedral in 1920 (at the invitation of the bishop, Dr. Moule), and Bishop Welldon, Dean of Durham, in Westminster chapel in 1921 was significant. The Lambeth proposals indeed rather deprecated any such pulpit exchanges, though it might seem, as Dr. Wallace Williamson intimated to the Archbishop of Canterbury at the Church of Scotland Assembly in May 1921, in the light of Scottish experience, that they pave the way to union more surely than theoretical discussions.

The Lambeth proposals were discussed in nearly all the "supreme courts" of the Free Churches and by the Federation of Free Churches, and received sympathetic and friendly consideration. Free Churchmen were not slow to indicate certain ambiguities of utterance in the proposals and to assert the impossibility of accepting reordination. But in 1921 they were coming to see that the Lambeth proposals were not an ultimatum so much as an appeal to "come and reason together." It was possible that along the line of this idea of "extended commission" the difficult question of reordination might be avoided. It was great gain that the proposals did not contemplate the absorption of non Episcopal communions in the Episcopal fold, but the Anglican leaders had hardly yet made that detailed study of the history and principles and genius of nonconforming Churches that seemed essential to any realization of their suggestions. Many Nonconformists would require a readjustment of the relations of the Anglican Church to the State, and many more looked askance at any proposal involving relationship with the Roman or Greek Churches. Meanwhile there were abundant opportunities for united service which did not entail the least abandonment of conviction and principle on either side. In the mission field, in theological study and in social service, there was already manifest in 1921 a degree of coöperation and fellowship which was full of promise for the consummation of a unity that need not be confounded with uniformity.

The World Conference on Faith and Order, propounded by American Episcopalians, and temporarily frustrated by the war, was sympathetically considered by Free Churchmen. A preliminary meeting held at Geneva in Aug. 1920 attracted 120 delegates from 40 countries. A continuation committee of 55 members was appointed.

Modifications of the Independent Position.—In the Baptist and Congregationalist denominations the decade 1910-20 was perhaps the most important in their history. Great movements in thought and action transformed both the polity and the position of these communions. The movement in thought may be summed up by saying that they had come gradually to realize that Independency, pure and simple, as it was understood and practised in earlier days, was no longer sufficient to meet the conditions of modern religious life. And the main movement of polity was in line with that of the world as a whole in substituting the ideal of interdependence for that of independence.

This movement of thought found expression in two or three main directions. In the first place it was generally recognized by 1921 that the training, the appointment and the proper support of the minister was not the concern of the individual church only but of the whole denomination. This recognition led to the raising of sustentation funds of £250,000 in each case. The object of the funds was primarily to secure to every accredited minister a minimum stipend adequate for his support, but inevitably the scheme could not stop there. If the denomination accepted responsibility for the support of the minister, it followed logically that it must have some voice in his training and appointment. Not much had yet been done up to 1921 towards a reform of the college system, though a beginning was made by the creation of a united collegiate board in each denomination and further advance was inevitable in this direction. But in the matter of ministerial appointments the scheme introduced radical changes into the old Independency. It combined provision both for sustentation and settlement. Churches were still left free to call anyone they chose as their ministers, but grants from the sustentation fund were conditional on their choice being approved by the executive committee of the fund.

Another important provision of the Baptist scheme was that all appointments to the pastorate of aided churches should be for a definite term of five years, and then should automatically cease unless renewed by the express invitation of the church, with the consent of the executive committee.

With the introduction of these changes it speedily became clear that the responsibility of the denomination for the ministry could not end even here. If all pastorates were to end automatically after five years, there must be some central organization, like the synods of the Connexional Churches, to secure other pastorates for the ministers thus out of charge, and to maintain them during the time they were out of office. Accordingly the system of general superintendents was introduced. The country was divided into 10 areas, with a general superintendent in charge of each, whose duty it was to visit the churches, to advise them in their perplexities, and, in concert with the other superintendents and the executive committee, to arrange for the resettlement of ministers at the expiration of the term of their pastorates. This part of the scheme, which introduced the most important change into the older Independency, was an unqualified success. While still leaving the churches full liberty in the management of their own affairs, it completely solved the problem of ministerial settlements which was one of the most serious questions in earlier days.

The Congregationalists had in 1921 not yet gone so far as the Baptists, who in their general secretary, Dr. J. H. Shakespeare, had an ecclesiastical statesman of rare gifts. They did not subject the aided pastorates to a five years' term, but they divided the country into nine similar provinces with a moderator in charge of each, whose functions and duties practically coincide with those of the Baptist superintendents. This scheme was only launched in Nov. 1919, but had already justified itself by 1921.

The World War.—The Free Churches of Great Britain bore their full share in service during the World War. In earlier days Presbyterians (through the Church of Scotland) and Wesleyans alone had any army chaplains or army work. But when the men of the Free Churches entered the British forces by myriads, provision had to be made to meet their spiritual needs. Under the leadership of Dr. Shakespeare a United Navy and Army Board was formed by the Baptists, Congregationalists, Primitive Methodists and United Methodists, to appoint chaplains to the members of these four denominations. No fewer than 320 chaplains served with the forces in the home camps and all theatres of war, many of whom were awarded high distinctions. After demobilization the board remained, and was in 1921 represented by five permanent chaplains.

With the great increase in the cost of living the lower stipends of ministers in all denominations became quite inadequate. Local effort was often unequal to the task of rectifying this, and denominational machinery had to come to the rescue. The fall in foreign exchanges due to the high price of silver in 1919-20 put a heavy burden on the missionary societies and led to much hardship in the foreign fields. Generally speaking the situation was met with courage and zeal. The Baptists, *e.g.* in six months in 1920 raised a new fund of £270,000, of which half was for the relief of the missionary society and half for increasing the minimum stipends of the home ministry. The Congregationalists were in 1921 promoting a fund of £500,000 for similar purposes, and especially for a superannuation scheme. Methodists and Presbyterians were similarly diligent. With the fall in the price of silver the foreign aspect was improved.

The war brought other difficulties. The revelations made in the survey published under the title of *The Army and Religion*, as to the relative ignorance in spiritual matters of men of all denominations, caused much heart-searching. In church circles, as in other departments of the nation's life, there were disappointment and disillusion. Neither war nor peace had brought the millennium. The churches were not filled. The theological colleges, depleted and generally closed during the years of war, were by no means filled again afterwards. For some years there had been no adequate output of ministers, and the outlook was not bright in 1921.

The Society of Friends, with its particular peace testimony, met the situation of war in its own way. While many of its young men suffered as conscientious objectors, others embraced dangerous non-combatant service such as mine-sweeping; many more were engaged in Red Cross work, and the Society as a whole did invaluable work in repairing waste places, assisting in the restoration of villages and lands, and in combating disease and famine in Allied and (since the war) in enemy countries alike.

One curious effect of the war was that Nonconformists became much more familiar with liturgical forms of service. The many united services of intercession and thanksgiving were responsible for this, and it was significant to note the number of new manuals issued, containing systems of common prayer and praise. Presbyterians, Congregationalists and Methodists alike were drawn into this movement. The elasticity of the Free Churches was well illustrated by the ministry of Dr. Orchard at the King's Weigh House chapel, London, where a full-blown liturgy was in use long before 1921 and a high sacramentarian practice followed. Dr. Orchard was also the leader in what is known as the Free Catholic movement.

Other Denominational Activities.—Two great ecumenical conferences were held in 1911, both in America. The Baptists met at Philadelphia; one of the most striking features of the gathering was the presence of a group of ministers from Russia and S.E. Europe, where the Baptist cause was making phenomenal headway. The war played havoc with this progress, but afterwards there were indications once more of reconstruction and growth. The same may be said of the Presbyterians of Hungary and Transylvania, who suffered additionally by the unsympathetic action of Rumanian officials. Methodists of all shades met at Toronto in 1911. The war prevented these international gatherings for some years, but Congregationalists held their Fourth International Council at Boston in 1920, and Presbyterians met in Pittsburg in Sept. 1921. Another noteworthy

Methodist event was the opening of the new Wesleyan Church House in Westminster (Oct. 1912), as the headquarters and focus of the multiple organization of the Connexion. It is an outcome of the million-guinea fund raised at the beginning of the century and is a monument of the unwearying care and ability of Sir Robert Perks. The Wesleyans in 1921 also established a theological college at Cambridge.

In 1912 the Congregationalists, and to a less extent the Baptists, Presbyterians and Unitarians, celebrated the 250th anniversary of the Act of Uniformity and the consequent ejection of 2,000 ministers (1662). Here and there the occasion was used somewhat aggressively against the Anglican Church, but on the whole attention was drawn to the positive lessons of the ejectment, fidelity to conscience, and the dawn of the modern idea of a free Church in a free State. In 1920 the tercentenary of the Pilgrim Fathers was widely celebrated in England, Holland and America.

In this connexion may be mentioned a notable crop of sound historical research in which most of the Free Churches have taken part, and which contrasts favourably with the comparatively uninformed productions of past generations. For Elizabethan Puritanism and Separatism we have the work of Mr. Champlin Burrage and Dr. Albert Peel, while Rev. W. Pierce has done much to clear up the Marprelate mystery, Rev. Ives Cater that attaching to Robert Browne, and Rev. W. H. Burgess has investigated anew the story of John Smith, "the Se-Baptist," and of John Robinson. As regards the 17th century, the Rev. B. Nightingale has pointed the way to a very necessary revision of Calamy's story of the ejected ministers, and brought to light many facts respecting Cumberland and Westmorland, and Prof. Lyon Turner has made a special study of the indulgences granted in 1672. Prof. Alex. Gordon is another diligent worker in this field. Mr. W. C. Braithwaite has written a standard history of early Quakerism in England, and Dr. Rufus Jones has performed a similar service for America. Rev. H. W. Clark has produced a comprehensive history of Nonconformity in two volumes. Dr. Rendel Harris has been indefatigable in his researches into the history of the "Mayflower," that carried the Pilgrims to New England, and has brought to light very interesting information. It is even suggested that part of the ship itself is preserved in the timbers of a barn at Jordans, in Buckinghamshire.

Statistics.—The Free Churches in the United Kingdom had to admit a falling-off in their figures during 1910-20. For several years prior to the war most of them, especially Baptists and Wesleyans, had to lament an annual decline in numerical strength. The Welsh revival of 1904-5 brought into the churches an immense number of recruits whose stability proved to be in inverse ratio to their enthusiasm, and many quickly fell away. This accounted for much of the decrease; emigration and the movement from the rural to the urban districts were other causes. People change their residence more often than of yore, and are not always careful to transfer their membership. The increase of Sunday pleasure and the general "spirit of the age" have also to be taken into account. The incidence of the war made the compilation of statistics very difficult, and even in 1921 the machinery was not in proper working order. There were indications, however, that pointed towards a cessation of the decrease and in some quarters towards an increase. The figures given in the following schedule are but an approximation. The meaning of the term "members" varies to some extent in the different denominations, and some of the returns are a year or two old.

	Ministers	Members	Sunday Scholars
Wesleyan Methodists	2,768	489,870	849,861
Congregationalists	2,883	451,229	605,796
Baptists	2,061	380,357	481,128
Primitive Methodists	1,095	206,372	424,452
United Methodists	709	138,921	264,113
Calvinistic Methodists or Welsh Presbyterians	961	187,575	191,295
Presbyterians (Eng.)	390	84,232	67,139
Society of Friends	..	18,753	17,222
Independent Methodists	381	8,468	25,192
Unitarians	338	..	28,330
Churches of Christ	..	13,310	15,702
Countess of Huntingdon's Connexion	34	1,933	2,736
Moravians	39	5,539	4,162
Wesleyan Reform Union	16	8,506	21,978

The Salvation Army returns 9,635 corps, circles and societies; 17,288 officers and cadets; but gives no returns as to adherents. In Ireland the (disestablished) Episcopal Church claims about 600,000 of the population, the Presbyterians 450,000, the Methodists 65,000. Congregationalists and Baptists are very thinly represented.

Allied Organizations.—The *Brotherhood* movement, in some places known as the P.S.A., was particularly hard hit by the war, and was still finding reconstruction difficult in 1921. But a great opportunity was there for these services, brief and bright, where addresses are given on Bible subjects or on themes of current interest from the Christian point of view, much stress being laid on the obligations of Christian citizenship. The movement has spread to the continent of Europe, and had much success in Canada. The *Adult Schools*, a much older institution, and one in which Friends have been particularly active, have been hampered by the lack of suitable local leaders and class teachers, but exercise a very potent influence through the men who meet usually on Sunday mornings about nine o'clock. *Sunday Schools* have suffered in the number of scholars, but the quality of the work done is rapidly improving, as better methods of grading and instruction are introduced.

The Y.M.C.A. found its great opportunity in the war. By its operations at first in the home camps and then by invitation in N. France, and subsequently in every field of war, near and far, it led the way in ameliorating the lot of the soldier. It gained the good-will of men in the field and their relatives at home, of Government and of employers of labour. Its after-war programme, somewhat ambitious, like that of many another concern, was checked by trade depression and financial stringency, but its Red Triangle Clubs did good work.

The Student Christian Movement is one of the most vital Christian agencies in existence, and affords a happy meeting ground for the educated youth of all the churches. It has widened its earlier scope, when it was chiefly concerned with foreign missionary aims, and is now placing alongside those the claims of social service at home. It is increasingly powerful in other countries, and held an important international gathering at Glasgow in Jan. 1921.

The British and Foreign Bible Society and the *Religious Tract Society* are the willing handmaids of all the churches. They too did excellent work during the stress of war, and continued it afterwards, though hampered by the high cost of production. In March 1911 the 300th anniversary of the issue of the English Authorized Version was worthily commemorated. With regard to Bible revision, a number of Free Church scholars issued a manifesto in Oct. 1912 stating that, in their opinion, the time was not ripe in view of the work yet to be done in getting an approximately true text of the original Hebrew and in utilizing recent linguistic discoveries affecting New Testament Greek. A number of them also joined with representative Anglican scholars in a public protest against the issuing of the revised Bible of 1881-5 without the reviser's marginal readings. A new translation of the New Testament by Prof. J. Moffatt, of the United Free Church College, Glasgow, has gained high appreciation and wide use. (A. J. G.)

IV. The Presbyterian Churches of Scotland

In Scotland, apart from the relation of the World War to religion and the churches, the most prominent question between 1910 and 1921 was a possible union between the Church of Scotland and the United Free Church. These two communions embraced nine-tenths of the church members in the Northern kingdom, and thoughtful men on both sides had long been anxious for closer fellowship in the face of decreasing rural populations and the increasingly serious problems of the cities and large towns. Holding the same standard of faith and order these two great wings of Presbyterianism had practically everything in common except the State connexion. Patronage in connexion with ministerial appointments which led to the disruption in 1843 ceased to operate in the Established Church a generation ago and thus a great stumbling-block was removed. The Union of the Free Church and the United Presbyterian Church in 1900 was a predisposing cause to the thought of a larger union, and in 1910 the two Assemblies (Established and United Free) appointed committees to confer on the causes which keep the two Churches apart. These causes were not primarily connected with doctrine, discipline or worship, but with the spiritual independence of the Church, its freedom from parliamentary interference with doctrine, discipline and worship. The United Free Church felt that, in spite of the absence of any conflict between Church and State in Scotland for 70 years, the decisions reached by Lord Brougham's judgments in the Disruption cases held the field, and witnessed to the State's claim to be omnipotent in the spiritual as in the secular domain. In 1912, in a document known as the Memorandum, the Church of Scotland committee gave a new turn to the matter by suggesting: (1) that instead of the State

conceding spiritual liberty to the Church and prescribing its limits, it was for the Church to formulate and assert its own liberty and prescribe the limits within which it claimed freedom from external interference; (2) that instead of disputing over the terms establishment and disestablishment an attempt should be made to put the Church in a relation with the State not inconsistent with the historical ideals of either church. With the coming of the war, active negotiations were suspended, but the years of strife brought the two churches very closely together in many practical ways, *e.g.* in the temporary amalgamation of the divinity colleges, and in local parochial and congregational arrangements. With the advent of peace, the lines of the Memorandum having been already generally approved in both churches, a new step was taken by the formulation of a series of Draft Articles declaring the constitution and liberties of the Church. The United Free Church held that it was for the Church of Scotland alone to straighten this matter out with the State, and though it approved the Draft Articles as formulated it would not join in any approach to Parliament with a view to legislation. The Government was well disposed and in 1921 introduced and carried through a bill to give effect to the Draft Articles. The bill did not, of course, unite the two churches, but it was a step towards union. Opposition to it came from both sides. There were those in the Church of Scotland who said that it meant virtual disestablishment, and changed the whole nature of the Church's position in the State. On the other hand there was a body of opinion in the United Free Church, which saw in the bill rather the reëstablishment of the Church of Scotland, the retention of all its exclusive privileges, *e.g.* as to royal and Indian chaplaincies and university divinity chairs. Nor did this bill touch the teinds or tithe endowments. It must be remarked here that the United Presbyterian Church had been strongly voluntary, and that the Free Church, though it had not disrupted on this point, had also by the time of the Union in 1900 come to be a staunch supporter of the cause of disestablishment and disendowment. The bill of 1921 was to be followed by legislation dealing with the teinds and until this question of the patrimony of the Church of Scotland was settled there could be no technical negotiations for union.

The question of the teinds had come up in another connexion. Stipends of parish ministers in Scotland were regulated according to "fiars," *i.e.* the prices of grain legally struck or fixed at an annual court in each shire. During the war these prices rose enormously. The ministers found the result as agreeable as the heritors found it irksome, and considerable discussion (culminating in a Parliamentary bill introduced—and withdrawn—in the autumn of 1920) took place on attempts at compromise.

At both the Church of Scotland and the United Free Church Assemblies in May 1921 the Lambeth proposals were submitted in person by the Archbishop of Canterbury and the Bishop of Peterborough. These prelates were very heartily received and sympathetic replies were given by representative leaders. The official response of organized Presbyterianism was given at the Pan-Presbyterian Council, meeting in Pittsburg, U.S.A., in Sept. 1921. A joint conference of Anglicans and Presbyterians, meeting in Montreal during the spring of 1921, unanimously agreed on forms of service by which "extension of commission" might be given to and by the respective parties, but this agreement was personal rather than official.

In the matter of social problems and social service both churches have been active. The Church of Scotland appointed a commission on the war, and the result of its inquiries was a valuable survey entitled *Social Evils and Problems*, prefaced by a statement on "The Ethical Mission of the Church" by the Rev. Prof. W. P. Paterson. That the same church was alive to the needs of the hour was evidenced by the appointment in 1920 of a committee to inquire into the recrudescence of spiritualism. In the temperance campaign which preceded the first series of elections on the Local Option issue, the United Free Church was, as might be expected, more unanimous and energetic than the Established, though some powerful champions were found in the ranks of the latter. One particularly interesting scheme in which both churches were uniting in 1921 was a memorial to Scottish soldiers who fell in Palestine. This was to take the shape of an Archaeological Research school in Jerusalem with a Scots kirk attached. The two churches also coöperated in the endeavour to rebuild the broken life of their coreligionists in central and south-eastern Europe and to reëstablish mission work in Palestine and Syria, where the new conditions had entirely altered and complicated the situation. The churches gave of their best during the war in combatant and non-combatant and remedial services. The noteworthy volume entitled *The Army and Religion* owed much of its value to the editorial skill of Dr. D. S. Cairns of the Aberdeen U.F. College. The Scottish churches, like others, had not up to 1921 been receiving the recruits for the ministry that were expected on the cessation of war, and the position seemed likely to become acute in a few years' time. Even if the projected Union was accomplished, the experience of the United Free Church since 1900 showed that it would be a matter of some difficulty to get local congregations to unite even in places where all could be well accommodated in one building.

Among the smaller Presbyterian churches, the Free Church remained vocal, but made little progress and found it increasingly difficult to get ministers. Its chief strength was in the Highland and Western Islands. The Free Presbyterian Church, the Reformed Presbyterian Church and the Synod of United Original Seceders remained stationary.

The following figures give some idea of relative strength in Scotland:—

	Ministers and Evangelists.	Churches and Halls.	Church Members.	Sunday Scholars.
Church of Scotland . .	1809	1704	728,239	192,496
United Free Church . .	1707	1534	528,084	201,014
Free Church .	88	165		
Episcopal Church	350	410	56,000	
Congregationalists	183	183	36,615	26,909
Baptists .	117	149	21,537	18,462

Further particulars, also those relating to the smaller Presbyterians and to the Wesleyans and Primitive Methodist Churches, will be found in the respective year books and in the *Scottish Church and University Almanac.* (A. J. G.)

V. Churches in the United States

The most accurate statistics for the religious bodies of the United States in 1920 were undoubtedly those published by the Federal Council of the Churches in the *Year Book of the Churches*, the figures being so far as possible those reported by the church bodies themselves. Unfortunately, the progress made during the decade 1910–20 cannot be measured precisely, for trustworthy statistics are not available for 1910; the nearest approach are those of the U.S. religious census for 1906 published in 1909. Using these two sources, the number of local Christian church organizations of all forms in the United States is seen to have grown during 1906–20 from 208,678 to 234,370, the number of ministers and priests from 164,830 to 186,018; the membership from 32,447,741 to 44,322,215; the number of Sunday schools from 189,291 to 199,274; the Sunday-school enrolment from 16,238,083 to 20,892,327.

For Roman Catholic churches the increase during the same period was as follows, the figures for 1906 being taken from the U.S. census and those for 1920 from the *Official Catholic Directory*:—

	Church Organizations	Cardinals	Priests	R. C. Pop.
1906	12,482	1	15,177	14,210,755
1920	16,580	3	21,643	17,885,646

The growth of Protestant churches, as given by the census and the *Year Book* already cited, has been as follows:—

	Church Organizations	Ministers	Members	Sunday Schools	Sunday-school Enrolment
1906	194,980	146,437	20,201,885	164,577	13,002,241
1920	215,698	163,951	26,058,513	183,991	19,004,638

In comparing these figures with those already given for the Roman Catholic Church, it should be noted that the Roman Catholic figures include as members all baptized persons, whether confirmed or not. The Protestant practice is to include in a count of members only those who were communicant members when the enumeration was made. The estimated Protestant population, counting all members of any family in which anyone is a communicant member of a Protestant church, grew from 30,000,000 in 1906 to 40,000,000 in 1920, an increase of 33·3%. The increase of Roman Catholic population during the same period, as above shown, was 26%. An exact comparison between the growth of population and the growth of church membership is impossible owing to the fact that the population census and the religious census are not taken the same year but several years apart. A comparison of figures, however, indicates that the population of the continental United States increased between 1910 and 1920 at an average annual rate of 1·5%. During the period from 1916 to 1920, on the other hand, church membership increased at an average annual rate of 2·5%.

The World War.—Perhaps the most striking phase of the work of the churches during the decade 1910–20 was their service in the World War. As soon as the United States entered the war almost every church or denomination organized a war commission or council to aid the Government in securing chaplains and in similar tasks. The war-work commissions of the Protestant churches coöperated in the General War-Time Commission of the Churches; while the activities of the Roman Catholic Church were carried on through the National Catholic War Council. The General War-Time Commission, besides largely developing the spirit of coöperation, was able to undertake activities which were impossible to the separate church bodies, such as surveying the needs and opportunities for religious work in the camps and war communities; coördinating the plans and efforts of the denominational commissions; representing the Protestant churches in relations with the war and navy departments; securing qualified chaplains; providing for the moral and religious welfare of negro troops; supplying religious ministration for interned aliens; arranging for the welfare of workers in communities engaged in the manufacture of munitions and in shipbuilding; and stimulating the churches to coöperate with the Government and welfare agencies in the various campaigns for funds, food conservation, personal service, etc. Equally important work was done by the National Catholic War Council. Of the effect of the war on the American churches very little can be said. Expectations that the men would bring back from their experiences in the army or navy fresh interpretations of Christianity, and that the churches would apply in their local work many of the methods found effective among soldiers, have not been realized. Positive results, however, are: gain in practical coöperation among the churches, a larger place for the Church in the life of the community, stimulation and enlargement of missionary work and greater attention to education.

Coöperation and Union.—The decade 1910–20 was noteworthy among the Protestant churches for the development of coöperation and union. This appears in three fields: (1) local coöperation and federation, (2) coöperation of administrative bodies, (3) denominational federation and union. In the first of these, coöperation in local communities, there is to be noted a growing movement in the formation of federated churches, *i.e.* two or more churches joining their activities under the same pastor while each retains its separate organization and denominational affiliation. Several hundred of these federated churches have been organized, the Home Missions Council having (1921) a list of about 200. In many localities the growth of a community consciousness has expressed itself in one denominational church, serving the whole community, often having an associate membership for Christians of other denominational preferences, and carrying on a variety of activities for the uplift of the community. A notable development has been the exchange of territory between denominations in some of the older states, like Vermont, and the allocation of territory to home mission agencies of different denominations in newer sections, such as Montana, Alaska and Porto Rico. In larger cities federations or councils of churches have steadily grown in number and importance. Under the leadership of the Commission on Councils of Churches of the Federal Council of the Churches of Christ in America, first organized in 1912, such federations have been formed in nearly 50 cities, having strong local financial backing and employing one or more secretaries. Among their activities are social service, evangelism, religious education, religious publicity and missions. Important conferences on interchurch work were held in Pittsburg in 1917 and in Cleveland in 1920.

In the second field of coöperation, that of denominational administrative boards, the development has been principally in missions and education, culminating in the Interchurch World Movement. The World Missionary Conference held in Edinburgh in 1910 powerfully stimulated coöperation among foreign mission boards, and the Continuation Committee has represented the American boards in organizing coöperative work in foreign mission fields. The similar Congress on Christian Work in Latin America, held at Panama in 1916, was the outcome of a conference in 1914 of missionaries and Protestant mission boards working in Mexico. Among its results is the permanent Committee on Coöperation in Latin America, which unites in many forms of service most of the boards having work there. The Foreign Missions Conference of North America, organized in 1893, which officially represents the Protestant foreign mission boards of the United States and Canada, has during the decade 1910–20 greatly enlarged its sphere of activities, particularly through its Committee of Reference and Counsel, its Board of Missionary Preparation, and its Committee on Religious Needs in Anglo-American Communities. In home missions coöperation has been greatly furthered through the Home Missions Council, organized in 1908, which aims to prevent duplication of effort and to provide for adequate occupation of fields and in general to coördinate the home mission agencies of the denominations it represents. Similar coöperation has developed among women's mission boards, through the Council of Women for Home Missions (1908) and the Federation of Women's Boards of Foreign Missions of North America (1916). The decade 1910–20 stands out beyond all previous decades in missionary coöperation, so that by 1921, with but few exceptions, the leading Protestant missionary boards were thoroughly committed to this policy. The same was true, in scarcely less measure, of the educational boards. In 1911 these united in the Council of Church Boards of Education, which collated information, studied the standardization of courses in church schools and colleges, and held conferences of university pastors and other church workers in the larger institutions. The Sunday-school agencies of the denominations formed in 1911 the Sunday School Council of Evangelical Denominations, for coöperation in educational, editorial, missionary and publishing activities.

The Interchurch World Movement of North America was organized by representatives of Protestant mission boards in 1918, primarily to meet the urgent need of expansion in missionary work as a result of the war. It rapidly extended its scope, however, to include surveys of all Christian work at home and abroad, missionary education, recruiting for the ministry and mission service, and a simultaneous appeal for funds by all coöperative church bodies. The movement failed, owing, among other things, to unbusinesslike financial operations and irresponsible activity on the part of some of its leaders; but it revealed a widespread spirit of coöperation.

In the third field of coöperation and union, that of the denominations and church bodies as ecclesiastical organizations, the development has proceeded along two lines: federation and organic union. The first is represented especially by the Federal Council of the Churches of Christ in America, organized in 1908, in which about 30 Protestant denominations are officially represented. While retaining their autonomy the

uniting church bodies have provided representative organization which operates through various commissions, including those on the Church and social service, evangelism, councils of churches, the Church and country life, temperance, Christian education, relations with the Orient, international justice and goodwill, and relations with France and Belgium. A staff of secretaries at New York and Washington care for these activities.

Side by side with federation has developed a movement in the direction of organic union. In several denominations union has taken place, as between Baptists and Free Baptists, and among various Lutheran churches. There has been approach, also, between unrelated communions, as Congregationalists and the Protestant Episcopal Church. The year 1910 was notable: on the same day there was organized, by the Protestant Episcopal General Convention, the Commission on a World Conference on Faith and Order, and, by the Disciples of Christ, the Association for the Promotion of Christian Unity, while earlier in the same year the Christian Unity Foundation had been formed. Over 70 commissions have been appointed by various church bodies to coöperate in plans for the conference on faith and order. The proposal contemplated an organic union of all the churches, Protestant, Roman Catholic and Eastern Orthodox, on the basis of an agreement concerning essential doctrines. The Roman Catholic Church, however, declined to participate. Some important Protestant churches, also, look with little interest on the conference.

The tendency in the movement towards church unity has been toward, not a complete amalgamation of denominations, but a federal union which would allow for diversity of temperament, practice and doctrine. Such was the purpose of the Council of Organic Union held in 1918, attended by representatives of 19 Protestant denominations. An *ad interim* committee was appointed which presented a plan of union at a second conference, in 1920, to become effective when adopted by six denominations.

Social Service.—The widening interest in social questions was a notable development of the decade 1910-20. This showed itself, first, in the recognition of social service in the programmes of the various national church bodies, and, later, in its growing recognition by local churches. During the first half of the decade most of the larger Protestant denominations adopted in their national gatherings a definite social service programme, nearly the same as the "Social Creed of the Churches" put forth by the Federal Council of the Churches. A similar statement was published by the social service commission of the American Federation of Catholic Societies. Social service commissions or departments were organized by most of the larger denominations, many having executive secretaries in charge. The commission on the church and social service of the Federal Council has been one of the most active commissions of that body since its formation, and more recently the National Catholic Welfare Council has put in operation a vigorous social programme. One result of this development of social interest is seen in the place given in the theological seminaries to social service and training for community leadership. Quite as significant is the addition of these subjects to Sunday-school study courses. So far as the official organizations of the denominations are concerned, social service has become definitely established as a vital part of their programme.

Naturally the progress in the local churches has been slower, but it may be said in general that the churches have come to recognize their social responsibility, though in their working programmes they differ widely. While the movement of churches from the business sections of large cities toward the residential sections and suburbs still persists among Protestant churches, a tendency in the opposite direction has also developed, and well-organized churches are being established in the heart of large cities. In some cases several denominations have coöperated in apportioning the field. In Cleveland, for example, 30 such churches are planned, of which 10 are already in operation, different sections being cared for by different denominations. A similar and allied movement is the establishing of Christian centres or community houses. These are under church direction, are staffed by trained workers and undertake various activities: kindergartens, day nurseries, mothers' meetings, industrial classes, forums, boys' and girls' clubs, employment bureaus, rescue work, lectures, music classes, gymnastics, etc., besides Bible study and religious worship. In rural communities progress has been slower, but in many of the Protestant denominations larger attention has been given to the cultivation in the country churches of the ideal of thoroughgoing community service—religious, social, educational, economic. Both nationally and locally the churches, city and country alike, have exercised a powerful influence in favour of prohibition, and the adoption of the Eighteenth Amendment is due principally to their efforts.

In the field of industry, the social service pronouncements of the churches have been outspoken in favour of better conditions and opportunities for labour. Efforts have also been made to cultivate closer relations with the unions, as by sending fraternal delegates or appointing special representatives. The Federal Council of the Churches each year issued a Labour Sunday message for the first Sunday in Sept. and many churches observe the day.

Missions.—The American churches in their mission work have progressed in coöperation, organization and expansion. The decade opened with the holding of the World Missionary Conference at Edinburgh, in which American Protestant mission boards played a large part. As a result of this conference and the Congress on Christian Work in Latin America, held at Panama in 1916, and of the continuation conferences that followed in many mission fields, the boards have largely broadened their field of coöperative activities, particularly in educational and medical work. Other important factors aiding in this development have been the Foreign Missions Conference of North America, the Federation of Women's Boards of Foreign Missions, the Home Missions Council and the Council of Women for Home Missions, which represent most of the mission boards of the Protestant churches. The Edinburgh Missionary Conference resulted in increased efficiency of organization and greater interest in missions. In several church bodies missionary agencies have been combined and missionary administration centralized; steps have also been taken toward uniting the missionary agencies of different denominations. Increased attention has been given to missionary education, through study groups, women's societies, Sunday-school classes, and reading contests. Interdenominational summer conferences and schools for development of missionary leaders have grown rapidly in number and quality of work. A very important movement has taken place in the securing of new missionaries. Some denominations have appointed candidate secretaries for their mission boards, and interdenominational conferences have been held to consider the problem. The most significant development in this connexion was the organization in 1911 of the Board of Missionary Preparation, which made a thorough study of the best methods of preparing for work among peoples of different lands and different religions.

The rapid expansion of mission work by the American churches during the decade will be evident from a few figures. For home missions the Protestant churches appropriated in 1912 (the first year for which figures were compiled) $10,653,119; in 1920, $23,135,601. The number of home missionaries fully supported by the church boards in 1916 was 3,372; in 1920, 4,473. Foreign mission income grew even more rapidly, the figure for 1910 being $11,946,281 (including both the United States and Canada); in 1920, $40,292,602. The number of foreign missionaries sent out was as follows (United States and Canada):—

1910	617	1916	772
1911	818	1917	661
1912	812	1918	641
1913	620	1919	1,137
1914	531	1920	1,686
1915	609		

In 1910 the Roman Catholic Church had 20 American foreign missionaries; in 1920, 50. The first American Roman Catholic foreign mission seminary was founded during the decade, and several religious orders of this Church were engaged in preparing men and women for the foreign mission field.

While new enterprises have been undertaken the policy has been primarily to strengthen existing work. Expansion has taken place especially in union schools, colleges, hospitals and other institutions. Many denominations have frankly faced their whole task in those parts of the world which might be considered as their responsibility, and after careful survey of the needs and requirements they have undertaken financial campaigns covering home and foreign missions and education. The total number of these forward movements was

26, the total objective being nearly $400,000,000. In most cases, for various reasons, the completion of the financial campaigns was delayed, but large sums were secured by all the denominations and the work was correspondingly strengthened.

In continuing the attention of the churches to evangelism (in the larger sense of enlisting individuals in the programme of Christianity) a variety of methods has been employed. The earlier years of the decade saw the development of spectacular mass meetings led by a professional evangelist, this method reaching its culmination just before the war. In the latter part of the decade, however, more attention has been given to the work of the pastors themselves. City-wide campaigns, in which all or most of the churches coöperate, with services conducted by them separately but according to a uniform plan, became common. Many denominations have departments and secretaries of evangelism, who coöperate with the Commission on Evangelism of the Federal Council in developing interest and organizing the work.

Education.—Religious education advanced conspicuously during the decade. In 1910 the Sunday-School Council of Evangelical Denominations was formed, representing the official Sunday-school agencies of the Protestant churches; in 1912 the World's Sunday-School Association added to its executive committee the official representatives of the church boards; in 1914 the International Sunday-School Lessons-Committee took similar action; and in 1920 plans were made to amalgamate the International Sunday-School Association and the Sunday-School Council. The significance of

STATISTICS OF CHRISTIAN CHURCHES IN THE UNITED STATES—1920

As given by *Year Book of the Churches for 1920.*

Name.	Church Congregations.	Ministers.	Members.	Sunday Schools.	Sunday-school Members.	Total Expenditures.
Adventists	2,772	1,526	123,143	3,177	113,629	$ 2,505,786

[1] As given by *Official Catholic Directory.*

[2] The Roman Catholic Church includes in its membership, as already stated, all who have been baptized—that is, practically all the members of Roman Catholic families. Protestant churches, on the other hand, reckon as members communicants only, with the exception of a few denominations, *e.g.* Lutherans, who publish figures for both communicant members and baptized members. The statistics given for Protestants in this table, as elsewhere in this article, are for communicant members only.

these changes lies in the growing recognition of pedagogical principles in the church school. Schools having graded departments and a graded curriculum have increased in number, and the higher standard of work has resulted in the creation and use of an increasing body of technical material for teachers and executives. The importance of a trained teaching force is gaining larger recognition; standard normal courses have been improved; summer schools of methods have grown in number and attendance; and community schools of religious education, meeting on a week-night for an extended period, with classes studying the Bible, pedagogy and departmental methods, having sprung up rapidly in many parts of the country. This new interest in religious education has led to important developments. A new religious profession is growing up, that of director of religious education in a local church. Colleges and theological seminaries have established courses in religious education, and several have organized departments or schools for the study of this and allied subjects. Especially noteworthy is the providing of rooms for school uses in Protestant churches as a result of the increased attention to the educational side of the work. This change began before the decade under review, but has now become practically universal in its influence. Finally, it is being recognized that the ordinary Sunday-school session does not give sufficient time for proper religious instructions, and various methods of week-day instructions have been adopted, by churches separately, or by groups of churches, or in cooperation with the public schools.

There is a growing feeling of responsibility for their educational work on the part of the churches. Boards of Education have been organized by some denominations and those of others have been strengthened; most of the movements have included in their financial objectives large sums for education; and the relations between the churches and the schools and colleges, both denominational and undenominational, have been made correspondingly closer. This interest has grown since the war. The Knights of Columbus, for example, set aside a very large sum for educating worthy men, regardless of their church relations, and Protestant churches have correspondingly enlarged their programme. Roman Catholic institutions have also conducted financial campaigns and largely increased their funds. Most of the money has been raised for the equipment or endowment of institutions related legally or by tradition to the various churches, with a resulting increase in facilities and strengthening of teaching force. In most of the denominational schools and colleges the Bible has a prominent place in the curriculum, the number of chairs of Biblical literature or religious education having increased to about 200. An important development of the decade has been the installation of university pastors by various denominations in connexion with the larger institutions, to care for their own students, to keep them in touch with the church, to give friendly counsel in their problems, to organize Bible classes, etc. In smaller institutions several denominations combine in the support of one representative. There were 320 of these workers in 1920 giving whole or part time to the work. A student church has been organized in a few centres, and some denominations have undertaken the establishment of a school of religious education in connexion with a university. All these church representatives work in close relation with the student Christian associations. Student conferences, directed by the Y.M.C.A. and Y.W.C.A. or by the denominational education boards, have grown in importance. Cooperation with these two organizations and with one another through the Council of Church Boards of Education (organized 1911) has been a growing feature of the educational work of the churches during the decade.

In the development of thought religious experience has become increasingly the test of doctrine, and interest has shifted from dogma to life. Religion is thought of in terms of this life, not primarily with reference to the next, considered not as belonging to one part of man's life but as affecting the whole range of human experience.

There was notable growth during the decade in (1) laymen's activities, especially in the Laymen's Missionary Movement, the Men and Religion Movement and the Y.M.C.A.; (2) religious publicity, manifested in the combination and strengthening of church papers and the increasing use of secular newspapers and magazines for advertising and descriptive articles; and (3) international relations, in which there has been a widening of interest and an enlarging of activity through denominational and inter-denominational organizations. (S. R. W.)

CILICIA (*see* 6.365).—During 1909–21 the old geographical name of Cilicia came again into familiar use, chiefly in connexion with Armenian matters. The ancient district of Cilicia covered nearly the same territory as the mediæval kingdom of Lesser Armenia, and the present population includes a considerable Armenian element. This portion of south-eastern Asia Minor, therefore, is regarded by Armenians as a region which should form part of an independent Armenia, or itself become an independent protected Armenian state until the greater project can be realized. Unhappy events in recent Armenian history have been enacted in Cilicia, largely owing to Armenian aspirations; thus convenient usage has linked the ancient name with the fortunes and tragedy of the Armenian race. Cilicia of present Armenian interest includes the Turkish vilayet of Adana, the independent sanjak of Mar 'ash, and the sanjak of 'Aintab in the vilayet of Aleppo. In these areas there were, in 1914, about 175,000 Armenians, while the population included some 500,000 Moslem and other elements.

The recent history of Cilicia belongs, in the main, to the history of the Armenian people (*see* ARMENIA). In 1909 the Adana massacres—destructive of hopes created by the Turkish Revolution of 1908—extended over the whole of Cilicia. During 1915–6 massacres and deportations organized by the Young Turk Government destroyed or removed the greater part of the Armenian population—including the 20,000 inhabitants of Zeitun, an Armenian mountain stronghold, never hitherto entirely subdued. In 1918–9 Cilicia was occupied by British troops after their conquest of Syria, but on being evacuated by them passed under French control. Subsequently the Treaty of Sèvres assigned to France the southern portion of Cilicia, as far westward as the left bank of the river Jihan, as part of the mandated territory of Syria. The remainder of Cilicia was brought within the French sphere of influence in Asia Minor by the Tripartite Agreement, executed at the same time as the Treaty of Sèvres.

Under French occupation Cilicia received a large immigration of Armenians owing to their reliance on French protection and the hope—apparently without much foundation—that a Franco-Armenian state would be created. The province was the scene of continued warfare between French troops and Turkish Nationalists during 1920, in the course of which the Nationalists gained several successes, and were able to renew the massacre of Armenians on a large scale. In the spring of 1921 an agreement was signed on behalf of the French and Nationalist Governments whereby France was to evacuate Cilicia, and the southern frontier of Turkey, as defined in the Treaty of Sèvres, was to be removed southward about 40 miles, for the whole distance from the Gulf of Alexandretta to the frontier of Mesopotamia. These proposed territorial concessions by France the Great National Assembly at Angora considered inadequate, and in consequence it refused to ratify the agreement; and in September 1921 France, therefore, still remained in occupation of Cilicia. (W. J. C.*)

CINCINNATI (*see* 6.370).—During the decade 1910–20 the area of Cincinnati was extended from 44 to 72 sq. miles. The pop. in 1920 was 401,247, as compared with 363,591 in 1910, an increase of 37,656, or 10·4%. In 1920 the city possessed parks covering 2,691 ac., including the Mt. Airy Forestry project which embraces 1,132 ac.; and a plan was being carried out for further extension by utilizing the boulevards and bluffs. The widely discussed statue of Lincoln, by George Grey Barnard, presented to the city by Mr. and Mrs. Charles P. Taft, was unveiled in Lytle Park in 1916. The city was building in 1921 a rapid transit loop at an initial cost of $6,000,000, which with subway, surface and elevated railways will encircle the city, provide access to inter-urban traffic and relieve congestion. The traction roads were being operated under a service-at-cost contract.

Manufactures.—In 1919 there were more than 2,200 manufacturing establishments in Cincinnati proper, covering 90 industries, with capital of $565,000,000 and products valued at $600,000,000, employing 112,000 persons of whom one-fourth were females. The five most important industries in the Cincinnati district were soap and soap products, $100,000,000; foundry and machine-shop products, $50,000,000; slaughtering and meat packing, $45,000,000; clothing (men and women), $35,000,000; printing and publishing, $30,000,000. In 1916 the freight movement by boat was 1,411,149 tons, of which 1,252,739 were receipts. The chief cargoes were coal, stone and sand, lumber and grain.

Government.—A new charter was adopted on Nov. 6 1917 providing that the city "shall have all the powers of local self-government and all other powers possible for a city to have" under the state constitution. The mayor and council were to be elected for a term of four years, the chief executive offices to be filled by appointment of the mayor. The charter provided for a city planning commission of seven members, consisting of the mayor, the director of public service, the three park commissioners and two citizens. It was to submit recommendations for new streets, subways, bridges, playgrounds and parks. In 1919 an ordinance was enacted forbidding the erection or maintenance of billboards within any residential block without the written consent of the

owners of the majority of property on both sides of the street. In 1920 the city's aggregate receipts, including balances on hand, were $24,346,445 and disbursements $17,330,791 leaving a cash balance, practically covered by authorizations, of $7,015,654. The tax valuation for that year was $737,472,310. The rate of taxation was $20.02 per thousand. The municipally owned waterworks and the Southern Railway, also municipally owned, were more than self-supporting. As a result the net debt not self-supporting on Dec. 31 1920 was $37,887,582.

Education and Charities.—In the decade 1910–20 extensive additions were made to the Jewish, Good Samaritan, Bethesda, and Christ hospitals, and to the tuberculosis sanatorium. The General hospital with its group of 24 buildings, occupying 27 ac. and considered the best example of the pavilion type on the continent, was finished in 1915 at a cost of $3,500,000. Its capacity in 1920 was 850 beds. It is under the administration of the university of Cincinnati, whose new medical school adjoins it. Other new buildings and departments of the university (3,565 students in 1920) included the law school, the college of engineering and commerce, the college for teachers, the training school for nurses, the school of household arts, a department of hygiene and physical education, a new gymnasium and athletic field, evening departments, and a woman's building. The coöperative system, originated in Cincinnati, of supplementing college instruction by practical training in various shops and manufacturing establishments, was greatly expanded between 1910 and 1920. Several new high-school buildings were erected, with improved class-rooms, laboratory, and gymnasium facilities which served to complete an educational system which carried the student at public expense from the kindergarten through the graduate schools of the municipal university. The public school expenditures for 1920 were $4,749,605. The enrolment of the day schools was 51,104 and night schools, 14,864, with 1,625 teachers in 70 school buildings, including 5 high schools. The Roman Catholic university of St. Francis Xavier in 1919 removed its college department to a 26 ac. tract in the suburbs adjoining the newly developed boulevard system of the city and constructed administration, science and recitation buildings. The colleges of music increased in buildings and faculties; and in 1915 the Cincinnati Symphony Orchestra received an endowment of $1,000,000 as a bequest from Cora M. Dow. Of special importance was the recent establishment of the American House for the training of aliens for citizenship, and for social service work.

Building.—Between 1900 and 1919 nearly $100,000,000 was spent in new buildings, among which were the Union Central Life of 34 storeys, 495 ft. high, the tallest building west of New York City; a court house, in modern Ionic style, completed in 1919 at a cost of $5,000,000; and the Dixie Terminal for the Kentucky traction lines.

World War.—During the World War Cincinnati supplied 1,200 men to the Marine Corps; 1,400 to the navy, and 15,000 to the army. To the Liberty and Victory Loans Cincinnati subscribed $212,946,300. (C. T. G.)

CINEMATOGRAPH OR MOTION-PICTURES (*see* 6.374).—The word "cinematograph," frequently shortened to "cinema," designates primarily the mechanism by which motion-pictures are projected on to the screen, but the term has come to be used generically to refer not only to the entertainment but to various phases of its production. In the United States, the designation "motion-picture" or "moving-picture" (colloquially, "the movies") is much more frequently used, though "photoplay," referring specifically to dramatic compositions, is commonly employed.

In 1910 the cinematograph as a means of entertainment was making its first bid for public favour; it was still a novelty, and many persons, including experienced showmen, thought its appeal would decline as soon as the novelty had been thoroughly exploited. Before 1920, however, it had become by far the most popular form of commercialized amusement throughout the world. The production of motion-pictures on a large scale was in 1920 confined to a few countries, chiefly the United States, Great Britain, Italy, Germany, and France, but their exploitation was world-wide. Their appeal was apparently limited by no ordinary conditions of age, race, or degree of civilization, and it was asserted, a little grandiloquently perhaps, that they constituted the one universal language. In 1920 it was estimated there were throughout the world at least 40,000 cinema theatres, of which perhaps 17,000 were in the United States, 5,000 in the British Isles, 3,200 in Germany, 2,700 in France, 1,000 or more in Italy, 1,000 in Spain, 800 in Australasia, 700 in Sweden, 600 in Japan, and so on. There was hardly a country too remote not to have at least a few motion-picture theatres, and occidental films had penetrated where occidental ideas were still regarded with prejudice and disfavour. Constantinople, for example, had 11 cinema theatres, Canton 10, Bangkok 9, Rangoon 8, and Tientsin 6. Such theatres, of course, exhibit American, English or European films almost exclusively. It is perhaps interesting to note that in Constantinople only religious pictures were subject to censorship. In South America the cinema was as popular as elsewhere; Buenos Aires, for example, had 131 theatres, and nearly every Argentine town of more than 1,000 population had its moving-picture palace. In the United States the daily attendance at motion-pictures in 1920 was estimated at a little less than 10,000,000, while a British estimate in 1919–20 was that a number equal to half the population of the British Isles attended the cinematograph twice a week—which would be equivalent to a daily attendance of more than 6,000,000. If this estimate is correct it indicates that the cinema attendance in the United Kingdom practically doubled after 1916·7, when a careful estimate placed the daily attendance at 3,375,000 (see *The Cinema*, 1917). The same report gave the following analysis of seats occupied in the course of a year (week-days):—

Price of seat	No. occupied	Per cent of total
1d.	78,250,000	7·4
2d.	58,844,000	5·6
3d.	400,640,000	38·0
4d.	186,235,000	17·6
6d.	195,468,500	18·5
9d.	97,812,500	9·2
1s.	39,125,000	3·7
Total	1,056,375,000	100·0

(This tabulation is based on an estimate of 4,500 theatres with an average daily attendance per theatre of 750. In 1917 the price of seats had begun to go above 1s.; in 1920 in London it was frequently 2s., 3s., and higher in the best houses.)

From the business point of view remarkable progress was made during the decade 1910–20. In the United States, where the industry had reached its highest commercial development, the gross receipts of all exhibitors in 1920 were placed at $800,000,000 (as against $675,000,000 in 1918 and $65,000,000 in 1907). The price of admission was usually from 25 to 50 cents; in small towns or poorer neighbourhoods it was sometimes less, while the best houses in New York frequently charged from $1 to $2.50.

U.S. Government statistics show that the total gross income of American motion-picture producers (manufacturers) was about $90,000,000 annually. Capital invested in the producing business was estimated at $100,000,000, while the amount of positive film "consumed" each week was said to be 10,000,000 ft., as compared with 3,000,000 ft. before the World War. The following table shows the operations of one of the leading American film companies (Famous Players-Lasky): —

	1919	1918
Gross income	$27,165,327	$18,090,500
Cost of film production	16,815,636	12,647,320
Cost of selling and distribution	5,822,860	3,904,918
Other expenses	1,393,846	257,087
Operating profit	3,132,985	1,281,175

The outbreak of the World War favoured the growth of the industry in the United States to such an extent that it became by far the leading producing country in the world. In most European countries, as well as elsewhere, the majority of films displayed after 1915 were of American origin. About 75% of the films shown in Great Britain in 1920 were of American manufacture. The extent of American exports in that year is indicated by the following table:—

U.S. Exports of Exposed Films.

	Linear Ft.	Value
United Kingdom	45,538,551	$2,348,256
France	22,250,847	943,781
Canada	17,052,511	1,226,514
Australia	14,238,587	653,047
Argentina	9,920,491	330,104
Brazil	8,416,158	363,544
Cuba	6,761,701	248,226
Japan	6,302,468	233,028
Spain	6,071,560	242,569
Denmark	5,816,537	233,646
Norway	3,410,232	330,770
Newfoundland and Labrador	1,950,337	79,541
Italy	677,120	30,273
Other countries	39,220,065	1,625,236
Total	188,527,165	$8,888,535

European production, however, was beginning to regain lost ground; artistically the best European work was not infrequently superior to that produced in America. Germany's recovery seemed particularly rapid; this was due in part to legislation prohibiting the importation of foreign films until May 1920, and even after that date the introduction of foreign films was to be strictly limited. In England producers were making great efforts to meet American competition, though without the aid of legislation. The manufacture of motion-pictures in Great Britain, however, suffered from the handicap of a climate which, being often dull and lacking in sunlight, was not well adapted to photography. This handicap was partly overcome by improved methods of artificial lighting. Gross receipts from all cinema theatres in the British Isles were estimated in 1920 to be about £35,000,000 annually. Data for other countries were lacking; in France, however, the official statistics for Paris show that in 1919 the receipts of cinema theatres in that city were 49,664,661 francs as compared with 26,388,292 francs in 1918 and 17,377,000 in 1917. Admission prices ranged from 1.50 francs to 2.50 francs.

In 1919–20 some of the larger American companies sought and obtained financial assistance from leading banking houses, which had hitherto held aloof from the industry. As a condition of this assistance the banking interests indicated they would insist upon greater attention to economy and conservative business practice than had characterized the industry in the past. The sudden prosperity of the film producers had naturally led to lavish expenditures; this is well illustrated by the amount of the salaries paid to motion-picture actors and actresses. Towards the close of the period 1910–20 capable actors of the legitimate stage were able to obtain from $100 to $400, and in relatively few cases as high as $1,000 a week; cinema salaries, however, were in most cases at least twice as large, while favourite "stars" were frequently able to command a weekly salary ranging from $5,000 to $10,000. Even these figures were surpassed in the case of a few of the best-known popular favourites; the combined annual income of three leading stars, for example, was said to be $1,500,000 (1920). After 1920 the influence of conservative investors was beginning to make itself felt, and there was a tendency to reduce salaries and to introduce other economies. It was seen that this new influence would make for greater stability in the industry and probably for better pictures.

Mechanical Progress.—The popularity of the moving-picture led to much research to determine its inventor, and the difficulties were not altogether removed by the assertion of Thomas A. Edison (see his letter to the New York *Times*, June 9 1921) that the honour belonged to him. It is true that the modern cinematograph was evolved out of Mr. Edison's kinetoscope, or kinetograph, though these devices likewise owed a great deal to earlier experiments. But the prototypes of the modern projecting machine seem to have been produced by others—apparently by three men: Louis Lumière in Paris, R. W. Paul in London and C. F. Jenkins in Washington, D.C., each of whom was engaged virtually at the same time (1894–5) on the new invention. Their efforts all contributed to the final result, and the cinematograph of 1920 had not changed greatly from what it was 25 years before, when, relying on the well-known psychological principle of persistence of vision, it was first made a practical device for reproducing "animated pictures" on the screen. In matters of detail, however, great improvement had been made.

An important advance was the adoption of a standard film, 1⅜ in. in width, with 16 pictures, sometimes called "frames," each 1 by ¾ in., to every foot of film. Near the margins of the film, on either side of the pictures, are sprocket holes by means of which the strip of miniature photographs is run through the projector at the rate of approximately one ft. a second, about the lowest practicable speed to give a satisfactory illusion of motion. On the reels used in the projectors about 1,000 ft. of film could be wound; the term "reel" thus came into use as a unit of measure. The elimination of "flicker," which caused much annoyance in early cinematograph exhibitions, was brought about partly by improving the mechanism which draws each succeeding picture momentarily into place and partly by increasing the number of revolving shutter blades from one to three, of which one serves to cut off the light while the change of picture is effected and the other two merely increase the frequency of the alternations of light and darkness, thus rendering them less noticeable.

Other valuable improvements were made in the nature of the screen on which the image is thrown, in the quality of the lenses, and in the electric lamp used to illuminate the film pictures. In the early days of cinematograph projection the danger arising from the inflammable nature of the celluloid film was very great. An effort to reduce this danger was made by interposing a trough of circulating water between the electric arc and the optical condenser to absorb the greater part of the heat rays. A safety shutter was also devised to cut off the light from the film when the motion of the latter was halted for any reason. Strict enforcement of regulations requiring that machines be enclosed in fire-proof "booths" while being operated greatly reduced the danger of serious fire losses when film did become ignited. After 1913 a non-inflammable film, made of acetate of cellulose, was put on the market; unfortunately films of this material were found to be less durable than those of celluloid, and were not widely adopted.

The cinematograph camera, being in a sense merely the reverse of the projecting mechanism, was developed along similar lines; and the best models were adapted to record almost any moving scene with great fidelity. Although somewhat cumbersome they were still easily portable, making it possible to use them in remote explorations as well as in picturing current events. In commercial practice, the films, after exposure were mounted on frames (holding from 150 to 300 ft.), developed often by means of machines, fixed and washed in large tanks, and then wound on drums, 5–10 ft. in diameter, and dried by being rapidly revolved in warm, dry air. From the resulting negative it was possible to print as many positives as might be desired. This was ordinarily accomplished by means of a printing machine in which the strip of negative, superimposed on a strip of unexposed positive film, moved past an illuminated opening with an intermittent motion, somewhat as in a projecting machine. As long as the negative is preserved it is possible to obtain fresh reproductions of the original picture.

Colour Pictures.—The first colour pictures were made by colouring each small picture or frame by hand. This was laborious and expensive, therefore not well adapted for wide exploitation. The most successful of the early efforts to reproduce natural colour by mechanical means was that of Charles Urban and George A. Smith of London, whose "Kinemacolor" pictures were for a time very popular; the Kinemacolor representations of the Coronation of King George V. (1911) and the Durbar at Delhi were displayed all over the world. Although never entirely satisfactory, the essential features of Kinemacolor had an important bearing on later experiments, and for that reason may be briefly noted. The pictures in this process are taken through a revolving screen or light filter which exposes alternate spaces on the sensitized film to the green and the red rays, respectively, so that each pair of frames represents all the colour values that may be derived from these two primary colours. The resulting negative is black and white. In projection a revolving filter corresponding to that employed in the camera is used, with the result that alternating green and red pictures are displayed; but because of the rapidity with which this is done the eye fails to distinguish between the two and a colour combination is effected. The process involved additional expense for the exhibitor for the reason that special equipment designed to project the pictures at twice the normal speed was required. This objection might not have proved material if the representation were free from certain obvious faults such as false colour values, arising from the use of only two primary colours, and "fringing," due to the fact that a certain time elapses between the exposure of each negative, the result being that a moving object will often occupy a slightly different position in the "red" frame, for example, from that which it occupied in the preceding "green" frame. Thus when the two frames are combined there is an imperfect "register" of colours.

Later experimenters endeavoured to overcome these difficulties by various means; in the process exhibited by Léon Gaumont in Paris in 1912 three lenses were used to produce three-colour images simultaneously; in reproduction, of course, the process was reversed. Another device, displayed at the American Museum of Natural History (New York) in 1917, elaborated the Kinemacolor process by exposing the negative through a four-colour—red-orange, blue-green, yellow and blue-violet—revolving filter; the filter used in projection, however, contained only two-colour divisions. A promising development in 1921 was the process invented by W. H. Peck of New York. This is a two-colour method, but it differs from Kinemacolor in that each pair of negatives is obtained simultaneously by means of a prism which splits the light so that part of the rays are directed to one frame and the remainder to the other. After development the "green" negative frames are printed on one side of the positive film, and the corresponding "red" frames on the other; the positive is then developed and passes through a series of vats and tanks, coming out coloured, dried and ready for exhibition through the ordinary projection machine. The production of the positive is a complicated process, and it remained to be seen whether it could be successfully employed commercially. The result nevertheless seemed to approximate the requirements of an ideal colour film, which should consist of a series of pictures, each a complete colour-rendering of the subject in itself, so that the film could be exhibited on any machine at a normal speed. Despite the progress made in colour photography the majority of films displayed in 1920–1 were still in black and white, or in some monochrome tint which could be obtained either by dyeing the film itself or by placing a colour screen in front of the projection lens. Some colour films were made by an adaptation of the hand process in which the colouring is done with the aid of stencils.

Vocal Pictures.—The invention of the phonograph had preceded the moving-picture by about 18 years; it was natural, therefore, that efforts should be made to synchronize the two in order to produce talking pictures. Encouraging results were obtained by Léon Gaumont in Paris as early as 1910 and two years later by Thomas A.

Edison in America. The usual method was to make the phonographic record first, the actors merely speaking their lines into the gramophone without attempting to pose before the camera. Rehearsals were then necessary to enable the actors to fit their actions to the dialogue as repeated by the record already obtained; and the only remaining problem was to ensure a synchronization in the theatre of the phonograph and the picture. This was accomplished by means of electrical devices to control the speed of the phonograph. For various reasons, most of which will be obvious to any one familiar with the phonograph, this sort of talking picture never became popular; instead of enhancing the representation, the phonograph seemed merely to emphasize its artificiality. Later in the decade other methods, seemingly more adequate to give the necessary illusion, were devised and exhibited. The later experimenters abandoned the gramophone altogether; in the scheme elaborated by Eugene Lauste of New York the sound waves are transferred, by means of microphones, to a circuit containing a sensitive string galvanometer, and the fluctuations of the string or wire of the galvanometer are recorded photographically on the side of the film. When developed one side of the film shows a series of peaks resembling the profile map of a mountain range. Reproduction is accomplished by the use of a selenium cell placed in front of the moving film; the sound waves are then conveyed electrically to the rear of the screen and disseminated through loud-speaking telephones. The cinema industry showed comparatively little interest in vocal pictures and their future was uncertain. Another problem which engaged the attention of inventors concerned the discovery of some method of obtaining stereoscopic effects on the screen. One solution of the problem failed of success because, in order to complete the illusion, every spectator was required to wear a pair of specially devised spectacles; most audiences, it was found, were not only reluctant about putting them on but took little pleasure in the result, even though the effect was superior to that of a flat picture.

Recreational Aspects.—Improvements in apparatus, while important, were overshadowed during the decade 1910–20 by the truly remarkable achievements in developing the artistic, educational and recreational possibilities of the cinema. It is true that in 1910 the cinema had begun to outgrow that early period when its repertory consisted largely of express trains, automobile races, military parades and like subjects. The first step had been taken, and the pictures began to be connected by a story; the express train, for example, suggested the pictorial possibilities of a train robbery, and a story was invented to give the scenes continuity and culmination. Then the story became the chief thing. But the development in the cinema of the story-telling art was hindered by the circumstances of its early exploitation. The pictures of that period were exhibited either as part of vaudeville entertainments, where they took the place of the usual feats of legerdemain, or in cheap halls that had been converted from other purposes; the latter were usually dark, ill-ventilated and far from clean. Every circumstance of their presentation tended to discourage attendance by the better classes of the community. Yet their cheapness—the admission price was usually five cents in the United States and fourpence, or less, in England—attracted thousands of people for whom no amusement of so absorbing a character had ever been provided at so small a cost. Wherever the moving picture was introduced similar conditions prevailed; the initial appeal was almost uniformly to the illiterate, the half educated, and even, as it seemed, to the mentally incompetent. Probably no art ever developed under so great a handicap; the result, still obvious in the crudity and vulgarity of later films, was too often attributed to some inherent coarseness of the medium rather than to the unhappy conditions of its origin. But it was not only the character of those early audiences which left its impress on the cinema art; it was also the character of the men who engaged in this new industry. They were for the most part showmen of the itinerant, hand-to-mouth type, promoters and managers of the cheapest forms of vaudeville entertainment. Some of them remained exhibitors only; others began to assemble companies and produce motion-pictures. While many persons of intelligence and ability had been attracted to the industry by the end of the decade, not a few of the most influential men in the business were those who had been carried to success by the sheer momentum of the new art; they were survivals of that early group of showmen whose hope of profit lay in exploiting the crudest instincts in the most obvious fashion.

Yet in estimating the social influence of the moving-picture, even in that early period, it would be a mistake to overlook the fact that in many localities the cinema afforded the only effective competition with the allurements of the saloon and public-house. However bad the pictures were, and they were usually aesthetically rather than morally reprehensible, nevertheless they were a positive benefit in comparison with many types of amusement that were open to the poorer classes. When the workingman's family began to insist that he take them to the moving-picture palace of an evening he found it more difficult to offer an excuse for going to the bar. With the advent of Prohibition in the United States the motion-picture interests profited greatly; the cinema then became one of the most effective substitutes for the liquor saloon.

It is not surprising that for an appreciable interval many actors who had achieved fame on the stage refused to act for the "movies." Cultivated opinion was inclined to scorn if not to denounce the photoplay. For a time it seemed improbable that the moving-picture could ever be lifted above the vulgarity of its origins. The cinema seemed to be held in a vicious circle; exhibitors were afraid to raise the admission price, yet the fee was too small to pay for a better theatre or to justify spending more money for better pictures. Between 1910 and 1912 attendance actually began to fall off; even the public whose attention the "nickelodeon," as it was called in the United States, sought to challenge, appeared to grow tired of what, after all, was only an attempt to compete with the old-fashioned "dime novel" and "penny dreadful." A few far-sighted producers perceived that radical measures must be taken if the commercial possibilities of the motion-picture were to be advanced beyond those of a third-rate vaudeville attraction. The first step was to break down the prejudice of recognized artists, for as long as the cinema was held to be an object of ridicule, beneath the dignity of persons of artistic or cultural pretensions, it was hopeless to try to interest the public at large in the new art. An American producer accordingly set about to persuade Mme. Sarah Bernhardt to appear in moving-pictures, his theory being that if the best-known living actress should in this way give her sanction to the cinema the rest would be easy. Mme. Bernhardt, it is said, was won over on the plea that she ought to leave future generations some permanent record of her great art. The result marked something like an epoch in the history of the motion-picture; the old-time prejudice began gradually to give way, and the cinema, now certain of its ability to pay high rewards to popular actors, was soon attracting some of the best theatrical talent. Money was lavishly spent on huge productions that required six months or a year to complete; and a finished picture was likely to cost from $100,000 to $200,000 instead of from $10,000 to $20,000 as formerly. The Bernhardt films—*Camille* and *Queen Elizabeth*—were followed by such productions as *Quo Vadis*, *Les Misérables*, *Tess of the D'Urbervilles* (with Mrs. Fiske), the Italian film *Cabiria*, written especially for the cinema by Gabriele D'Annunzio, and *The Birth of a Nation*, produced by D. W. Griffith. *Cabiria* and *The Birth of a Nation* deserve especial notice aside from their excellence as dramatic spectacles, because it was with these films particularly that the first effort was made to compete directly with the legitimate theatre; not only were they presented with full orchestra accompaniment in theatres hitherto given over to the spoken drama, but admission prices were raised to the highest scale for Broadway or West End productions. The success of these ventures had the effect of raising the standards of the cinema theatre in every direction; better theatres adapted solely for motion-pictures were built, permanent orchestras installed, prices increased, undesirable patrons barred; and exhibitors who had formerly looked for support from the riff-raff of the town discovered it was more profitable to appeal to the less impecunious and more self-respecting classes of the community.

There followed a period of keen competition with the legitimate drama. In many communities the motion-picture entirely usurped the place once held by the older art. Many

stock companies were forced out of existence, while the prospect of making a profitable tour with a metropolitan success was rendered more and more precarious.

An American dramatic critic has cited the case of his home town, Pittsfield, Mass., a city of 40,000 pop., and the situation that developed there may be taken as typical of what was happening all over the United States and elsewhere as well. Before the advent of the motion-picture Pittsfield had one theatre devoted to the legitimate drama; here were presented at intervals many of the plays that had attained success on Broadway. But the cinema changed all that; the one legitimate theatre was transformed into a motion-picture "palace," and four new "movie" theatres were opened. Friends of the cinema urged that the casualties brought about by the onward sweep of the new art were on the whole richly merited.

Certainly the grave apprehensions once entertained for the future of the dramatic art were ill-founded; it was natural that the new form of amusement should menace the existence of the cheaper and usually inferior grades of theatrical production, but it became equally evident that each form of dramatic story-telling had its place, and neither one, if properly conducted, need fear the other. It might even be urged that in some respects the competition produced a beneficial effect on the stage. The alleged menace of the cinema came into prominence in a new form in 1919 when an American film company (Famous Players-Lasky) purchased the theatrical business of Charles Frohman, Inc., which included control of the Empire theatre in New York City. It was assumed that this invasion of the legitimate stage might result in making the latter a mere appendage of the cinema theatre, but less than a year after the purchase of the Empire Jesse L. Lasky confessed that "the experiment has not been a great success; we have found that the screen can borrow very little from the stage" (*North American Review*, Aug. 1920).

Technique of Production.—While aesthetic theory and practice remained in a somewhat chaotic state, the technique of production had been brought to a very high degree of perfection. In 1920 at least 80% of American films were produced in or near Los Angeles, where the brilliant sunlight makes it possible to operate the cinema camera almost continuously without the aid of expensive artificial lighting. In the early days whole film companies were transported to the supposed scene of the action, even when the scene was laid in a foreign country; after the outbreak of the World War, however, this practice was abandoned, and remote scenes came to be represented as nearly as possible by the aid of the carpenter and scene-painter. A thousand workmen would sometimes be employed to construct a single sham village, while theatrical agencies were developed to supply almost every variety of foreign "type" that the imagination of the scenario writer or the exigencies of production could demand. Nothing better illustrates the illiteracy that still clung to certain phases of the business than the absurdities and anachronisms which these made-to-order settings not infrequently disclosed; as, for example, that widely exhibited picture in which the great pyramid appeared with certain improvements that Cheops had neglected to provide, notably a very convenient stairway rising to the top.

An early discovery was that the film would lend itself to a great variety of tricks. A typical example very common in "slapstick" comedy, was that in which a man, caught under the wheels of a steam roller, is merely flattened out by the experience, and by means of a seeming piece of legerdemain is restored to his normal shape. It is hardly necessary to explain that in taking such a picture the camera is stopped at the appropriate moment and a dummy substituted as the victim of the steam roller. Another artifice introduces at the proper juncture certain ghost-like figures which hover in uncanny fashion about the scene, or still more uncannily, perhaps, shows us an actor apparently shaking hands with himself. In each case the effect is produced by taking two pictures on the same film (or sometimes by printing two negatives on the same positive). It is an artifice which was sometimes employed by actors to play two important rôles in the same scene; an actress, for example, would appear as both mother and daughter. The most successful of such pictures, however, scarcely ever rose above the level of an interesting *tour de force*. Other peculiar effects were produced by increasing or decreasing the speed with which the film is normally run through the camera. Increasing the speed in the camera reduces the relative rate of projection; this has the effect of separating each motion of an object into its component parts, and the result is not only interesting in itself but valuable for scientific and educational purposes. The wing movements of a bird, for instance, can be examined in a manner that would otherwise be impossible. By the reverse method, the opening of a flower can be presented continuously within a few minutes, though the separate pictures may have been taken at the rate of one an hour over a period of days or weeks. By the use of magnifying lenses minute organisms could be photographed; and similarly, by employing telephoto lenses, motion-pictures showing various heavenly bodies could be obtained. In farcical or melodramatic films the ability to increase relative speed was employed to make various "stunts" involving horses, railway trains and automobiles seem more dangerous than they really were. Another illusion often used for the same purpose is that obtained by projecting the film backward. By this means a man is made to seem to jump to the top of a building or to defy the law of gravitation in some equally astonishing manner. It is a trick also employed in those pictures in which knives are apparently thrown with such skill that they almost, but do not quite, strike a person standing against a wall; the scene actually photographed is one in which the knives are being withdrawn from the wall by fine, black threads. For a few years these artifices were in great vogue, but they presently grew tiresome, especially after audiences learned that they were frequently victimized by elaborate pieces of deception. One result was to discount nearly every scene in which an actor performed a seemingly hazardous feat; audiences refused to be thrilled, and such "stunts," fortunately for the artistic advance of the moving-picture, fell somewhat into disrepute. Nevertheless there were film companies which continued to exploit devices of this kind, and a special class of performers, known as "hazard people," was employed.

The possibilities of the animated cartoon were first suggested by the well-known illusion in which chairs and other objects are made to seem to move of their own volition. This illusion was effected by stopping the camera while the position of the object was actually being shifted. The animated cartoon is achieved somewhat similarly by photographing a series of drawings, each showing a slight advance over the other. In the earliest examples as many as 8,000 separate drawings were made for each 500 ft. of film, and the process, as thus evolved, was extremely slow and laborious. Later methods were developed whereby only moving parts of the picture were redrawn, and in this way the number of drawings could be reduced to less than one thousand. Even with this simplification a staff of artists was required to complete an animated drawing or cartoon, and the artist to whom it was attributed rarely did more than furnish the outline of the story or a few preliminary sketches. The method employed in making animated cartoons was soon adapted to other subjects; it was found of particular value in illustrating new inventions, or in depicting the operation of certain kinds of mechanism too intricate to be easily photographed from original models.

Early pictures purporting to be taken under the sea were actually photographed through the side of a glass tank. In 1913, however, the so-called submarine tube, which had been devised to lower beneath a boat for observation purposes, was adapted for cinema photography, and the first actual submarine pictures were taken. By this means the under-sea scenes of Jules Verne's *Twenty Thousand Leagues Under the Sea* were filmed, and later some remarkable pictures were made of divers fighting with sharks. Interesting cinema views were also obtained of many varieties of ocean fish and submarine plant life.

Educational Use.—With the development of cinema technique it came to be seen that the moving-picture might be used as a valuable aid to education. The hopes of many people that the commercialized cinema would undertake this work on a large scale were of course not realized. Nevertheless, in most cinema theatres it became customary to exhibit excellent pictures of current events, travel, or similar subjects in addition to the regular programme; and the educational value of such pictures should not be overlooked. The British Cinema Commission of Inquiry found that, other conditions being equal, the fund of general knowledge possessed by children who frequent the pictures is far wider and far richer than that possessed by those who do not. This information covered a wide range, including facts of geography, literature, natural science, industrial processes, social life, current events, etc. Moreover, the ideas formed from a moving-picture were often demonstrably more accurate than those which the children had previously acquired from an oral or printed description.

It is obvious that, wherever the intention is to impart information which is concerned primarily with visual impressions, the motion-picture is greatly superior to any other form of instruction. Words are only an inadequate substitute for pictures in giving correct ideas of landscape, natural or mechanical processes, foreign customs and the like. For this reason, ten minutes in a motion-picture theatre will often give a better grasp of such subjects than several hours devoted to text-books. Knowledge acquired in this way has a vividness and an interest that do not attach to other forms of instruction; consequently it is acquired with less mental friction and with less

likelihood of its being forgotten. During the World War, the Governments engaged in that conflict produced thousands of war pictures to encourage enlistment and keep up morale; and the cinema proved itself to be one of the most potent methods of propaganda in reaching the mass of the people. Films taken on the battle-field, moreover, will acquire more and more historic interest as time goes on. Such pictures, displayed in connexion with the course of study at military colleges, have a value above mere entertainment. Practically all Governments, therefore, provided special archives for preserving motion-picture films, especially those dealing with military subjects. The taking of pictures of current events was developed as a special branch of the motion-picture industry. Certain companies perfected organizations with cameramen acting as their representatives all over the world, and facilities were provided for the rapid transportation and development of news films. These companies began to compete to get their pictures into the theatres at the first possible moment, and motion-pictures of important events were frequently exhibited within an hour or two after the event had taken place. Sometimes pictures showing earlier phases of a prize fight, an inaugural ceremony or occurrence of like nature were displayed even while the event itself was still in progress.

The U.S. Government was probably the first to use the cinematograph for the purpose of disseminating agricultural information among farmers. In 1920 the Department of Agriculture had in circulation approximately 100 cinema pictures showing such subjects as *How to Select a Laying Hen* and *The Story of Cotton.* The films were produced under Government supervision and developed in Government laboratories, which then had a capacity of one reel a week. Towards the close of the decade many private institutions were also undertaking the production of moving-picture films for educational purposes, and the installation of projecting machines in schools and churches was becoming rather general. In 1920 there were in the United States 1,500 schools, universities, and similar institutions so equipped, while more than 2,000 had arrangements with local theatres for the exhibition of pictures of special value in connexion with educational work. About 2,000 churches occasionally showed moving-pictures either at the church proper or at some outside place under church supervision. In order to supply schools and churches the "film library," devoted largely to educational subjects, was developed and gave promise of serving a need analogous to that supplied by the circulating library of books. These libraries were at first instituted as commercial enterprises, but in the United States in 1920 there was at least one organization which supplied films gratis to institutions that offered to exhibit them free of charge.

Censorship and Regulation.—A demand for the regulation, supervision and censorship of the cinema theatre arose very soon after the film began to be used for narrative and dramatic purposes. Regulation was first concerned with construction of the theatre, the elimination of the fire hazard, and the supervision of audiences; then it came to be felt that the chief danger lay in the pictures themselves. Social workers in nearly every country conducted an agitation for a censorship that would prevent the showing of objectionable pictures.

One of the first countries to establish a national censorship was Sweden (1911); other countries soon followed—Spain (1912), Italy (1913–4), France (1916). Censorship was also instituted in Russia and Japan; in the latter country the prohibitions included anything that "contradicts morality and consequently the principle that good brings its own reward and evil its own punishment."

In Great Britain, the Cinematograph Act of 1909 provided for the licensing of cinema theatres but not for censorship. As a result, however, of the discussion incident to the importation, chiefly from France and America, of certain objectionable films, the Cinematograph Exhibitors' Assn., with the approval of the Home Secretary, established an independent Board of Film Censors. Exhibitors were not of course obliged to accept the decisions of this Board, yet before the close of the decade 1910–20 more than 97% of the films exhibited in the British Isles were first reviewed by the Board of Censors.

In 1920 the Cinematograph Exhibitors' Assn. adopted a resolution providing for the expulsion of any member who refused to submit to the censorship of the Board. It might have been expected that such censorship, in view of its close connexion with the trade itself, would prove careless and ineffective. It was, however, the opinion of the Cinema Commission of Inquiry, which conducted a very careful investigation of the whole subject in 1917, that the work of the Board was for the most part conscientious and commendable. This commission had been instituted by the National Council of Morals, its report, *The Cinema,* already referred to, is a valuable treatise on many aspects of the moving-picture industry. One of its conclusions was the recommendation of a State censorship, largely on the ground that the authority of the State could be exercised more effectively than that of an independent board. Testifying before the commission, T. P. O'Connor, who had been appointed president of the Board of Censors in 1916 (following the death of G. A. Redford, his predecessor), stated that films were censored with respect to a series of prohibitory regulations, 43 in number, of which the following are typical: "Indecorous, ambiguous and irreverent titles and sub-titles. Irreverent treatment of sacred subjects. The *modus operandi* of criminals. Cruelty to young infants and excessive cruelty and torture to adults, especially women. Nude figures; impropriety in dress or conduct. Gruesome murders, strangulation scenes, executions. References to controversial politics. Subjects dealing with the drug habit, white-slave traffic, race suicide, etc. Illicit sexual relationships; suggestive scenes of immorality; incidents suggestive of incestuous relations. Scenes tending to disparage public institutions or characters. Materialization of the conventional figure of Christ."

Besides showing much good sense, these prohibitions indicate to what lengths even a moderate censorship can go; if logically applied such rules would bar many of the plays of Sophocles, Shakespeare and Ibsen.

The British Board of Censors exercised no control outside of the British Isles. In Canada in 1920 each province had a board of censors appointed by the lieutenant-governor in council; in general the censorship was very rigid, but the fact that a film had been approved by the authorities of Ontario, for example, was no guarantee that it would be passed by the board in Quebec, or vice versa. Elaborate regulations for censorship were adopted by New Zealand in 1916, and in 1920 State censorship of films existed in many parts of the British Empire, including India and New South Wales.

In the United States, a non-official censorship, subsequently known as the National Board of Review, was instituted in 1909 by the People's Institute of New York. Its review committee (unpaid) was in 1920 composed of 140 representative citizens, many of whom were engaged in social welfare work. The American Board, unlike its British counterpart, had no direct connexion with the cinema industry; its revenues were derived in part from contributions and in part from a flat charge of $6.25 (1920) per reel which was assessed against the producer for the review of his pictures. In 1920 nearly 6,000 reels were so reviewed, representing, it is said, more than 90% of the films exhibited in the United States. The censorship exercised by the American Board was on the whole noteworthy for its enlightened character, but while the Board won support in many communities, there were others which seemed to think its supervision was either too lenient or not suited to local needs. By 1921 six states—Ohio, Pennsylvania, Maryland, Kansas, New York and Massachusetts—had established official censorship boards, and agitation for similar laws was in progress in many other states. Certain groups were also advocating a national board of censors to be appointed by the president. National laws to 1921 consisted only of general prohibitions against the shipment of improper films in interstate commerce, though in 1918 the Secretary of the Treasury was empowered to censor imported films.

For the most part, the cinema industry strongly opposed the extension of laws for official censorship of motion-pictures, and the objections put forward were often well founded. For people of the Anglo-Saxon tradition it is hard to justify the establishment of a bureaucratic control over any form of artistic or intellectual expression, whether the medium be the press or the stage. It should be said, moreover, that opposition to censorship by no means involves a covert desire for licentious pictures; even without censorship the exhibitor is fully responsible for the films he shows. Legalized censorship removes the opportunity to show improper films; it is

preventive. Its great danger is that it may become rigid and arbitrary. Special reasons, however, were advanced why in the case of the moving-picture preventive action should be taken. One of these was that the cinema theatre makes an extraordinary appeal to children, who comprise a large percentage of the average neighbourhood audience. But it could be answered that if the cinema was ever to become a mature art, it could not forever be restricted by standards of what might and might not be good for children. The best solution here seemed to lie in providing special performances for children; no good reason appeared why children should be encouraged or even permitted indiscriminately to attend the cinema theatre. A better plea for censorship was that the industry, having arisen in less than a quarter of a century, was still in a formative condition, without adequate artistic and moral standards. It was urged, therefore, that censorship was necessary not only to protect the public but to protect the producer against his inability to perceive his own best interests. Such an argument clearly anticipated a period when censorship would be unnecessary; unfortunately experience points to the difficulty of abolishing any kind of bureaucratic agency when once it has become established. The continued existence of the British dramatic censorship, despite very great efforts to modify its powers, affords an excellent illustration of the tenacity of Government bureaus. It should be noted also that in the United States the censorship laws seemed to be designed partly as revenue measures, which of course still further entrenched them against attack. For these reasons the voluntary censorship undertaken by the Board of Film Censors in England and the National Board of Review in the United States would on the whole seem preferable to other methods of preventive supervision. In this connexion the following excerpt from the official statement of the American Board is significant: "The National Board's standards are, of course, progressive and will change with the lapse of time . . . becoming more ideal as the motion-picture in America emerges from its present condition as a new art. Moreover, the increased experience of the producers, the development of motion-picture artists, the classification of the theatres, the influence of more cultivated audiences, and the popular adoption of motion-pictures into education, all of which is even now in progress, will in time bring about conditions so different from the present that regulation may perhaps not be necessary."

Artistic Value.—The close of the decade was marked by various controversies as to whether the cinema could be classified as an art. That discussion was in itself a valuable indication of the improving status of the moving-picture; ten years earlier the cinema was either ridiculed or ignored. Later critics very naturally sought to establish their case against the cinema on the obvious fact that a majority of the films were crude and childish, mostly slapstick farce and sentimental melodrama; but an argument evolved in this fashion has little to commend it; doubtless in the England of the 15th century it seemed equally impossible that the crude mystery and morality plays of the day should ever give rise to distinguished art. Yet these crude efforts were the precursors of the drama of Marlowe, of Jonson and of Shakespeare. This is not to say that friends of the cinema are looking forward to a Shakespeare of the films; the artistic values that can be achieved in the motion-picture are not commensurable with those which pertain to the written drama. What is contended is that, considered solely as a method of telling a story, the motion-picture is capable of achieving highly artistic results. Even sentimental melodrama as produced in the cinema became a more artistic type of narrative than the old popular melodrama of the stage. But the best producers were not content to have made only this degree of progress, and their finest achievements at least foreshadowed the development of singularly beautiful and expressive art.

Action and setting constitute the chief means of this art, and in both elements it has advantages over the older forms of narrative. The cinema can present action more successfully than the novel and hardly less effectively than the drama. In the ease with which it can represent and control the element of setting it has an immense superiority over both the novel and drama, though its possibilities in this direction were only beginning to be appreciated. Some writers, notably Prof. Hugo Münsterberg in his interesting study, *The Photoplay* (1916), insist that the essence of the new art lies in its ability to triumph over the ordinary limitations of mundane existence. "The photoplay," says Münsterberg, "tells us the human story by overcoming the forms of the outer world, namely, space, time and causality, and by adjusting the events to the forms of the inner world, namely attention, memory, imagination and emotion." The plasticity of the motion-picture medium, its freedom from merely conventional restrictions of time and space, undoubtedly give fresh scope to the imagination and the power to weave new patterns out of the materials of existence. Possessing these advantages, the cinema lacks the means to tell any appreciable part of its story in words. Failure to appreciate the artistic possibilities of the moving-picture often arose from a failure to perceive that it must be regarded as an art quite different in method, if not in purpose, from that of essentially literary forms, particularly the spoken drama. It is not a literary art. It cannot rely on literary methods. This explains the lack of success that attended the efforts of many literary men, novelists and dramatists, to use this new medium. Its central purpose, namely to arouse emotion, is identical with that of the spoken drama; it is perhaps more amenable to fundamental laws of dramatic composition than many producers and directors seemed to realize. But in most respects it differs more widely from the accepted dramatic form than Shakespeare differs from Sophocles or Ibsen from both. In virtually surrendering dialogue, the motion-picture surrenders a form of expression upon which the dramatist relies very largely for the presentation of character and the clash of character; it follows that a scene representing mental conflict, for example, must either be inadequately represented in the moving-picture or expressed in a different way.

For this reason, the production of a successful motion-picture play makes the very highest demand on the skill and imagination of the scenario writer, the director, and the actor. In the composition of the story every scene and every element of the scene must possess an expressiveness which is quite unnecessary where words can be used to cover defects of action or setting. The art of suggestion must be pushed far beyond the conventional limits of the legitimate stage; an attitude, a look, a gesture, a bit of pantomime must be made to tell as much as pages of dialogue. There is no reason to disparage such a method; in ordinary life we discern the nuances of character quite as much from facial expression as from what we are told by the person himself; the light in the eye often illuminates the mind better than the spoken word. Setting, also, may be made to reflect character; it may show the world as the protagonist of the drama himself sees it, sometimes twisted and distorted, sometimes fair and alluring. Here at least is an opportunity to do what the legitimate drama could never do. Setting likewise may advance the plot; as Otis Skinner points out, sometimes a glove, a pistol, an empty chair, will tell a better story than action. To a much greater extent than the drama, the successful motion-picture requires the coördination of the efforts of the author, the actor and the producer: a play may have an existence of its own without ever having been produced on the stage, but a moving-picture scenario is the barest of skeletons before it is acted in front of a camera. The photoplay is thus a composite art, almost equally dependent on its various elements. Some advance had been made in the decade 1910-20 in achieving a successful coördination of these elements, but no completely adequate method or procedure for securing this result had been evolved, so that good acting was frequently wasted on ridiculous scenarios, while good stories were made childish by incompetent direction.

Film Actors.—In an art so new, it is not surprising that the greatest reputations were made by actors whose appeal to the public is less a matter of circumstance than that of the scenario writer or the director. By reason of the extensive popularity of the motion-picture the names of Mary Pickford, Douglas Fairbanks, and Charles Chaplin had a renown that was no less than world-wide. Miss Pickford (family name Smith) was born in Toronto, Can., April 8 1893, the daughter of a character actress. She made her début on the stage at the age of five, but her first marked success was in motion-pictures, and she afterwards appeared as leading woman in many highly successful photoplays, among them *Tess of the Storm Country*, *Cinderella*, *Fanchon the Cricket*, *Rebecca of Sunnybrook Farm*, etc. For many she typified the charm of innocent girlhood. On March 28 1920 she married Douglas Fairbanks. She was in 1920 head of the Mary Pickford Film Company. Fairbanks, who was born May 23 1883 in Denver, Col., attended for a time the Colorado School of Mines. He appeared in a minor rôle on the New York stage in 1901; later he was "starred" in several comedies and musical pieces, after which he left the stage for motion-pictures, where his engaging smile and athletic prowess stood him in

good stead. In 1916 Fairbanks organized his own producing company. At the age of seven Charles Spencer Chaplin (born in 1888 near London) first appeared on the London vaudeville stage. A piece called *A Night in an English Music Hall* brought him to the United States, and in 1914 he became a cinema actor for the Keystone Film Co., under whose auspices he quickly showed his genius for comedy, though his early rôles were principally those of the inebriate clown, borrowed or imitated from the vaudeville stage. In succeeding years he performed in motion-pictures for the Essanay Co., the Mutual Film Corp., and the First National Exhibitors' Circuit; it is stated that in 1917 he received $1,000,000 from the last-named organization for making eight two-reel pictures. He afterwards constructed a motion-picture plant at Los Angeles and undertook the direction of his own pictures.

Before the invention of the motion-picture the art of acting was perhaps the most ephemeral of the arts. We have been told that David Garrick, for example, was a great actor, but we have no means of judging for ourselves. The motion-picture can now give to the actor's art a permanence that is to some degree analogous to that of the printed book. Up to 1921 it was, however, a more conditional permanence, for the reason that cinema film as then manufactured had much less enduring quality than the printed page; a book can be preserved for centuries, but the commercial film of the day was not expected to remain clear for more than 15 years. Films kept longer than that showed signs of rapid disintegration. A continual renewal of old films by making new copies was therefore the price of keeping a permanent motion-picture record. Many old films were accordingly allowed to lapse, and it is obvious that accident will play a large part in determining what films shall be preserved as the years go by. But with good fortune, some motion-pictures may achieve an immortality comparable with that of the great works of arts or letters. It would be more than hazardous to say that the cinema, in the brief period of its existence, had yet produced any picture which deserved immortality. Still, every one who is interested in this new art would wish to make a few exceptions, if only for the sake of their historical importance.

(H. Cr.)

CITY GOVERNMENT (United States).—Lord Bryce's *American Commonwealth* (1888) may be said to mark the turning point in the consideration of city problems in America. From the end of the Civil War in 1865 to 1888 the United States was engrossed in problems of readjustment, reconstruction, transportation and internal development. Municipal affairs, where not wholly neglected, were at low ebb and in the hands of selfish political organizations, whose interests were wholly those of personal aggrandizement and profit. Lord Bryce's criticism stung the country into consciousness of the shortcomings.

A national conference on city government was held in Philadelphia in 1894, out of which grew the National Municipal League. Its early meetings were devoted to a statement of conditions and to a discussion of the lessons they taught. Publicists and students were not in a position to agree upon a statement of belief, mainly because they had not given to general plans the necessary attention and study; their experience had been purely local. There was no regular form of American municipal government, and the greatest diversity of types, although the general tendency was toward a federal plan modelled on that of the national Government with a division of functions (legislative, administrative and judicial). Out of the League's efforts grew a "municipal programme" the fundamental features of which were that every community should have the right of self-government in local affairs without the interference of outside governmental or party machinery; that the city's public property in land, and especially its franchise rights, should be preserved unimpaired; that all barriers should be removed which prevented the popular will from expressing itself freely and effectively; that municipal administration should be conducted in the main by a class of public servants who by reason of experience and special training were particularly fitted for their official duties; that official responsibility should be so placed, through simplification of governmental machinery and full publicity of accounts, that the people could hold their public servants to the execution of the public will with the least possible delay and uncertainty.

In the year in which this programme was adopted (1900) the Galveston flood nearly destroyed that city. Among other things swept away was the typical old-style mayor and council form of government, which was replaced by a commission of five men appointed by the governor of Texas. This commission worked so swiftly and efficiently, and with so much less annual cost, that, after the emergency passed, an attempt was made to continue it with a commission of five members, three appointed by the governor and two chosen by popular vote. A court decision declared such appointments to be unconstitutional and the entire commission forthwith became elective. To the surprise of many observers, no demoralization ensued, and through successive elections the changes in the personnel were slight.

In 1908 Des Moines adopted the Galveston plan, with the addition of the initiative, referendum, recall and non-partisan primary. This broader plan was widely copied, and 481 cities and towns of 2,000 and over by Jan. 1 1921 had adopted it.

The following cities of more than 50,000 inhabitants (census of 1920) were in 1921 operating under this form: Buffalo, N. Y.; Dallas, Tex.; Erie, Harrisburg, Wilkesbarre, York, Lancaster, McKeesport and Reading, Pa.; Jacksonville, Fla.; Kansas City, Kan.; Lawrence and Lynn, Mass.; Newark, N. J.; New Orleans, La.; Portland, Ore.; St. Joseph, Mo.; St. Paul, Minn.; Salt Lake City, Utah; Seattle, Spokane and Tacoma, Wash. There were in the same year 56 cities and towns in Illinois under commission government; Texas followed with 48; Kansas had 42; New Jersey 38; Pennsylvania 32; Oklahoma 23; California 17; Michigan 17; South Dakota 16; Alabama 13; Louisiana 13; Tennessee 13; Florida 12; Iowa, Missouri, North Dakota and Washington 10 each. The number per state gradually decreased until in Arizona, Connecticut, Maine, Maryland and New Mexico there was one each. There was none in New Hampshire, Vermont, Rhode Island, Delaware, Virginia, Georgia, Indiana, Arkansas, Wyoming, and Nevada.

Few changes of importance were made in the Des Moines model for several years after 1908 (except the preferential ballot first added by Grand Junction, Colo., 1909) until the appearance in 1913 of the first modification providing for a city manager. Out of this grew a city-manager form of commission government, which the National Municipal League recommended to charter-makers, then multiplying in great numbers due to the growing dissatisfaction with existing conditions. A second "municipal programme" formally adopted by the National Municipal League in 1914, definitely embodied the city-manager plan and later recommended that the council or legislative body be elected on the principle of proportional representation.

The city-manager movement is justly regarded as the best fruit of the movement for better municipal government. It embodies the short ballot, responsiveness to public opinion, concentration of executive power and responsibility, expert administration of city affairs, and elimination of legislative control over the administrative, all essential principles of sound governmental practice. The success of the plan has been abundantly proved, although here and there expectations, because unreasonable, have not been met. Like other governmental agencies it is open to change and improvement, but it stands as the big contribution to political science of the past quarter of a century. Moreover, its application to an increasing number of cities is developing municipal policies as perhaps no other single factor does. City-planning, zoning, budget-making, the preparation of adequate and carefully devised plans for transportation, intelligent housing, have all been stimulated by the introduction of experts in municipal affairs.

On Jan. 1 1920 there were 203 cities, according to the City Manager Association roll, operating in this form; Michigan leading with 27 cities; California, Texas and Virginia following with 19 each; Iowa and Ohio 12; North Carolina 9; Florida 8; New York 6; Pennsylvania and Georgia 5. There was none in New Hampshire, Rhode Island, Delaware, Indiana, Illinois, Wisconsin, North Dakota, Nebraska, Alabama, Mississippi, Montana, Wyoming, Nevada, Idaho, Washington. The following cities with a pop. of 25,000 or more (census of 1920) were in 1921 administered by city managers: Alameda, Pasadena, Sacramento, San Diego and San José in California; Colorado Springs, Colo.; Tampa, Fla.; Dubuque, Ia.; Waltham, Mass.; Bay City, Grand Rapids, Kalamazoo, Muskegon and Pontiac, Mich.; Niagara Falls and Watertown, N. Y.; Akron, Ashtabula, Dayton, Lima and Springfield, O.; Muskogee, Okla; Altoona, Pa.; Beaumont, Tex.; Lynchburg, Newport News, Norfolk, Peterburg, Portsmouth, and Roanoke, Va.; and in West Virginia, Charleston and Wheeling.

Home rule for cities, a far cry when Lord Bryce's book appeared, was in 1921 the guaranteed constitutional right of the cities of one-quarter of the states in the Union and bade fair to become the policy of many more. It represented a great gain both for municipal government and for an efficient administration of state affairs. Improvements in the personnel of city officials have not kept pace with improvements in other directions, although substantial changes for the better are everywhere to be noted. There can be no lasting improvement in this connexion until the short ballot becomes an established fact. This change will come less quickly than the others because of the "vested interests" of the great political organizations, which will yield with the greatest reluctance, for the short ballot means the substitution of citizen management for party organization. Whether the latter would ever cease to be necessary was still in 1921 a question upon which there was a sharp difference of opinion. There is no doubt, however, that party ties, particularly in local contests, are far looser than they formerly were. "Municipal affairs" was in 1921 a phrase which included a multitude of things that a generation earlier were not discussed even academically. One has only to study the budget of the present-day American city to appreciate how manifold those affairs have become. Not only numerically but intrinsically they have grown in importance and this constitutes an important feature of the present public interest in them. The municipal activities of American cities are numerous and varied. Prof. Frank Parsons, in summing them up, declared that the following subjects were held to be proper public purposes and proper subjects of municipal ownership and control: "Roads, bridges, sidewalks, sewers, ferries, markets, scales, wharves, canals, parks, baths, schools, libraries, museums. hospitals, lodging houses, poor houses, police, jails, cemeteries, prevention of fire, supply of water, gas, electricity, heat, power, transportation, telegraph and telephone service, clocks, skating rinks, musical entertainments, exhibitions of fireworks, tobacco warehouses, employment offices." The three decades following 1890 witnessed a steady growth toward responsible, efficient democratic government among American cities. (C. R. W.)

CLARETIE, JULES ARSÈNE ARNAUD (1840–1913), French man of letters (*see* 6.436*), retired from the administration of the Théâtre Français in 1913. *La Vie de Paris* was completed in 1913, and published in 21 vols. in 1914. He died in Paris Dec. 23 1913.

CLARK, CHAMP (1850–1921), American politician, was born in Anderson co., Ky., March 7 1850. He first entered Kentucky University but finished his course at Bethany College in 1873. The following year he was elected president of Marshall College, West Virginia, and one year later was admitted to the bar. After 1880 his law office was in Bowling Green, Missouri. He was city attorney for Louisiana (Mo.) and Bowling Green from 1878 to 1881, was prosecuting attorney for Pike co. 1885–9, and then for three years was a member of the Missouri House of Representatives. He was a member of Congress from 1893 to 1895, and from 1910 to 1921, being Speaker from 1911 to 1919 and minority leader thereafter; he was defeated in the election of 1920. At the Democratic Convention for the nomination of a presidential candidate held at Baltimore in 1912, he led on 27 ballots, and had a clear majority on eight, but he was finally defeated by Woodrow Wilson of New Jersey. He died in Washington, D.C., March 2 1921.

CLARKE, ALEXANDER ROSS (1828–1914), British soldier, was born Dec. 16 1828. He entered the Royal Engineers, and in 1854 was placed in charge of the trigonometrical operations of the ordnance survey. He retained this position until 1881. He was one of the British representatives at the international geodetic congress held in Rome in 1883, and in 1887 received the Royal medal of the Royal Society. Colonel Clarke was a recognized authority on geodesy, and made valuable contributions to the subject. He died at Reigate Feb. 11 1914.

CLARKE, SIR CASPAR PURDON (1846–1911), English art expert, was born in London Dec. 21 1846. Educated privately at Sydenham and Boulogne. In 1862 he entered the art schools at South Kensington and was trained as an architect. In 1865 he entered the Office of Works, and in 1867 was attached to the works department of the South Kensington museum. He travelled extensively for the museum, purchasing objects of art, and at the same time carried on his profession as an architect. In 1883 he became keeper of the India museum at South Kensington, in 1892 keeper of the art collections at South Kensington, in 1893 assistant-director, and in 1896 director. This post he held until 1905, when he became director of the Metropolitan museum, New York, resigning in 1910. He was knighted in 1902. He died in London March 29 1911.

CLARKE, SIR EDWARD GEORGE (1841–), English lawyer and politician (*see* 6.444), retired from the bar in 1914. He published in 1918 an autobiography, *The Story of my Life.*

CLAUSEN, GEORGE (1852–), English painter (*see* 6.467). His recent work has been chiefly landscapes, such as "The Fields in June" (1914), now in the Cardiff gallery, and "Midsummer Dawn" (1921), but has also included portraits and figure work such as "The Window" (1912), now in Cape Town gallery. For the Imperial War museum he painted the large "Gun Factory at Woolwich Arsenal" (1919), broadly decorative but very refined in handling. His decorative work also includes "Renaissance" (1915) and decorations for the Hall at High Royd, Huddersfield, consisting of life-size figures in lunettes. He was elected R.A. in 1908, and is a member of the R.W.S. He is represented in the Tate gallery by "The Girl at the Gate" (1890) and "The Gleaners Returning" (1908).

CLEMENCEAU, GEORGES EUGÈNE BENJAMIN (1841–), French statesman (*see* 6.482). When Clemenceau resigned the French premiership in July 1909, he had already played as great a part in his country's history as would have satisfied the energies and ambitions of most men. He might be driven from office; nothing could force him to give up the fearless use of his critical gifts as a speaker and as a writer. Out of office he remained a formidable figure. As a senator he did his utmost to defeat Raymond Poincaré in the presidential election of 1913, and rallied against him all the forces of French radicalism. Clemenceau's candidate, Jules Pams, was adopted by the party caucus, but, in spite of Clemenceau, Poincaré maintained his candidature at Versailles and was elected. There were many then who felt that at last "the Tiger" had been killed. On the boulevards, young students who, years afterwards, were to seek from Clemenceau all their hope and inspiration, paraded shouting "Down with Clemenceau!" The old fighter refused to accept this defeat. He founded *l'Homme Libre*, in which to carry on his warfare against Poincaré. Every morning he poured a column of acid upon the new President of the republic, but soon found himself forced by patriotic honesty to support with all his strength the chief measure introduced to Parliament during the first year of Poincaré's term of office - the Three Years' Military Service bill. He belonged to the generation of defeat, and, while in no way a *revanchard*, believed, in spite of his cynicism, that injustice cannot be permanent, and therefore desired to see his country strong. He, more than any other Frenchman, had studied and appreciated the meaning of German military preparations, and to him also belongs the honour of having been calmly consistent in warning France of what was to come and exhorting her to gird up her loins. He fought for the Three Years' Service bill with every weapon in his armoury, and it was he who opened the eyes of many Radical opponents of the measure to the danger of allowing considerations arising from the approaching elections to cloud their judgment on a matter of life or death to the country.

On the very eve of the World War in July 1914, speaking in the Senate, he insisted upon steps being taken to press forward at top speed the realization of the artillery programme. His war writings began long before war was declared, and there are some worthy of a place in history. Among them were the articles published by *l'Homme Libre* under the splendid titles of "Vouloir ou Mourir," "Pour Être," "Triompher ou Perir." After the outbreak of hostilities he soon made acquaintance with the stupidity of rigorous censorship, and in Sept. 1914 his paper

***These figures indicate the volume and page number of the previous article.**

was suppressed on account of a violent attack upon the appalling inefficiency of army medical services. With characteristic irony and decision two days later he issued *l'Homme Enchaîné*, a title which was kept until he himself took office on Nov. 16 1917. Each day the censorship had to forge fresh fetters for chaining him. With all the skill of a surgeon Clemenceau laid bare the faults which too frequently characterized French war-leading. Poincaré was the butt for many of his bitterest jibes, and by the savagery of his opinion Clemenceau perhaps shut himself out of office for so long a time. He fought government after government in his paper, but there the censorship put buttons on his foils. His voice, however, could not be stilled in the private proceedings of the Senate. At the beginning of the war he was president of the foreign affairs committee, and when de Freycinet joined the Briand Ministry he also was elected president of the army committee of the Upper Chamber. These two posts gave him an observation post commanding the whole field of war affairs, and his criticisms and suggestions on these committees were invaluable. M. Caillaux, in his defence, *Mes Prisons*, states that throughout the war two policies fought in France for supremacy—his own tendency towards reconciliation with Germany, and peace without victory, to be made very largely at the expense of Great Britain; and the uncompromising faith of Clemenceau that France must fight to a finish, that it would be better for the world and for France that she should go down into dust rather than she should live in dishonourable partnership with injustice. Caillaux's analysis is right in its main perspective, and he is also correct in stating that it was in the spring of 1917 that Clemenceau won his victory. Then it was, without a doubt, that the clear revelation of the results of the doctrine of defeatism startled the people from the war-weariness into which they were slipping.

It was upon the wave of feeling then created that Clemenceau came into power. He had to fight not only Caillaux and his henchmen, who knew that with Clemenceau at the head of affairs their shrift would be short; he also had arrayed against him a legion of self-made enemies and the instinctive distrust of mediocre politicians for a man they knew to be their master. By July 1917, Clemenceau had driven Malvy from office by his charges of negligence in dealing with enemy propaganda. The position of the whole Ribot Ministry was made untenable, and the Painlevé Government was the last barrier erected against Clemenceau. On Nov. 16 1917, he formed his Victory Cabinet. Nearly all the men in it were unknown, and Clemenceau could well have said: "Le Gouvernement, c'est moi."

The story of his ministry is told under FRANCE (*History*). A few facts and dates complete the record. He presided over the Paris Peace Conference, at which he was chief French delegate. On Feb. 19 1919 he was wounded by revolver shots fired at him as he was leaving his house in the rue Franklin, by a young anarchist, Emile Cottin (sentence of death, March 14, commuted to imprisonment for life). He allowed himself to be put forward as candidate for the presidency at the preliminary party caucus meeting on Jan. 16 1920, but, in view of the support given to M. Deschanel, he did not stand for election at the National Assembly of Versailles, and then retired from all public activity. He afterwards traveled in Egypt and India. In June 1921 he was given a doctor's degree at Oxford University.

CLERK, SIR DUGALD (1854–), Scottish civil engineer, was born at Glasgow March 31 1854. He was educated at the West of Scotland Technical College and the Andersonian College. He invented the Clerk cycle gas engine in 1877, improving it in 1878 (*see* 11.408), and became a recognized authority on internal combustion engines. He also interested himself in motor engineering, acting as judge at the automobile trials at Richmond in 1899 and 1900, and in 1908 becoming president of the Incorporated Institution of Automobile Engineers. During the World War he became director of engineering research to the Admiralty, and until 1919 was a member of the advisory committee for aeronautics to the Air Ministry, and also of the air inventions committee. In 1908 he was elected F.R.S. He was knighted in 1917 in recognition of his work.

CLEVELAND (*see* 6.503), the largest city in Ohio and the fifth in the United States, had in 1920 a pop. of 796,841, a gain of 236,178 or 42·1% for the decade. The area in 1921 was 56·655 sq.m. as against 41 sq.m. in 1910. To the two viaducts across the valley of the Cuyahoga river were added three others, of which the most noteworthy is the High Level bridge, connecting Superior avenue on the east with Detroit avenue on the west. Its central span is 591 ft. long and 96 ft. above water, permitting the tallest masts of lake shipping to pass. The total length, with approaches, is 5,630 ft. and its cost was $5,407,000.

The centre of retail trade moved steadily eastward, crowding out the large houses with spacious grounds which had made Euclid avenue famous. New residential sections were developed, especially near Wade park and on the heights east of the city. Noteworthy additions were made to Cleveland architecture in the county court house and the city hall (of the uncompleted "Group" plan); in office buildings like the Engineers, the Illuminating, the Leader-News, and the Hanna buildings; in the "Plain Dealer" newspaper building; in the Cleveland Trust Co.'s bank building; in the Museum of Art; and in churches, the Church of the Covenant (Presbyterian), St. Agnes (Catholic), Euclid Avenue Temple (Jewish), and the Amasa Stone memorial chapel of Adelbert College.

The schools were reorganized in 1917 as a result of a "survey." Significant features were the development of junior high schools, of which there were in 1921 sixteen, and the effective establishment of departmental supervision to coordinate, standardize, and improve the work in each study. The cost of instruction in 1919 was $4,383,-924. The Normal school, now the Cleveland school of education, was affiliated with Western Reserve University. To the university were added schools of pharmacy and of applied social science, and a department of religious education. In 1920–1 the university had 243 instructors and 2,027 students. Of other institutions of higher education, Case school of applied science had 67 instructors and 690 students, St. Ignatius College 26 instructors and 560 students, the Cleveland school of art 17 instructors and 547 students. The most important addition to the educational and artistic life of the community was the Museum of Art, located in Wade park. The building, of beautiful classical design, and admirably adapted to its uses, was completed in 1916. By reason of collections already made and additional gifts, the museum at once took high rank. Its directors have sought through classes, lectures, and special exhibitions, to make it a power in popular education and to coordinate its work with that of the schools and colleges. The musical development of the city was stimulated by the creation of a symphony orchestra.

In its charities Cleveland has carried far the principle of coöperation, seeking to obviate through a welfare federation the waste in soliciting contributions. In 1919 and 1920 Community Chests were organized, and sums aggregating $4,000,000 and $4,500,000 were subscribed in "drives," to meet the needs of all community activities, not only charities, but also Red Cross, Y.M.C.A. and Y.W.C.A., Knights of Columbus, etc. The Cleveland Foundation was created in 1914, becoming the model for similar institutions in other cities. Its purpose was to enable a competent commission, renewable in part each year, to utilize a portion of funds entrusted to it in inquiries on the best methods of furthering the interests of the community, and, when the funds became large enough, to apply their income directly to schemes of betterment. Under its auspices were conducted in 1916 an educational survey at a cost of $50,000, a survey for a community recreation programme in 1920, and a survey of the administration of justice in 1921.

Cleveland is the seat of a federal reserve bank. Its two largest banks were in 1921 the Union Trust Co., formed that year by the consolidation of several older banks, and the Cleveland Trust Company. In the same year the city still retained its position as the greatest ore market in the world and also led in many steel products.

The increase in automobile production in the decade closing in 1914 was 486%. The total value of all products in 1914 was $352,-531,000 compared with $172,115,101 in 1905. Harbour facilities were developed by the completion of the Government breakwater, 5¼ m. long. Passenger steamship service was transferred to a new 5 ac. pier on the lake front, built at a cost of $500,000.

In accordance with authority conferred by the home-rule amendment of the state constitution, a charter, submitted by a special commission, was accepted by the citizens on July 1 1913. Under its provisions the mayor and the 26 councilmen are the only elected officials. Nominated by petition, all candidates appear on tickets without party designation. Heads of departments and divisions are appointed by the mayor; all other officials are appointed according to the merit system.

The city added to its waterworks a filtration plant, with a total capacity of 150,000 gal. a day. Water is drawn through tunnels from a submerged crib about 5 m. from shore.

The total number of men supplied by Cleveland to the U.S. armies in the World War was 55,000; the total amount subscribed in the Liberty and Victory Loans $437,041,300. (H. E. B.)

CLIFFORD, JOHN (1836–), British Nonconformist divine (*see* 6.507), resigned his position at Westbourne Park chapel in 1915. He was president of the National Brotherhood Council from 1916 to 1919.

CLIMATE AND CLIMATOLOGY (*see* 6.509).—In climatological progress during 1910–21 certain general tendencies are observable. (1) Increasing emphasis has been laid upon applied, as distinguished from theoretical, climatology. Practical climatology is essentially human and economic. The investigation of its life-relations is the most important subject with which climatology has to deal. (2) More attention is being paid to the variability, the frequency, and the probability of occurrence of the various climatic elements, with correspondingly less limitation to simple mean or average values. Mathematical treatment of climatic data along well-established lines, such as the use of frequency curves, and of coefficients of correlation, is becoming more general with the result that the whole body of climatological knowledge is more precise and of greater practical value. (3) In most of the recent publications on climatography the fact is recognized that, climate being average weather, no vivid and accurate picture of any climate can be gained merely from a statistical tabulation of the ordinary climatic elements. It is necessary to have also clear and interesting descriptions of the various weather types. The addition of such descriptions has resulted in a distinct gain in the more thorough understanding of climates, especially in their relations to man. For years, one of the most significant sections of *British Rainfall* has been Dr. H. R. Mill's discussion of the occurrence of heavy rainfalls in relation to the actual storm conditions which brought them. Such studies have also recently been carried out in other countries.

The outstanding general text and reference book on all aspects of climatology is the 3rd edition, in three volumes, of Dr. Julius von Hann's *Handbuch der Klimatologie*.[1] These volumes constitute the one indispensable handbook for all who are in any way concerned with the study of climate. The first volume (1908) deals with general climatology. The second (1910) and third (1911) volumes are devoted to climatography. In them, a summary of what is known concerning the climate of every part of the world may be found. The climatic pictures are made notably complete and accurate by means of vivid descriptions of weather types; by frequent reference to the effects of climate upon vegetation, upon crops, and upon human activities, and by well-chosen quotations from the writings of residents and of travellers who are familiar with the climates concerning which they have given accounts. Temperature, rainfall and other essential data for large numbers of stations, in many cases here worked out in detail and summarized for the first time, constitute a very valuable feature of the book. All important literature up to the date of publication of the *Handbuch* is cited. References to more recent literature will be found in the regular meteorological bibliographies.

Classification of Climates.—In the systematic study of the world's climates, some scheme of classification must be employed. Many such classifications have been suggested, some based on a single element of climate and others on various combinations of these elements. The late Dr. A. J. Herbertson, whose "major natural regions" are well known, made a later study of "thermal regions," using certain critical actual temperatures (68°, 50°, 32° F.) and constructing maps which show the numbers of months during which these temperatures prevail.[2]

The duration of these critical temperatures is of importance in the distribution and growth of vegetation, and therefore also in the life of man. A more elaborate scheme of classification has been suggested by Köppen.[3] This is a thorough revision of the classification proposed by him in 1900.

The critical features of the controlling factors are worked out with great accuracy and detail. A brief, simple scheme of two or three reference letters and numbers (climatic formulae) is used for the characterization of each climatic subdivision. As a framework for comparative studies of climates and of climatic controls the new map is of great value.

In studies of the general controls exercised over seasonal weather conditions, and hence also over climates in all parts of the world, the publication of the *Réseau Mondial* is of great significance.[4] This is a compilation of world data by 10° squares of lat. and long., based on observations at land stations averaging two for each square. Monthly and annual summaries of pressure, temperature and precipitation are included, with charts for the year 1911.

Another general publication of broad climatic interest is a study of the snow-line.[5] The snow-line is the resultant of climatic and topographic controls. An analysis of the observations of the snow-line is therefore an important subdivision of climatology. Nearly two-thirds of this monograph is taken up with a detailed summary and a critical examination of the data from all parts of the world, with copious references to the sources of information.

Variations of Climate.—The whole question of climatic variations is still under active debate, both as to the occurrence, characteristics and frequency of any such "changes," and also as to their possible causes. Dr. Ellsworth Huntington has been the most prolific writer on this problem. His investigations, which began in central Asia, have been extended over parts of western Asia, Palestine, the Libyan Desert, the southwestern United States and portions of Central America.[6]

From an examination of a large body of evidence—archaeological, physiographic, historical—including the rings of the giant Sequoias of California, the conclusion is drawn that from the beginnings of human history a gradual change from moister to drier climates has been going on. This process has, however, not been steadily progressive, but has taken place in a more or less irregular pulsatory fashion, drier and moister epochs alternating without definite periodicity as subordinate irregularities on the general curves of desiccation. The major fluctuations are believed by Huntington to have been essentially synchronous, and of the same general character under similar geographic conditions, in central and western Asia, in the Mediterranean area, and in North America. These pulsations are further believed to have been potent factors in bringing about certain great historical migrations and events, such as, *e.g.*, the decline of Persia, the barbaric invasions, the decay of Rome, the rise and fall of Central-American civilization, etc.

While much evidence in favour of changes of climate in historic times has been brought forward, the opinion is quite widely held that a good deal of this is not wholly trustworthy. Much of it is so distinctly contradictory that in certain cases nothing less than a complete deadlock exists. Further, it is held by a considerable number of meteorologists that much of the evidence seems to have been interpreted without due consideration of controls other than climatic fluctuations. In cases where careful examination of the evidence has been made by experts in archaeology, botany, geology and history, there has usually been hesitation in ascribing the facts solely, or often even partly, to fluctuations in climate.

There have been several critical studies of the evidence concerning fluctuations in climate within historical times, such as those by J. W. Gregory,[7] Hildebrandsson[8] and Berg.[9] It seems, at the present time, to be the general consensus of the most expert meteorological judgment that there is not as yet sufficient unimpeachable evidence to justify a belief in any progressive change of climate within historic times. That there are certain fluctuations in the values of the climatic elements is, however, a well-established fact. The so-called Brückner period, averaging about 35 years in length, is generally recognized. No definite or universally accepted conclusion has yet been reached regarding the existence of other longer periods. A period of about 11 years in temperature, rainfall, and certain other meteorological phenomena has been made out by several investigators. On the whole, the variations in the values of these elements have appeared to be very slight, and the results are often debatable, if not contradictory. Köppen has greatly extended his investigations of sunspot controls over temperatures, begun some

30 years ago, and has found that the 11-year periodicity appears to be somewhat less marked but more regular than he at first thought it to be.[1] The increase of temperature within the tropics at times of sunspot minima is about 1°F. higher than in years of sunspot maxima, and becomes less and less apparent outside the tropics. The general conclusions reached by Dr. Gilbert T. Walker do not appear to indicate any marked influence of variations in sunspot activity upon atmospheric conditions.[2] The correlation coefficient in the case of rainfall, *e.g.*, is not, in general, shown to be much larger than would result from chance.

A. E. Douglass has for some 20 years been studying the evidence of climatic fluctuations given by tree rings in California and elsewhere. Some of his conclusions have been used by Huntington and others in their investigation of climatic fluctuations. In a recent volume, which also summarizes his earlier work, Douglass indicates that a close relation exists between the thickness of tree-rings and climatic conditions; sees an agreement between the tree-ring records and the results of meteorological observations during recent years, and finds evidence of periodicity, over large areas, in agreement with the sunspot cycle or multiples of it.[3] There is not as yet any agreement as to the causes of such climatic fluctuations. Very small irregular variations in the intensity of solar radiation are known to exist. There is also the sunspot period, and longer periods may later be established. A distinct inclination at present exists among meteorologists to seek the cause of climatic variations in changes in the general atmospheric circulation resulting from fluctuations in the sun's activity. There has been much discussion, but there is no unanimity of opinion, as to just how such variations in the amount of solar radiation will affect conditions on the earth's surface. A highly complex train of effects must obviously result, in which temperature, pressure, evaporation, cloudiness, and rainfall are all concerned, and in which readjustments in the general circulation of the atmosphere play an important part. The varying strength of the atmospheric and oceanic circulations and the resulting effects upon the development and location of the great "centres of action," and of the wind and rain belts, seem to many writers competent to account for any climatic variations which may have taken place in historical times. Thus, in one of the outstanding publications of the past decade, Helland-Hansen and Nansen, in their study of North Atlantic temperatures, conclude that variations in the supply of solar energy, acting through the atmospheric circulation, are the initial cause of temperature changes on the earth's surface.[4]

So far as the effect of a variation of short period like that of the sunspots is concerned, it seems highly probable that the effects are so many, so complex, and so mutually interdependent, that the periodic cause undergoes its next change before its effects are everywhere fully established. This point is emphasized by C. E. P. Brooks in a significant study of the secular variations in climate.[5] The sunspot period being so short, the "repercussions" do not "die down sufficiently to allow a clear vision of the relation between the solar cause and the terrestrial effect." By means of a new method of analyzing meteorological data with reference to secular variation, it appears that opposite kinds of changes in temperature, pressure and rainfall are taking place in different parts of the world in relation to a long period of sunspot numbers which shows a general decline since 1870.

The effect of volcanic dust veils in diminishing atmospheric transparency and thus affecting terrestrial temperatures has been brought forward by several writers as a possible contributing cause in climatic variations, in historical and in geological time.[6]

So far as changes of climate during the geological past are concerned, there has been a decided tendency towards seeking an explanation in factors which are recognized as being effectively at work in determining present-day climates, and a lessened appeal to purely astronomical causes, which in the past were most widely advocated.

The time has clearly not yet come when a general agreement is to be expected on a subject as highly complex as that of climatic fluctuations. The facts which demand explanation are not yet sufficiently well determined or correlated, and the processes which are at work are still too imperfectly understood.

Local Climatology.—Two countries, the United States and Australia, stand out by reason of the progress which has been made, during the past decade, in the scientific investigation of their climates. Mention is here made only of general studies dealing with these areas as a whole. In the United States, the preparation of a section on climate for a new "Atlas of American Agriculture" marks an important advance in the accurate charting and discussion of many of the essential features of the climatic conditions of this large area. This atlas will, for many years to come, be the standard authority on all the subjects with which it deals. At the beginning of 1921 only one part of the climatic section, that on frost, had been issued in its final form. Advance publication had, however, been made of the new maps of mean annual,[7] monthly and seasonal rainfall[8] and of the new maps of sunshine.[9]

The new rainfall maps are based on the records from about 3,600 stations, all covering or reduced to the uniform period of 20 years (1895-1914). The base maps show the main features of the topography, reasonable account of which is taken in locating the isohyetal lines. In the new series of sunshine maps the same basic period is used. Many details of rainfall and sunshine are further set forth by means of special diagrams and graphs. The whole subject of frost has been presented with a detail not hitherto attained in any other area of equal size in the world.[10] The average dates of first and last killing frost are charted (20-year period, 1895-1914), as well as the variations in the dates of spring and autumn frosts; the length of the growing season, etc.

Two new maps of average annual snowfall of the United States have been prepared. The first of these is based on observations made at about 2,000 stations during the 15 winters from 1895 to 1910.[11] In earlier maps, the observations came mostly from near sea-level, and hence the heavy snowfalls on the mountains were not indicated. On this new map, observations made at higher altitudes were also used and topographic effects were taken account of. A later map bears the date 1919.[12] This was prepared from all available records in the western mountains, and from the complete records E. of the Rockies for the period 1895 to 1914, and revised somewhat in order to bring it into conformity with certain obvious topographic influences. The first-named map brings out more clearly the heavier snowfalls on the mountains; the second adheres more rigidly to the actual observations. Investigations of relative humidities and of vapour pressures, and of the wind records for the 20-year period 1891 to 1910, have added to the more accurate knowledge of United States climates.[13]

The United States Weather Bureau has done useful work in summarizing the essential climatological data of the country by sections.[14] This publication includes the information usually desired regarding the climates of different parts of the country, brought together in convenient form for ready reference.

Australia is the second large area a knowledge of whose climatology has advanced very rapidly in the past decade. The Australian Commonwealth Bureau of Meteorology has issued an unusually valuable series of reports, dealing especially with rainfall, but also presenting many other essential facts concerning the general climatic characteristics of the country. These studies are notable because of their clear and concise method of treatment, and the emphasis which is laid on the practical economic aspects of the subject. A report on the climate and weather of Australia is one of the best available discussions of the meteorological and climatic conditions of any part of the globe.[15] Australian weather and climate have been discussed in publications by Dr. Griffith Taylor.[16]

The main thesis of these monographs is the climatic limitation and control of agriculture and of stock-raising. The results are likely to be of practical value in the future development of Australia. The extreme importance of rainfall is emphasized, not only of the annual amounts but also of the season at which the rain falls, and of its reliability.

While the meteorology of the Arctic has made little progress during the last ten years, the Antarctic has been visited by a large number of expeditions, most of the results of whose scientific work, as well as some of the results of work done prior to 1910, have been published in the last decade. These discussions include those relating to the British expeditions of 1901–4, 1910–3 and 1914–7; the Australian expedition of 1911–4; the Norwegian of 1910–2; the German of 1911–2. Meteorological observations are now available, for complete years, made at fixed land stations; on board vessels drifting slowly in the ice; on sledge journeys, and from the upper air by means of kites and balloons. The available material is, however, still too scattered and incomplete to give an accurate and satisfactory picture of Antarctic climate. Most of the discussions have concerned the physical problems of Antarctic meteorology rather than the larger facts and controls of climate. The mean temperatures of the higher southern lats. have been determined by Meinardus as follows:—

S. Lat.	60°	70°	80°	90°
Jan.	37.0° F.	29.7° F.	24.3° F.	21.2°F.
July	12.9°	−7.6°	−19.7°	−27.9°
Year	25.7°	9.0°	−5.1°	−13.0°

The fact that these lats. are colder in the Antarctic than in the Arctic is now abundantly confirmed. The Antarctic obviously has a distinctly continental climate, but with a cold summer. The lowest mean annual temperature hitherto recorded was observed at Framheim, the nearest fixed point to the South Pole at which observations have been made (−11.2° F.). Much light has been thrown on the cyclonic phenomena of the southern oceans through the inclusion, in both British and German publications, of a considerable series of daily synchronous weather maps.

Climate and Agriculture.—Recent studies of the larger controls of climate over crop distribution, and of weather factors which most affect the critical periods of growth and of yield of field and garden crops, have brought out much information which will prove of importance in the advance of agricultural climatology. The geographic origin of the world's food supply and of other essential agricultural products, and of the climatic and other factors which control the present distribution of the world's crops and live stock, have been discussed.[1]

In this atlas, the essential climatic controls in the case of the important crops in all parts of the world are briefly stated. Another outstanding publication, also of wide interest, deals with cotton.[2] The climates of all the cotton areas are discussed, detailed consideration being given to the United States. The facts here given are of practical value in the selection of the most favourable climates for future cotton-growing. A very practical application of scientific research to agricultural practice is seen in the establishment, for the United States, of a "bioclimatic law."[3] According to this law, there is a country-wide average rate of variation in the time of occurrence of the regular periodic events in plants and animals, depending on altitude, latitude and longitude. The rate is four days for each 1° of long., 5° of lat. and 400 ft. of altitude.

Forests and Climate.—But little important work has lately been done on forest influences upon climate. So far as this goes, it points to nothing more than inconsiderable effects. For example, in India the latest indications are that while forests tend to increase rainfall, the effects are by no means marked.[4]

In the United States, an investigation of the forests of the S.W. shows that their influence is essentially similar to that previously indicated by European observation.[5] In other words, forests have a little higher mean annual temperature than the open; somewhat modify the extremes of temperature; reduce wind velocity and decrease evaporation within the forest, but have only a negligible effect upon precipitation except in connexion with the distribution and disposal of snow and rain.

Physiological Climatology.—It has for some time been recognized that conditions which are best for human beings are moderately cool and moderately moist air, in motion, together with a reasonable variability of temperature. Numerous suggestions have been made regarding the instrumental measurement of the climatic elements most essential in this problem. In general, the tendency has been to use already available data on air temperature and relative humidity, or to employ ordinary wet and dry bulb thermometer readings. Dr. Leonard Hill has devised a so-called "Kata-thermometer" which indicates, by the rate of cooling of wet and dry bulb thermometers heated to about the surface temperature of the human body, the combined effect of temperature, humidity, wind, evaporation, etc.[6] Several investigators have sought to determine, in actual numerical values, the most favourable atmospheric conditions for man. Dr. Griffith Taylor, using wet bulb temperatures and relative humidities, has worked out the criteria of a suitable climate for Anglo-Saxons in the tropics.[7] The "type white climograph" which this study suggests as representing ideal conditions shows, for summer, a wet bulb reading of 62° F. and relative humidity of 68·5%; for winter, 37° F. and 81%. Using statistics of the efficiency of factory operatives, students and others in the eastern United States, Huntington has determined what he calls the "optimum" temperatures for man's greatest efficiency.[8]

These are outdoor temperatures of 60°–65° F. for maximum physical efficiency and 40° F. for maximum mental efficiency. There is also found to be a beneficial stimulating effect in a certain moderate degree of temperature variability, which is associated with storm controls. The different parts of the world are graded according to their approximation to such a climate, and the civilizations of those areas are also graded. A close agreement is found between the results. The conclusion is reached that a certain special combination of climatic conditions prevails today where high civilization is found; and that past climatic fluctuations which brought a similar type of climate were associated with corresponding periods of high civilizations.

Criticism of these far-reaching conclusions has been based on the insufficiency of the data of human efficiency upon which the study rests; the somewhat arbitrary combination of the climatic factors, with disregard of the element of humidity, and a lack of any general agreement as to the facts concerning the distribution of civilization and the occurrence of special climatic types in past times.

(R. De C. W.)

CLODD, EDWARD (1840–   ), English anthropologist, was born at Margate July 1 1840, and educated at Aldeburgh grammar school. At the age of 15 he became a clerk and seven years later entered the London Joint Stock Bank, Ltd., where he rose by 1872 to the post of secretary. He interested himself in questions of the descent of man and the origins of religion, and early became known as a rationalist thinker.

Amongst his writings are: *The Childhood of the World* (1872); *The Childhood of Religions* (1875); *Myths and Dreams* (1885); *Story of Primitive Man* (1895); *Animism or the Seed of Religion* (1906); *Magic in Names* (1920), and biographies of Huxley and Grant Allen, as well as a volume of *Memories* (1916) and a discussion of the possibility of human survival after death, entitled *The Question* (1917).

CLYNES, JOHN ROBERT (1869–   ), English politician, was born at Oldham March 27 1869 of working-class parents, and worked himself as an artisan for many years. He was active in the trade-union movement, and eventually became president of the National Union of General Workers, and chairman of the executive council. He came into Parliament as Labour member for N.-E. Manchester in 1906, when the Labour party were returned for the first time in numerical force—over 50 in all. It was not, however, until the World War that he attracted public attention. He protested, in Feb. 1915, on behalf of his party against the rise in prices, which he attributed mainly to contractors and dealers exploiting the needs of the people. His interest in this subject made it natural that he should be selected —as himself a working man—to be parliamentary secretary

under Lord Rhondda soon after the latter accepted the position of controller of food. In the arduous and successful work of that office he took his full share. He became president of a consumers' food council in Dec. 1917, so that the office might keep in regular touch with the needs of the public. When Lord Rhondda died, in June 1918, he succeeded him to the general satisfaction. He gave special encouragement to the creation of national kitchens, the number of which had grown by the end of Aug. to over 600, and he set up in Sept. inside the Ministry a food council to consider questions of policy, and to coöperate with other bodies dealing with the food problems of the Allies. In consequence of the decision of the Labour party to terminate its support of the Coalition Government he resigned office in Nov. just before the general election. At the beginning of the session of 1919 he was elected vice-chairman of the party, and he took a considerable share in debate, speaking with a moderation and appreciation of the standpoint of other classes not always manifested by Labour members. At the trades union congress in Sept. he made a strong speech against the policy of "direct action," pointing out that Labour could capture the political machine if working men were sufficiently united and sufficiently active, but that threats would only throw back their cause and set all other classes against them. But a year later he acquiesced in the establishment of a Labour council of action, and in the threat of a general strike in case of any military or naval intervention against the Soviet Government of Russia. In 1921 he was chosen chairman of the parliamentary Labour party.

COAL (*see* 6.575).—In 1910 the world output of coal, including lignite and anthracite, may be estimated to have been 1,160 million metric tons, and it reached 1,342 million tons in 1913. The rapid growth in the production of coal up to 1910 is indicated by the fact that in the period 1894–8 the average quantity raised each year was only 604 million tons, or about one-half the quantity raised in the year 1910. In the five years 1874–8, 285 million tons were raised each year on the average, or about one-fourth of the quantity raised in 1910.

The output of coal in 1913 was subsequently exceeded but once up to 1921, viz. in 1917, when 1,345 million tons were raised, and the dislocation in the production of coal caused by the World War is seen from the following estimates of output during the years 1910–20, prepared by the United States Geological Survey Department:—

	Estimated Quantity of Coal Raised (Million metric tons)	Percentage of 1913		Estimated Quantity of Coal Raised (Million metric tons)	Percentage of 1913
1910	1,160	86	1916	1,296	97
1911	1,189	89	1917	1,345	100
1912	1,249	93	1918	1,331	99
1913	1,342	100	1919	1,158	86
1914	1,205	90	1920	1,300	97
1915	1,196	89			

The effect of the war, however, was chiefly felt in Europe, as the following comparison of the output of coal in the years 1913 and 1920 shows:—

Continent	Output of Coal in		Increase (+) or Decrease (−) in 1920	
	1913	1920	Quantity	Percentage
	Million metric tons			
Europe	730·0	597·5	−132·5	−18·1
America: North	531·6	601·3	+ 69·7	+13·1
South	1·6	1·7	+ ·1	+ 6·2
Asia	55·8	75·8	+ 20·0	+35·8
Africa	8·3	11·8	+ 3·5	+42·2
Australia and Oceania	15·0	11·9	− 3·1	−20·7
World	1,342·3	1,300·0	− 42·3	− 3·2

The aggregate loss of output in Europe during the years 1914–20 was nearly equal to the quantity raised in the year 1913, or considerably more when allowance is made for the normal rate of expansion prior to the war. From the position of a continent self-contained in regard to coal supplies and able to furnish no inconsiderable part of the requirements of the navies and merchant fleets of the world, Europe had temporarily become dependent upon outside sources of supply. In 1920 coal was obtained chiefly from North America, but small quantities from South Africa, from China, from Australia and from Spitsbergen found their way to Europe.

While the output of coal in Europe in the year 1920 diminished by nearly one-fifth when compared with that of 1913, partly owing to reductions in the hours of labour and partly to labour disputes, the number of workpeople employed at coal-mines increased in the principal countries of Europe by about one-seventh. And after the conclusion of the war the question of the "nationalization" of the coal-mines (*see* NATIONALIZATION) became a subject of more or less acute controversy in the chief producing countries of the world.

The immense coal resources of the world were but imperfectly realized up to 1910, and knowledge with regard to them was greatly increased as a result of the Twelfth International Geological Congress held in 1913 at Ottawa, for which a monograph on "The Coal Resources of the World" was prepared. From this the following summary is taken:—

Continent	Lignites and sub-Bituminous Coals	Bituminous Coals	Anthracite and semi-Anthracite	Total
	Million metric tons			
Europe	36,682	693,162	54,346	784,190
America: North	2,811,902	2,239,682	21,842	5,073,426
South	4	31,398	700	32,102
Asia	111,851	760,098	407,637	1,279,586
Africa	1,054	45,123	11,662	57,839
Australia and Oceania	36,270	133,481	659	170,410
World	2,997,763	3,902,944	496,846	7,397,553

The coal raised during the 11 years 1910–20 amounted to 13,771 million tons, or one-fifth of 1% of the estimated reserves. It should, however, be added that no deduction has been made in framing these estimates for coal which was not mineable, nor for the loss of coal in working. A large part of the coal included will be raised with great difficulty and the loss in mining will also be great.

UNITED KINGDOM

For at least half a century prior to the outbreak of war the production of coal in Great Britain increased at a substantial, if unequal, rate annually. But after the year 1913 this movement was arrested and during the three years 1918–20 the output of coal was only equal to the quantity raised in the years 1902–4. Estimated on the experience of the period 1871–1900 the output of coal in 1918–20 should have been not less than 300,000,000 statute tons per annum.

After the conclusion of the war the number of persons employed at coal-mines was greater than at any previous date, and in 1920 was 50% greater than in the year 1903. The hours of labour of those employed below ground, it is true, had been twice reduced since that year. An 8-hour shift from bank to bank (equal to more than 8½ hours per man on the average) was introduced in 1909–10, and a further reduction to 7 hours per shift was effected in July 1919. No general change was made in the hours of labour of surface workers until Jan. 1919, when a maximum 49-hour week was established. In July of the same year this was reduced to 46½ hours per week, or a total reduction of 4½ to 11½ hours per week over the whole period.

Prior to the introduction of the 8-hour shift below ground the annual rate of output was 285 tons per person employed, and the normal rate of output subsequently appears to have been some 20 to 25 tons less. In the year 1920 the output of coal per person was 191 tons, or about 200 tons, making allowance for the effect of the national strike of coal-miners in that year.

With the shrinkage in the supply of coal there had been a serious increase in its selling price. Between the years 1910 and 1914 the average selling price at the pit rose from 8s. 2d. to 10s. per ton. During the war the selling price was gradually raised, and it stood at 20s. 11d. per ton on the average in 1918. This was due partly to the increased cost of timber and stores, but

chiefly to the general upward movement in nominal wages. The average selling price of coal during the latter half of 1920 was 39s. to 40s. per ton, the average for the year being 34s. 7d. per ton.

One bright feature alone reveals itself in this picture of increasing cost and diminishing supplies of coal, in the increasing safety of the workers employed at the mines. Though the years 1910 and 1913 were both marred by mining disasters of some magnitude—that at the Sengheneydd pit in Glamorganshire in the latter year being the greatest on record—there was a noticeable diminution after 1910 in the number of persons killed and injured by accidents at coal-mines.

Particulars of the quantity and value of the coal raised, the number of persons employed at coal-mines, and the numbers killed and injured by accidents during the years 1910–20, will be seen in the statement which follows:—

	Output of Coal			Number of Persons Employed at Coal-mines	Number of Persons Killed or Injured by Accidents [3]	
	Quant'y (Million statute tons)	Value at Pit (Million £)	Average Value per ton (s. d.)		Killed	Injured
1910	264.4	108·4	8· 2	1,032,700	1,775	159,042
1911	271.9	110·8	8· 2	1,049,900	1,265	166,616
1912	260.4[1]	117·9	9· 1	1,072,400	1,276	150,652
1913	287.4	145·5	10· 2	1,110,900	1,753	177,189
1914	265.7	132·6	10· 0	1,041,200[2]	1,219	158,862
1915	253.2	157·8	12· 6	939,600	1,297	(Particulars not available)
1916	256.4	200·0	15· 7	984,800	1,313	
1917	248.5	207·8	16· 9	1,006,300	1,370	
1918	227.7	238·2	20·11	994,300	1,411	
1919	229.8	314·1	27· 4	1,176,100	1,118	117,422
1920	229.5	306.9	31· 7	1,233,200	1,103	117,302

The period covered by the statement above includes the years down to 1914 during which the development of the coal resources of the country reached its zenith under the individual ownership of the mines. Early in 1912 a national strike of miners laid the pits idle for a period of six weeks and was settled by the passage of the Coal Mines (Minimum Wage) Act, 1912.

Effects of the War.—In Aug. 1914 war was declared, and early in 1915 the necessity for Government supervision of the production and distribution of coal became apparent. At first this was restricted to the limitation of the selling price of coal at home and of the quantity sold abroad. By the middle of 1916 the number of miners employed had fallen by nearly 14% since July 1914, the younger, stronger and the most capable amongst whom had joined the fighting forces. The loss was much greater in reality, since 282,200 men had left the mines up to the end of March and the places of some 116,900 of these men had been taken by others. By the end of the war 400,000 coal-miners had joined H.M. forces. Increasing difficulties in the supply and distribution of coal were experienced, and in order to deal with them a committee representing various Government departments, railway companies, colliery owners and coal factors and merchants was appointed in Jan. 1916. This committee co-ordinated the action of other committees of colliery owners in each coal-field. At the end of 1916 acute labour troubles in the South Wales coal-field compelled the Government to take possession of the mines in the district, and on March 1 1917 similar action was taken with regard to all coal-mines.

Output and Management.—Up to 1916 the rate of output in normal years was still at or above 260 tons per person employed, the total output in 1916 being 31,000,000 tons less, and the number of persons employed 126,000 less than in 1913, the year of maximum production. The average selling price of coal in 1916, whether for consumption at home or abroad, was 15s. 7d. per ton, or 53% higher than in 1913, the highest pre-war figure since records were first established in 1882. From March 1917 to the end of March 1921 the mines were under Government control and a special Department of State was created for their administration. By powers conferred upon the Board of Trade by the Mining Industry Act, 1920, this Department has since been organized on a permanent basis with a view to the better administration of the mining industry generally, and was assisted during the period of control by the central and district organization created early in 1916. In June 1917 the price of coal sold for export and for bunkering vessels was definitely brought under control and so remained until May 1919. The control of prices at home was only relinquished on March 1 1921.

As compared with the year 1916 the output of coal had fallen in 1920 by 27,000,000 tons, while the price had risen by 19s. per ton and some 248,000 additional workers had been enrolled.

The output of coal in relation to the number of persons employed at coal-mines is a convenient measure of changes which occur in the productivity of the industry, but unless allowance is made for the amount of employment available the results are liable to be misleading. Fortunately for the comparison which follows, employment at coal-mines was exceptionally good from 1913 onwards except during the latter part of the years 1914 and 1920. In 1910 and 1911 employment was moderate, and in 1912 the pits were idle for about six weeks owing to the minimum-wage dispute.

Absenteeism from work on the part of the miner amounted during the war period to about 10% of the total number of possible shifts. Of this one-half was due to sickness, injury and other unavoidable causes. The normal working time of the miner in the several districts approximates closely to 5½ days per week, including overtime. In the case of coal-getters about 5 days per week is usual.

	Tonnage Raised per Person Employed	Percentage of 1913		Tonnage Raised per Person Employed	Percentage of 1913
1910	260	99	1917	250	95
1911	261	99	1918	228	87
1912	245	93	1919	202	77
1913	263	100	1920	191	73
1914	252	96	Average for years		
1915	266	101	1910-20	244	93
1916	266	101	1900–9	285	108

When compared with the output of the American miner, these figures, even in years of maximum output, appear to be small. It is necessary, however, to bear in mind the relative thickness and accessibility of the coal measures from the surface in each country, the position in which they are found, the extent to which mechanical cutting is capable of adoption and the method of haulage employed below ground. In some or all of these ways the American coal-miner enjoyed considerable advantages over the British miner.

But the output rate is affected by the extent to which development work in the pits is maintained and by the opening of new and productive pits. Since the middle of the year 1914 it is probably true to say that such work has suffered considerably, though by concentrating upon the best seams a higher rate of output was achieved during the earlier years of the war.

The progressive nature of the fall in the rate of output, synchronizing as it did with successive increments of wages, seems to indicate that other causes were partly responsible—and this responsibility the management must share with the miners.

In the year 1917 the method of percentage additions to hewers' wages with corresponding additions to the wages of time-workers was abandoned in favour of flat-rate additions to the wages of workers of all classes, and, with minor exceptions, of all ages, as in the case of the war wage and Sankey wage. These flat-rate increments favoured the lowest-paid workers at the expense of the higher-paid workers, since the relationship of the wages of each class was altered. Successive additions of uniform amount had the effect of raising the minimum rates of wages to a level at which many hewers found the inducement to rest upon it greater than they could resist. In 1920 an attempt was made to restore the percentage principle in wage adjustments and greater differentiation in respect of age, but with little success.

The output of the miner, however, is influenced by good and bad management, and it is necessary to consider how the management of the mines was affected by the arrangements made during the period of control. The position with regard to profits in the coal-mining industry in South Wales prior to Dec. 1 1916 and in all other coal-fields to March 1 1917, when the mines came under control, was the same as in all other industries. The Coal Mines Control Agreement (Confirmation) Act, 1918, provided for the retention by colliery owners of the profits earned when they did not exceed the amount of the pre-war standard fixed for excess-profits duty. Where this amount was exceeded, one-fourth was retained and the balance was collected as coal-mines excess payments. From the sums so collected the pre-war profit of the collieries earning less than the pre-war standard of profit was made good, but the full pre-war standard

[1] Not including 2,268,000 tons of refuse raised with coal and similarly in subsequent years. For years previous to 1912 such refuse was included.

[2] The number of persons employed during Jan. to July 1914 was 1,116,600. On the last pay day in Dec. the corresponding number was 965,800, approximately, and the number taken represents the mean of these numbers.

[3] Including deaths and injuries through accidents reported at all mines of coal, stratified ironstone, shale and fireclay.

of profit was permitted only in cases where output was fully maintained and the business was efficiently conducted.

This arrangement was amended retrospectively as from April 1 1919 by the Coal Mines (Emergency) Act, 1920, by which the industry was regarded as a single concern. Where the pre-war standard of profit was exceeded, nine-tenths of the excess profit was paid over to the State, while of the remaining tenth, after the deduction of excess-profits duty, one-half was distributed on a tonnage basis to all collieries and one-half was shared by the collieries contributing the excess profits. The net amount of excess profit retained by the industry was 4% of the gross profits earned.

Owing to the serious fall in the price of coal sold abroad early in 1921 a further variation was made in the existing arrangement by which profits in excess of nine-tenths of the pre-war standard were required to be surrendered and shared as from Jan. 1 1921. On March 31 1921 the period of control was terminated.

The general effect of these intricate arrangements was to curtail the excess profits of colliery owners much more severely than in other industries, and it is difficult to resist the conclusion that the decline in the rate of output after 1916 was largely due to the stifling of incentive in both the management and the workers.

The distribution of the revenue of the industry in 1913, 1918 and 1920 is shown by the following comparisons, the amounts being calculated on the basis of the tonnage of coal disposed of:—

	1913 (Jan. to Dec.)		1918 (July to Sept.)		1920 (July to Sept.)	
Cost of Production:	s.	d.	s.	d.	s.	d.
Wages	6	4	15	7½	26	3
Stores and Timber . }	1	10¼	3	6½	5	5¾
Other Costs . . }			1	4¼	2	6¼
Royalties		5¼		7¼		7½
Total Cost . . .	8	7½	21	1½	34	10½
Proceeds from Sales . .	10	1½	24	10	39	7
Balance of Proceeds . .	1	6	3	8½	4	10¼*
Coal Raised per Person Employed per Quarter . .	65½ tons (average)		58¾ tons		50 tons	
Earnings per Person Employed per Quarter . .	£21 (average)		£42		£59	

Though not strictly comparable owing to minor differences in the method of computation, these figures show the progressive increase in the cost of production and the disparity in the rates of output and earnings of the workers. In 1913 rather more than one ton of coal was raised on the average for each man shift worked, the average earnings per shift being about 6s. 6d. In the third quarter of 1920 the average earnings were nearly 17s. per shift, while not more than 16 cwt. of coal were raised.

Against the balance of proceeds has to be set the cost of depreciation, interest on loans and the profits in each year, and in 1918 and 1920 excess-profits duty and the cost of control. Various estimates have been made of the amount of capital invested in the coal-mining industry. Owing to the combination of coke, iron and steel-making with the production of coal, the results are necessarily approximate, but for the years prior to the outbreak of the war may be taken at £130,000,000, not including the capital invested in coke ovens and by-product plant. The capital of the industry in 1921 was more than £50,000,000 greater.

During the years 1909 to 1914 the average profits earned, apart from royalties, were nearly 10% per annum of the capital invested, making no deduction for profits carried to reserve and capitalized. In the three years following profits, exclusive of royalties and excess-profits duty, amounted to 17% per annum, and during the years 1917 to 1921, to 15½% per annum. Making allowance for profits reinvested in the industry during the seven years 1914–21, the amount available for dividends, partners' drawings, and income tax represented a possible yield of 11¾% per annum on the capital employed in the industry.

During the quarter ended Sept. 1920 the average price of coal sold at home was just over 33s. per ton at the pit, that of coal shipped as foreign bunkers 67s. 3d. per ton and of coal exported 76s. 8d. per ton. The surplus revenue on the bunker and export coal provided the fund from which the profits of the industry were paid. During the winter of 1919–20 a special rebate of 10s. per ton was granted on coal sold for domestic use, including coal converted to gas and electricity for domestic heat and light. The average selling price at this period did not greatly exceed 19s. per ton at the pit.

The home consumer, it will be seen, enjoyed considerable advantages in regard to the price paid for coal, but the protection of the home consumer extended to the quantities supplied, which were maintained throughout the war and subsequently at the same level, approximately, as before the war.

*Including the sum of 1¾d. per ton disposed of commercially, derived from the proceeds of miners' coal supplied at special prices.

The quantities of coal shipped abroad during the years 1910–20 and the quantities available in each year for consumption at home are shown below:—

	Coal Exported †	Coal Shipped as Foreign Bunkers	Coal Available for Home Consumption
	Million	statute	tons
1910	65·0	19·5	179·9
1911	67·8	19·3	184·8
1912	67·5	18·3	174·6
1913	77·3	21·0	189·1
1914	62·5	18·5	184·7
1915	46·3	13·6	193·3
1916	42·0	13·0	201·4
1917	38·5	10·2	199·8
1918	34·6	8·7	184·4
1919	39·3	12·0	178·5
1920	29·7	13·9	185·9

As compared with the year 1913 the reduction in output amounted in 1920 to 58 million tons which fell almost entirely on supplies for shipment abroad, the home supply suffering to the extent of little more than three million tons. The bulk of the coal shipped abroad, apart from that shipped as bunkers, was supplied to Europe and the countries lying round the Mediterranean Sea as is shown below:—

Destination	1913	1920
	tons	tons
Europe and Mediterranean Countries	63,481,000	22,791,000
Africa and Asia (exclusive of Mediterranean Countries)	2,678,000	932,000
South America	6,939,000	557,000
North and Central America . .	160,000 }	652,000
Other Destinations.	142,000 }	
Total: (Coal Cargoes) . . .	73,400,000	24,932,000
Quantity Shipped as Bunkers by Vessels Engaged in the Foreign Trade .	21,032,000	13,923,000
Coke and Manufactured Fuel Exported in Terms of Coal . . .	3,006,000	4,821,000
Total Shipments . . .	98,338,000	43,676,000

The chief uses to which the home supply is put will be seen from the following comparison of the distribution of coal in 1913 and 1919:—

Use	1913	1919
	Million statute tons	
Domestic	35·0	36·5
Railways	13·6	13·5
Steamships (Coasting)	2·4	1·3
Gas Works	17·0	17·8
Colliery Engines and Miners' Fuel .	23·0	22·5
Blast Furnaces	21·2	15·7
Other Industries and Commercial Uses	76·9	71·2
Total	189·1	178·5

The reduction of 10·6 million tons in the consumption of coal between 1913 and 1919 was almost entirely accounted for by the lessened industrial demand for coal upon the cessation of war.

Plant and Equipment.—While the importance of an adequate supply of coal assured a certain measure of priority during the war to the demands made for colliery plant and equipment, it was inevitable that some falling off should be observed in the provision and perfection of plant and equipment as compared with the years immediately preceding the war. The importance of this arises from the fact that the coal used at colliery engines amounts to about one-tenth of the consumption at home.

In the year 1907 the capacity of the engines in use at coal-mines (including the stratified iron-mines of the Cleveland district) was 2,293,978 H.P., of which some 7% was used for the generation of electric power and light. The capacity of the motors then installed is known, but since the year 1912 the capacity of electrical apparatus in use at coal-mines has doubled.

There were 1,959 mechanical coal-cutters installed at mines in 1910 and nearly 16 million tons of mineral were cut by these machines. In 1920 the number of machines had increased to 5,073 with an output of 30 million tons of mineral. The chain-drive machine has shown the greatest relative increase in the interval, though percussive machines show the greatest absolute increase.

The tenacity with which the industry clings to past tradition is nowhere seen more clearly perhaps than in the maintenance of horses and ponies for haulage work below ground. In 1920 there were 67,748 horses and ponies so employed at coal-mines, or only 3,778 less than in 1912. The number of mechanical conveyors employed at the coal face increased from 274 in 1910 to 823 in 1920.

† Including the coal equivalent of coke and manufactured fuel exported.

While the tallow dip used as an illuminant below ground is not yet extinct, the safety lamp is all but supreme. In 1910 there were 705,482 of these in use, including 2,055 electric portable lamps. The total number of safety lamps in use in 1919 was 833,880 and of these 197,722 were electric lamps. In 1920 the number of electric lamps in use had risen to 245,900. The caution which necessarily marks the extended use of electricity below ground for lighting and power is less observable in the increased use of portable electric lamps, but there are limits to the universal use of electric lamps in mines where the risk of finding gas is great.

Accidents, Safety Measures and Health.—The usefulness of governmental control of industry is exemplified to an exceptional degree by the notable reduction which has taken place in the number of fatalities and injuries to the workers at coal-mines. In the years 1851-60, the earliest for which complete information is available, the number of deaths from accidents at coal-mines was 4·07 per 1,000 persons employed per annum, while during the years 1910-20 the number reported was only 1·27 per 1,000 persons per annum. In the United States 3·40 deaths per 1,000 persons employed occurred through accidents at coal-mines during the years 1910-9, or nearly three times as many as in the United Kingdom.

The period from 1910 opened with a series of disasters, two of which were exceptionally severe. The principal disasters occurring in the years 1910-20 include the following:—

	Name and Situation of Pit	Number of Lives Lost
1910	Wellington Pit, Whitehaven Colliery, Cumberland	136
1910	No. 3 Bank Pit, Hulton Colliery, Lancashire (Pretoria Pit)	344
1912	Cadeby Main Colliery, Conisborough, Yorkshire	88
1913	Senghenydd Colliery, near Caerphilly, Glamorgan	440
1918	Minnie Pit, Podmore Hall Colliery, Newcastle, Staffs.	155

The Royal Commission on Mines, which was appointed in 1906, dealt exhaustively with the health and safety of miners and the administration of the Mines Act. The chief recommendations of the Commission related to the augmentation of the staff of mines inspectors; alteration of the system of inspection and the appointment of practical miners on the inspectorate; fixing of responsibility upon owners and their agents; qualification by examination or experience of firemen and deputies; greater regularity and frequency of inspections; a higher standard of ventilation; investigation of the methods of minimizing the quantity of coal-dust in mines; precautions to be adopted in shot-firing; rules for the proper testing and use of safety lamps; effective timbering of mines; regular medical inspection of winding enginemen; organization of rescue stations and the provision of rescue appliances; provision for pit-head baths and dressing-rooms; and the accurate keeping of colliery plans. Practical effect has now been given to the majority of these recommendations, which were embodied in the Coal Mines Act, 1911. This Act consolidated and codified the law in regard to safety at coal-mines and was at the time of its promulgation the most detailed of any form of Government regulation of industry.

The most notable additions made in the decade to the provisions for the safety of mine workers were the organization of measures for effecting rescues from accidents below ground due to gas, fire or explosions, which was brought into operation in 1910, and the introduction of preventive measures against explosions of coal-dust.

Fairly complete arrangements had by 1921 been made for the organization and training of rescue brigades and the provision of appliances at mines. At the end of 1919 there were 49 central rescue stations each with its trained rescue brigade, a minimum provision of breathing apparatus and other appliances, and able to supply the oxygen or liquid gas required for the use of the former. These stations provided the rescue service for 610 mines, or groups of mines, and there were in addition 553 mines or mine groups at which 1,263 rescue brigades were maintained with a suitable proportion of breathing apparatus and appliances. These brigades are recruited from the mine workers and each consists of five or six men who are required to qualify by prescribed courses of training and practice, to be familiar with mine plans, the use and construction of breathing apparatus and skilled in the detection of poisonous or inflammable gases.

Following upon the recommendation made by the Royal Commission on Mines, experimental work with regard to the origin of coal-dust explosions in mines and the measures to be taken for their prevention was carried out at Altofts in Yorkshire by the Mining Association of Great Britain, the mine-owners' organization. In 1911 the Home Secretary appointed a committee of experts to control and direct an experimental inquiry at Eskmeale, near Barrow-in-Furness, in continuation of this work.

The main conclusions arrived at as a result of these experiments were that by stone-dusting or by watering mines, or by a combination of both methods, the risk from explosions would be very greatly minimized, if not prevented, and a preliminary communication in this sense was sent to colliery owners in 1912. Owing to the war, statutory effect was not given to the recommendations of the Home Office Committee until July 1920.

The number of deaths and injuries to persons caused by accidents at all mines of coal, stratified ironstone, shale and fireclay in the years 1910, 1913 and 1920, distinguishing the place and cause of injury or death, is shown below. Injuries involving an absence from work for less than seven days are not recorded:—

Cause of Death or Injury	1910	1913	1920
Number of Persons Killed			
Below ground			
Explosions of firedamp	501	462	26
Falls of ground	636	620	544
Shaft accidents	89	98	40
Haulage accidents	286	251	237
Other accidents	110	149	118
Total: Below ground	1,622	1,580	965
Surface			
On railways, sidings or tramways	71	81	54
Elsewhere on surface	82	92	84
Total: Surface	153	173	138
Total: Below and above ground	1,775	1,753	1,103
Per 1,000 persons employed	1·69	1·55	0·88
Excluding deaths due to explosions of firedamp	1·10	1·04	0·85
Number of Persons Injured			
Below ground			
Explosions of firedamp	167	131	105
Falls of ground	55,967	62,094	41,358
Shaft accidents	851	825	486
Haulage accidents	47,083	43,993	28,937
Other accidents	43,063	56,441	35,844
Total: Below ground	147,131	163,484	106,730
Surface			
On railways, sidings or tramways	4,315	4,102	2,946
Elsewhere on surface	7,596	9,603	7,626
Total: Surface	11,911	13,705	10,572
Total: Below and above ground	159,042	177,189	117,302
Per 1,000 persons employed	152	156	94
Number of persons employed[1]:			
Below ground	848,381	909,834	990,359
Above ground	201,026	218,056	257,865
Total	1,049,407	1,127,890	1,248,224

The accident experience at coal-mines in the years 1919 and 1920 is similar and differs widely from that of 1910 and 1913 whether the disastrous explosions of the earlier years are included or not. Having regard to the exceptional conditions of the industry in 1919 and 1920, however, it would be premature to conclude that a permanent reduction of the magnitude indicated by the figures above had taken place in the number of deaths and injuries caused by accidents.

The staff of inspectors in 1921 numbered 81, or twice as many as in 1910; but greater regularity and frequency of inspection would appear to be a less adequate explanation of the diminished number of accidents than the growing self-consciousness of the workers as a class. This growth is the outcome of the improvement in the general standard of education, and it has been stimulated by the measure of responsibility with which certain classes of workers have been invested since the year 1910. Indications of this may be seen in the partial satisfaction of the demand for the appointment of practical miners as inspectors, in the number of apprentices, workmen and colliery officials who obtain certificates of competency each year as managers and under-managers of mines, and in the provision made in the Coal Mines Act, 1911, for the certification of firemen, examiners, and deputies. Altogether 115,000 candidates had up to

[1] Including persons employed at stratified ironstone, shale and fireclay mines.

1919 presented themselves for examination, the majority of whom were successful. Nor should sight be lost of the training of the rescue brigades in this connexion.

While the contribution of each and all of the factors referred to above cannot be ignored, the question arises whether some more fundamental cause may not be responsible for the greatly reduced number of accidents. Reference has already been made to the effect of the Minimum Wage Act of 1912 upon the rate of production of coal, and it is not inconceivable that economy of physical effort may have diminished the accident risk of the workers.

Statistics with regard to the mortality of miners show that although they appear to suffer more than the average from diseases of the respiratory system, the mortality of miners from phthisis is little more than one-half of the average, as is also that from alcoholism and liver diseases and from suicide. The mortality of miners from influenza, cancer, diseases of the nervous and circulatory systems and Bright's disease is also below the standard.

The virility of the miner as a class is further attested by the information obtained in 1911 with regard to the fertility of marriage. The class showed a higher number of children born per family than in any other social class, but it was also shown that in no other class of the community is the rate of child mortality higher. The importance of the housing problem for miners will be obvious.

Position in 1921.—The year 1921 opened disastrously for the coal-mining industry owing to a wave of industrial depression as widespread as it was severe. This was followed by a dispute of unprecedented magnitude with regard to the future regulation of wages (*see* STRIKES). The output of coal during the first quarter of the year was at the annual rate of little more than 215,000,000 tons, while during the whole of the second quarter nearly all the pits were idle. Nor were the effects of the industrial depression confined to the home market. When early in 1921 the restrictions on the supplies of coal for bunkering vessels and for export were finally removed, British supplies abroad came sharply into competition with those from the United States and with German coal supplied to France and Belgium by way of reparation.

Yet, disastrous as were the immediate consequences to the industry, signs were not wanting that the industry might be restored in the near future to a degree of efficiency not previously surpassed. The turmoil of recent years would have been in vain if it had not settled one or two fundamental questions in no uncertain measure. It was already clear that the time had not yet arrived when the State could with advantage to the community take over the ownership of the coal-mines, notwithstanding the conclusions of the Coal Industry Commission of 1919. But it was not less clear that the principles which had hitherto governed the relations of capital and labour in the industry were wrong. The regulation of wages by reference to the selling price of coal with its evil corollary—the limitation of supply—had gone beyond recall. The proposal made by the mine-owners in 1921 to regulate wages and profits in accordance with the prosperity of the industry was based upon principles as fruitful as they were sound, and now that ways and means for the adoption of the proposal have been found, it is not too much to say that a key has been fitted to the gates of a new world.

The ability of Great Britain to maintain its position industrially is largely dependent upon the existence of a cheap and plentiful supply of coal. Under efficient management no reasonable doubt can be entertained with regard to the ability of the industry to furnish these supplies, and certain qualities of coal produced are unrivalled. Moreover, their proximity to the sea ensures advantages which few other coal-producing countries possess, and it needs but a brief examination to show what abundant reserves of coal are still available.

Reserves.—In 1904 the Royal Commission on coal supplies estimated the reserves of coal within 4,000 ft. of the surface at 141,636 million tons. Sir Aubrey Strahan, formerly Director of the Geological Survey of England and Wales, reëxamined the evidence and he concluded that 178,727 million tons of coal remained unworked in the year 1910. The quantity available, as thus estimated, would be in close agreement with the earlier estimate when allowance is made for the coal raised during the interval and the quantities which must be left for the support of surface buildings, barriers, etc. The latest estimate was that made in the year 1915 by Prof. H. Stanley Jevons, according to which the reserves of coal were placed at 197,000 million tons within 4,000 ft. of the surface. When the necessary deductions have been made for loss in working and for the coal raised since 1910, the quantity available for use would be some 13,000 million tons greater than the previous estimate.

Having regard to the proved extensions of the concealed coal-fields of Yorkshire, Nottinghamshire and Kent since the earlier estimates were framed, it may be assumed with some confidence that the reserves of coal available in 1921 amount to not less than 135,000 million tons, and might amount to 150,000 million tons, in addition to further considerable quantities at depths lower than 4,000 ft. or in concealed areas.

Some idea of the magnitude of the reserves of coal thus indicated will be gained from a consideration of the output since 1855 shown below. The quantities of coal shipped abroad and available for home consumption are added for comparison:—

Period	Coal Raised	Coal[1] Shipped Abroad	Coal Available for Home Consumption
	Million	statute	tons
1855 to 1860	412·8	38·5	374·3
1861 " 1870	974·9	94·0	880·9
1871 " 1880	1,311·0	187·2	1,123·8
1881 " 1890	1,642·6	314·7	1,327·9
1891 " 1900	1,954·4	457·8	1,496·6
1901 " 1910	2,453·7	732·8	1,720·9
1911 " 1920	2,530·5	654·3	1,876·2
Total 1855–1920	11,279·9	2,479·3	8,800·6

(R. F. T.)

UNITED STATES

Previous to the 10-year period ushered in with 1911, bituminous coal production in the United States was scattered, uncoördinated and wasteful. The mines had a variable but large idle capacity, and the uncertainty of operations was at once a menace to the stability of the labour supply and to the maintenance of an adequate output: the technique and practice of storing coal were imperfectly developed, as was still the case to a great measure in 1920; the seasonal fluctuations of demand were uncompensated. These conditions were essentially the product of past circumstances—excessive competition, over-development of resources, and inadequate prices at the mine mouth, which led to poor engineering and low recoveries of values. The technology of production during the World War period—1914–8—showed great improvement, and there was evidence of growing industrial efficiency in extracting coal, although this progress was accompanied by excessive prices and an approach to monopolistic conditions. Bituminous and anthracite formed over a third of all U.S. freight in 1920, but transportation was the weakest link in the supply. Continuous mining depends on an unbroken movement of coal-cars past the mine mouths; and the number of coal-cars has never been equal to the full capacity of the developed mines. Unless railroad equipment becomes more nearly adequate, every period of industrial prosperity must result in a car shortage.

The United States had in 1920 the largest coal reserve of any country—about 3,527,000 million out of a total world reserve of 7,900,000 million tons, and a good reserve of each of the several classes of coal. For many generations there will be no danger of a shortage except of anthracite, good coking coal, and the highest grades of steam coal, which in 1920 were being actively mined. Each year found anthracite more of a luxury. Three thousand million tons of hard coal had been consumed, and the thinner, deeper and poorer seams were being mined. If the rate of consumption in 1920 continued, the United States would use up more anthracite between 1920 and 1940 than it did in the preceding 100 years. It is bituminous coal, therefore, that will support the future industrial life of the United States. According to geologists the country had in 1920 upward of 1,400,000 million tons of the various grades of true bituminous coals in addition to 49,863 million tons of semi-bituminous, 987,514 million tons of sub-bituminous and 1,093,290 million tons of lignite. Of these total deposits, however, less than 5% were high-grade coals. Almost all the production before 1920 came from this better class of

[1] Including the coal equivalent of coke and manufactured fuel exported and the coal shipped as bunkers by vessels engaged in the foreign trade.

fuel. The earliest depletion of steam and gas coals will come in the fields that have supplied the great manufacturing districts of the eastern states.

Throughout the greater part of the country the large operating coal companies owned both surface and mineral rights. In certain districts coal land that sold in 1910 for $50 an ac. brought $700 in 1920. Seams that had netted the owners royalties of 6 to 10 cents a ton were often leased on a royalty basis of 30 cents per ton. In the Rocky Mountain region the Government sold the coal rights, but the state school lands of Colorado and Wyoming were generally leased at royalties of about 10 cents a ton. In the state of Washington a considerable area of the bituminous district was owned by the Northern Pacific railway, which had opened up the territory and had secured land grants from the Government. The royalty was from 15 to 25 cents a ton. In Alaska, in the Matanuska and Bering river bituminous fields, and in the Nenana lignite field, the Government offered the coal for leasing at 2 cents a ton for the first period, under restrictions providing for conservation and reasonable prices to consumers. Some units were taken up in the Matanuska and Bering river fields, but as the measures are badly contorted and the coal-beds difficult to trace progress was slow, and in 1920 production had scarcely begun. In 1920 the Alaskan Railway Commission was working some mines temporarily at Chickaloon and Esak creek to obtain a supply of coal pending the development of other mines by lessees. Congress, in opening the coal lands in Alaska for leasing, reserved tracts of not exceeding 7,680 ac. and 5,120 ac. respectively in the Matanuska and Bering river fields, for the use of the navy. In the western states the Government still owned large areas of coal and lignite lands generally remote from railways and difficult of access, but containing enormous reserves. In 1920 the Gebo mine at Gebo, Wyo., was the only one leased to an operating company by the Government, but the extension of a leasing system similar to that proposed for Alaska will ultimately be effected.

In the United States the two branches of coal-mining—anthracite and bituminous—present totally different aspects. In fact, it has become almost an axiom that what is true of the anthracite industry is untrue of the bituminous industry. The anthracite industry is well organized, and railroad connexions make it notably efficient and powerful. Bituminous coal, on the other hand, is so widely distributed on both public and private lands that no organization of private companies was ever able to control the industry. All centralized control of coal production was always opposed by Congress and the general public. Only during the World War did the United States attempt to exercise authority over commercial mining and the sale of coal. A fuel administration was created, and coal was shipped under its instruction and at prices fixed by it. Government control practically disappeared with the war. There was a growing feeling, however, that production and distribution should be classed as a public utility and regulated.

In the 10 years from 1891 to 1900 the average annual working time of the mine workers in the anthracite regions ranged from 150 to 203 days, with a mean average of 176 days. During this period the entire anthracite industry was demoralized. A great strike occurred in the hard-coal region in 1902. President Roosevelt appointed a commission, and the anthracite industry emerged from the difficulties plus a Board of Conciliation, composed of representatives of the operators and the miners, which was still in power in 1920. Under this plan the annual working time in the hard-coal mines increased gradually to 229 days in 1910, about 30% over the annual average working time of the 10-year period preceding the appointment of the Board. From 1911 to 1920 the annual average never fell below 230, and the mean was 255 days. The better conditions for miners in the anthracite field after 1902 were not solely due to increased annual working time. Between 1902 and 1920 there was also an increase in wages of something like 85 per cent. In the period 1900–10, the production of anthracite per man per day increased materially, but the next decade, 1910–20, showed a drop, due to the reduction of the length of the working-day from nine to eight hours.

In 1920 it seemed practically impossible to duplicate in the bituminous fields the conditions existing in the anthracite region. The anthracite mines all lie in a small area of one state, Pennsylvania. The collieries were all owned by a few large companies, which rendered it possible to centralize the control in a few men. But bituminous coal in 1920 was mined in 27 states, various producing districts competing for the same markets. It was because of this wide distribution of soft coal that it had never been possible to bring about unified action. Yet production managed to keep pace with the country's normal industrial growth. The industry grew from an output of 111,000,000 tons in 1890, from mines whose aggregate capacity was estimated at 152,000,000 tons and which employed 192,000 men, to the record figures of 1918, when the output was 579,000,000 tons, the mine capacity approximately 715,000,000 tons, and the mine workers numbered 615,000.

Analysis of the records over the 30-year period 1890–1920 shows that coal output and labour employed during this period increased largely, and that the production of the average mine-worker was greater. Output fell off, however, in the years of general business depression—1894, 1904, 1908, 1911 and 1914. Mine capacity kept well in advance of output, largely because of ever-increasing expenditures in mine equipment, which also largely account for the increased average production per man underground from 579 tons in 1890 to 1,134 tons in 1918.

The considerable time lost in the soft-coal industry is shown by the fact that in only seven of the years during the period from 1890–1919 was lost time less than 25% of the working year. That coal-mines are idle for many days in the year is familiar to everybody acquainted with the industry; but what is not generally realized is the amount of time lost. During the 1890–1919 period, out of 308 possible working days a year, the bituminous mines were idle on the average 93 days. Ten times during that period the time lost exceeded 100 working days. The greatest loss was in 1894, when the average for all mines was 137 days, or 44% of the working year. The smallest loss occurred in 1918, the year of record production; yet even then the mines were closed down for one cause or another for the equivalent of 59 days out of 308—nearly one-fifth of the time. These figures for lost time indicate only the days that the mines were not operated. Absenteeism of a part of the force when the mines were running still further reduced the output. The greatest extremes in output occurred in 1914, when the rate of production rose in March to 123% of the monthly average for the year and fell in April to 66%. The high rate was nearly twice the low. In that year two influences were at work: the normal seasonal fluctuation was intensified and distorted by the biennial wage negotiations. The normal April slump was aggravated by strikes, in anticipation of which there had been anxious buying in March. The year 1914 may be taken as a somewhat exaggerated example of the fluctuation to be expected in an "even" year—the year of biennial wage adjustment. In one respect, however, 1914 was not typical. The autumn peak came in Sept., and was followed in the last quarter of the year by a depression which was one of the effects of the outbreak of the World War. In other years the peak was reached in November.

When monthly fluctuations represent seasonal fluctuations in demand only, uninfluenced by labour disturbances, as in 1913, such a year may be accepted as a fair type of the "odd" year in local production, when the biennial adjustment is not a factor. In such a typical year the capacity required during the month of maximum demand will be from 35 to 40% greater than in the month of minimum demand. In other words a mine capacity and a labour force sufficient for Nov., if working full time, would be employed in April only 70 to 75% of the time; and as in actual practice the mines never attain 100%, or full time, even in Nov., but under the very best of conditions reach only 80%, the time of employment to be expected during April is about 59%. Rate of mining in April 1919 was only 50%, or 24 hours out of a 48-hour week. The highest weekly percentage of full time averaged by full-time bituminous mines was 86·8, during July 7–13 1918. The average for that particular month was 84·4. In Sept. 1918 an average of 84·9% was reached. In Nov. 1917, however, when the demand was intense but the zone system and other features of wartime control of distribution were not in force, the percentage averaged was only 75·3. To put it in another way, even in years of active demand the inequalities in the summer and winter buying of coal render inevitable a long period in which the labour and capital engaged in the industry cannot work more than 27 to 30 hours out of a 48-hour week. This is not the measure of working time necessary to meet demand. The 30-hour week is almost invariable during springtime in the bituminous coal industry.

Under the conditions obtaining in 1920 there was a third set of fluctuations in addition to the annual and seasonal fluctuations in production. The railways work seven days a week; the mines only six. Over Sunday the carriers catch up in their work of placing cars, and in consequence of the better car supply the miners work longer on Monday, but later in the week their hours show a gradual decline, accentuated on Saturday by holiday absenteeism. Even if the mines should obtain full time on Monday, which in practice they never did, they could not expect to work more than 86% of the time on Friday and 79% on Saturday. But the Monday rate never in practice gets up to 100% and the performance on the latter days of the week is correspondingly defective. A significant, if rough, relation exists between the loss of working time in the soft-coal industry and the degree of unionization. Those bituminous

regions in which interruptions were most pronounced showed a tendency to become union territory. The presence of the union is both cause and effect. Wage disputes cause lost time, but on the other hand, irregular employment is a prime incentive to unionization. Full-time operation, if it could be brought about, would reduce production costs per ton. Careful investigation of many mining operations disclosed that the cost of mining varied as much as 60 cents a ton from one month to another, depending on the number of idle hours. A coal-mine differs from a factory, which when closed needs only a watchman to guard it. In an idle mine the forces of nature are busy: there are roof and floor movements that change the haulways; there are gas exudations and inflows of water with which to contend. An idle mine cannot be left unattended, without heavy loss. In mining the costs go on even if the coal is not produced.

At the end of 1920 experts agreed that there was no prospect of a return to pre-war prices because of the larger difficulties of mining less favourable seams, more costly equipment, higher wages and increased freight rates. These changes seemed likely to cost the people of the United States upward of a thousand million dollars annually as compared with the fuel bills of 1914. During the period 1900-20, the population of the United States increased 42%, and the consumption of coal 172%. Mechanical means, more and more employed to do work formerly done by hand, consumed more power, and coal was the chief source of energy. Assuming that the population and industrial growth of the United States continue unchecked, and that the use of coal increases accordingly, by the year 1940 the United States will be consuming 1,400,000,000 tons of coal annually. It would be wholly impossible for the system of American railways as constituted in 1920 to handle any such production and at the same time carry the normal increase of other freight. It appeared essential, therefore, that immediate thought be given to the important problem of a national power supply.

There were in 1920 about 8,000 commercial or shipping mines producing bituminous or anthracite coal in the United States, and about 12,000 "wagon mines," or "country banks," supplying local trade. Kentucky, West Virginia and Ohio had the greatest number of these small openings. Though the total production of these country banks was less than 1% of the total output, the effect of dumping their unprepared and inferior product on the general market was not desirable, and as a miner can produce from two to four times as much coal in a properly developed colliery as in the average wagon mines, the effect on the labour situation was adverse.

The whole American coal industry in 1920 employed 750,000 men in and about the mines. The operations in the Appalachian fields, from the Tennessee-Kentucky line N. into Pennsylvania, furnished the bulk of the bituminous coal used in New York and New England. The Appalachian region also provided all the bituminous coal exported to Canada. Consumers required shipments of at least 28,000,000 tons monthly from the mines. In winter all this output was consumed as fast as produced, but in summer consumption dropped to approximately 24,000,000 tons a month. The remainder, about 4,000,000 tons a month, normally served to build up winter stocks in New England, the north-western states and Canada. An analysis of coal production in the United States by periods and decades from 1807, and by years from 1908, is given in the annexed table in short tons.

The table illustrates the great increase of American industries, which absorb nearly all of the bituminous production. Gauging the industrial development of the different nations by the *per capita* consumption of coal, it is interesting to note that in the United States the annual consumption *per capita* in 1920 was six tons; in the United Kingdom it was estimated to be 5·1 tons; in Germany 3·4; France 1·2; Italy 0·34; and Russia 0·18. Before the outbreak of the World War in 1914, Belgium was consuming about four tons of coal *per capita*, which indicated its intense industrial development. While the output of European nations steadily decreased in recent years, the production of the United States increased. American mines in 1918, as shown by the table below, under stress of war demands broke all records, producing nearly 600,000,000 tons of bituminous coal. The average production per man during that year was 1,134 short tons. The closest competitor was New South Wales, where each underground worker in 1918 produced 814 tons. British Columbia ranked third with 790 tons, and Nova Scotia fourth with 718.

Mining machines played an important part in the development of coal-mining in the United States in the period 1910-20. In 1918, 18,463 machines were in use in the bituminous mines, an increase of 1,228 over 1917, and 2,265 over 1916. The tonnage mined by machine in 1918 was 323,931,000, an increase of 17,535,000 tons, or 5·7% as compared with 1917. No great change occurred in the proportionate machine output for 1920, because the intense demand called forth a large production by hand as well. In 1916 the proportion of the total output mined by machines was 56·5%, in 1917 it was 55·5% and in 1918 59·9%.

Of the annual bituminous production in the United States in 1920, 40% was used for steam or industrial purposes, 27% was burnt by the railways, 15% was used for household purposes and the remaining 18% consumed in coking, exports, smithing, gas-houses and bunkering. Assuming that it is possible to obtain the by-products from only 25% of the industrial coal and from 50% of the railway coal through establishing control stations and electrifying, also that all the household coal can be coked first (which could be done if modified ranges and furnaces were used), it has been calculated that 195,000,000 tons of bituminous that in 1920 was burned raw in the United States should have been coked. If but two-thirds of this tonnage could have been subjected successfully to by-product coking, the saving would have amounted to at least $238,000,000. In other words, more than $200,000,000 went up in smoke from American plants in a year. Production of coke in 1920 was nearly 57,000,000 tons. Of this quantity approximately 30,000,000 tons were produced in the old-fashioned beehive ovens and the re-

Years (Inclusive)	Pennsylvania Anthracite	Bituminous	Total	Period Totals

**Estimated*.—Bituminous coal in the United States is mined and sold in short or "net" tons. Anthracite is mined and sold in long tons. The figures in the table for anthracite have been reduced to net tons to make them correspond to the bituminous figures.

NOTE.—Anthracite production exceeded bituminous until after the Civil War. After that time it became less proportionately, from year to year. In 1908 bituminous production had become about four times as great as anthracite, and in 1918 it had become nearly six times as great.

maining 27,000,000 tons came from by-product ovens. The maximum capacity of the by-product plants of the United States has been estimated at 27,000,000 net tons of coke at the beginning of 1908, 33,700,000 at the beginning of 1919, and 39,500,000 at the beginning of 1920. These estimates were based on 100% operation. In actual practice, however, an average operation above 90% cannot be assumed; and for the country as a whole 85% is a safer figure. This would show the capacity for 1920 to be 33,575,000 tons.

Estimated according to the quantity of by-product coke produced in 1919, 25,171,000 tons, by-products recovered during that year were 668,200,000 lb. of ammonium sulphate or equivalent, 251,000,000 gal. of tar, 84,800,000 gal. of crude light oil, and 367,700,000 cub. ft. of gas. The largest by-product coke plant in the world in 1920 was that of Clairton, Pa., owned by the Carnegie Steel Co. This plant carbonized 12,500 tons of high volatile coals daily, producing 8,000 tons of metallurgical coke, 150 gal. of coal tar, 75,000,000 cub. ft. of gas, 40,000 gal. of light oil and 174 tons of ammonium sulphate each 24 hours. The comparative production of these resultants varies in different parts of the country.

In contrast with the reserves of coal in the United States and the annual production, the exports in 1913 (a normal year) were only about 12% of the exports of coal from all other countries; and a large part of the American exports went to Canada by rail. Of sea-borne coal, the United States sent out only about 4%. This small proportion of over-seas trade was due to the distance of American coal from seaports, the lack of organization among operators and among related shipping organizations, and further, to the relative independence of the United States, which could utilize only a small amount of imports from most countries as a return cargo for coal-exporting ships. Most of the American coal was used at home, but the advantage of exporting a considerable quantity of coal, for its effect in increasing trade relationships with other countries, was becoming more manifest. During a part of the autumn of 1919 the United States exported coal at the rate of 65,000,000 tons a year. This was practically every pound of coal that could at the moment be loaded into ships at the Atlantic ports. The total coal-loading capacity of all the Atlantic coast export docks was about 31,000 tons per 10-hour day. It was this limited coal-handling facility which militated to a large extent against the United States gaining a permanent position as the world's leading coal export nation.

The war opened several foreign markets, especially in South America, to U.S. coal. The United States had coaling stations as far away as the Samoa Is. and Manila, but little coal reached them from America. American coal supplied the Government coaling stations in Alaska, Hawaii, the home ports both Atlantic and Pacific, Cuba, Porto Rico, Nicaraguan ports, Panama Canal ports, Mazatlan (Mexico) and South American ports.

U.S. Government Control, 1917–20.—On April 6 1917 the United States entered the World War, and centralized wartime control over the coal industry was delegated by President Wilson, in May 1917, to an officially constituted Fuel Board, with Francis S. Peabody, a practical coal operator, as chairman. Soon after the formation of the Board, plans were announced for the stabilizing of coal prices, the collecting of production statistics, and the efficient distribution of coal.

The Fuel Board acted as a kind of clearing-house, collating and digesting the vast mass of information needed. In June 1917 labour was given representation on the board, and the way thus smoothed for more efficient coöperation between the board and the mine workers. Keenly desirous of efficiently handling the coal situation, the Federal Trade Commission, through the Fuel Board, made recommendations which created surprise, as no such drastic measures had been expected. In essence, the most important of these recommendations were:—First, the institution of a pooling arrangement, to be placed in the hands of a Government agency, to control the production and distribution of coal and coke. The producers were to be paid their full cost of production plus a uniform profit per ton, with due allowance for quality of product and efficiency of service. Second, all agencies of transportation, by both rail and water, were to be similarly pooled and operated on Government account, as a unit, under direction of the President. The owning corporations were to be paid a fair compensation, which would cover normal net profit, upkeep and betterments.

In the latter part of June 1917, after conferences with the coal operators, the Fuel Board (then known as the Committee on Coal Production) made sweeping reductions in the current prices of bituminous coal, which had been showing a tendency to rise to unheard-of levels. Early in these conferences it became apparent that a national organization of coal operators would be necessary to carry into effect the price-fixing and other plans of the Government. A tentative organization was formed, composed of the secretaries of the 25 coal-trade associations which were represented at the sessions. C. P. White, of Cleveland, was chairman of this new body, and C. E. Lesher, statistician of the U.S. Geological Survey, was secretary. The association was to work in conjunction with Mr. Peabody's committee, and to be supported by an assessment not to exceed one-quarter mill per ton, levied on all operating coal companies in the United States. By Aug. 1 1917 the pooling arrangement suggested by the Federal Trade Commission was in full operation. All shippers of tidewater bituminous coal had agreed to pool their output at the ports of New York, Philadelphia, Baltimore and Hampton Roads. The regulations fixing maximum prices for coal, announced by the Committee on Coal Production, were carefully observed by the coal operators, although the new figures had been characterized as "unjust" in some quarters and as "exorbitant and oppresive" by Secretary of War Baker, who wanted cheap fuel for the navy.

The prices set by the Committee on Coal Production were short-lived, for on Aug. 21 1917 President Wilson took price-fixing into his own hands and prescribed provisional prices to cover all the bituminous-coal-producing districts of the country. The new figures were one-third lower than those agreed upon voluntarily by the operators in concert with Mr. Peabody. The announcement of the new prices stated that they were based upon actual cost of production and were deemed to be not only fair, but liberal. Provision was made, however, for a reconsideration "when the whole method of administering the fuel supplies of the country shall have been satisfactorily organized and put into operation." All the coal operators in the United States were called upon by the Board of Directors of the National Association of Coal Operators to meet Aug. 29 1917 at Pittsburg, to discuss the latest ruling.

Soon after the President's announcement fixing the prices of soft coal, came the setting of prices of anthracite coal, the specification of the margin of profit that could be charged by a jobber and the naming of a coal controller. In a fifty-word statement, President Wilson announced that, in accordance with an Act of Congress approved Aug. 19 1917, he had appointed Harry A. Garfield, president of Williams College, as his fully empowered representative on control of fuel.

The new schedule of coal prices had no appreciable effect on anthracite, though it threw the bituminous trade into confusion. Practically all coal disappeared from the market, and delegations from all parts of the country rushed to Washington in an endeavour to have the prices on bituminous coal increased. Dealers who had purchased stocks of coal at prices considerably above the latest Government figures were in a quandary. On Sept. 8 1917 Mr. Garfield made public his plans for controlling retail prices of coal by the formation of local fuel administrators in every coal-consuming section of the country. Soon after, intimations came from Washington that the President's provisional prices for bituminous coal would be increased, as the original schedule had tended to decrease production. In the autumn of 1917 the educational department of the Fuel Administration, in the daily press and in circulars, posters and pamphlets, began to preach economy to both domestic and industrial coal consumers. Industries that were not strictly necessary to the winning of the war became apprehensive as to their future coal supplies. Through the fall of 1917 the demand for both anthracite and bituminous coal was urgent, and many sections of the country were in dire straits for want of soft coal. The price of bituminous had been increased 45 cents meantime, the advance being made to cover the increase in the miners' wage scale that had gone into effect.

By Dec. 1917 it became evident to those in the coal industry that the Fuel Administration would brook no interference with its plans. The personnel of the Administration had been growing since its inception, and there were organizations in most of the states of the Union. With the coming of the exceptionally cold

winter of 1917–8, came more urgent demands for coal from all classes of consumers. New England in particular was in distress, and large cities such as New York could get but little hard coal for heating. The great tonnage which the railways were called upon to handle congested the yards, terminals and equipment so that it became impossible to supply quickly even the most vital needs. Embargo followed embargo, and preferential shipment orders for sundry commodities further hampered transportation. Dr. Garfield stated that adequate coal supply depended in large measure upon more ample transportation. Every soft-coal operator reported a shortage of coal-carrying equipment, and although the clamour for relief was loud and long, no one seemed to know just what steps to take to ameliorate this condition.

The attempt was then made to deal with the problem by conservation. Estimates by the fuel authorities indicated a shortage of at least 50,000,000 net tons of bituminous coal. As there seemed to be little likelihood of output catching up with demand, reliance was placed on securing less waste of coal in large plants and in curtailing unnecessary uses of power. David Moffat Myers, advisory engineer of the Fuel Administration, in consultation with conservation committees and engineers, formulated a plan to reduce fuel waste in power-plant operation, not by costly installations of more efficient apparatus, but by a more intelligent and careful use of existing equipment. It was proposed to ascertain first how far each plant complied with certain well-recognized standards in its operation and maintenance, and then, by a system of rating degrees of efficiency, to force on the attention of the plant management such wasteful conditions as were disclosed. To supply a strong incentive for improvement, it was announced that the relative rating of plants would influence the Fuel Administration's allotment of coal should a shortage occur. The plan further included a programme of education through lectures, Government publications, meetings of plant owners, engineers and firemen. This campaign in each state was to be in the hands of an experienced power-plant engineer who, with his staff of workers, should be a part of the conservation division of the state Fuel Administration. Printed "Recommendations of the United States Fuel Administration" were issued establishing the standards of plant operation and maintenance as well as a questionnaire to ascertain from the power-plant owner the condition of his plant with relation to these recommendations, and to obtain the initial information for rating. It was an essential part of the plan that this information be confirmed or amended by an accredited inspector after investigation of the plant itself.

As a climax to Dr. Garfield's frequent statements, that the railways were chiefly responsible for the deplorable situation, came the proclamation by the President on the night of Dec. 26 1917, by which the Government took over the railways. At this time the efforts to relieve congestion on the railways were beginning to bear fruit in the shape of a slight improvement in the car supply at the mines. On Jan. 16 1918 came the order shutting down business for five days and closing up industries on every Monday until March 25. The storm of protest which this evoked was far louder than any that had greeted the other revolutionary edicts of the Fuel Administrator. There had been no advance notice of the order, and following its publication the U.S. Senate, with only 19 adverse votes, passed a resolution, introduced by Senator Hitchcock, requesting a five-day suspension of the order to allow those opposing it to be heard. Nevertheless, the order was obeyed with a promptness that clearly showed the resolution of the public. On Feb. 13 1918 the order providing for "heatless" and "workless" Mondays was suspended. Although it was admitted in official circles that little coal had been saved by the order, it was generally acknowledged that it had stimulated the railway managers and had relieved to some extent the freight congestion.

After months of preparatory work, the Fuel Administration on March 22 1918 announced a zoning plan for the distribution of coal, to take effect April 1 1918. Every state in the Union was affected more or less. The aim was to confine coal produced in the eastern section of the United States to eastern markets, and make it compulsory for states in the Middle West, as well as in other sections, to use coal produced in mines near by. The announcement was received by the coal-mining industry with mixed feelings. Many operators and shippers who had spent years in building up their trade suddenly found their best customers taken from them. Consumers who had been accustomed to burning certain kinds of coal were forced to use fuels with which they were less familiar. But producers and consumers alike readjusted their methods to conform to the new order of things. The coal trade was still further convinced that the Government intended to control the entire output of fuel, from the time it left the mines until it was in the consumer's bin, and even in the furnace, when Dr. Garfield on April 1 1918 announced that coal jobbers must procure licences. Many abuses had arisen which the Government desired to eliminate, and the licensing plan was announced as fair to the operator, to the *bona-fide* jobber and to the consumer. The new system enabled the retailer to buy direct from the producer, whereas he had before been able to deal with the jobber only.

With the railways under its control, the Government had made material progress in the task of clearing the path for a quick movement of coal from mine to consumer. New prices had been announced, and the local fuel administrators had perfected their organizations to take care of distribution. In many producing districts the car supply was still below normal, however, and not sufficient motive-power was available. The railways had shown little improvement in the method of allotting empty cars to the mines. Before the Railroad Administration assumed control, it had been the practice of some railways to allot cars to those operators on their lines who favoured the carriers in respect of prices. John Skelton Williams, in charge of purchases for the Government-controlled railways, insisted that the Railroad Administration had the right to distribute cars where and how it pleased. This was a continuation of the old policy of using such control of shipping facilities as the railway possessed to force concessions in price from the coal producers, and it was in direct antagonism to the Fuel Administration's endeavour to further the production of fuel. Thus one Government body set at naught the edicts of another.

This action on the part of the Railroad Administration served as did nothing else to bring to the support of Dr. Garfield many of the coal operators who had been inimical. With the warmer weather of May 1918 came admonitions from the Fuel Administration that consumers would best serve their own interests, and those of the nation, if they laid in their winter coal supplies during the summer. The production of both anthracite and bituminous coal had been steadily increasing, though inadequate car supply still prevented a maximum output of the latter. By June 1918 it had become apparent to those interested that the coal industry was being organized as it never had been before. The Fuel Administration, under Dr. Garfield, was accomplishing the seemingly impossible. Weekly reports kept him conversant with the actual output and consumption of coal in each zone, and a watch was kept on the needs of each section. Coal was in many instances diverted in transit to provide for emergencies. Quotas had been fixed for cities that were permitted to burn anthracite, none of which was to be sent west of the Mississippi or south of the Potomac or Ohio rivers. Industries deemed unessential to the winning of the war were being denied the use of any kind of coal. By July 1918 the coal industry was hard and fast in the grip of governmental regulations and administration. Competition had ceased. The railways and the fuel authorities were working together in harmony, and the bituminous mines, under the stimulus imparted by Dr. Garfield's newly formed production bureau, were producing record tonnages. The difficult task of inciting the soft-coal miners to greater endeavours was placed in the hands of James B. Neale, who had been acting as adviser to Dr. Garfield. In Aug. the Department of Labor classified coal-mining as "war work," in order to keep the

miners from leaving their tasks for other war industries, such as munitions and shipbuilding, where higher wages prevailed.

Conditions in the latter part of Aug. 1918 were about as follows:—That part of the United States lying roughly between the Rocky and Allegheny mountains appeared to be fairly well supplied with fuel, though Michigan was complaining of a shortage of domestic coal. The scarcity of coal seemed to be worst along either coast. New England, while admitting that coal was coming forward in adequate volume for immediate needs, nevertheless was apprehensive as to the future. On the Pacific coast, industries were somewhat short of fuel; although little anxiety was felt, it was anticipated that wood and other fuels would have to be used there during the winter. By the middle of Oct. even the most carping critic was forced to admit that Federal control of the coal industry was beneficial. In charge of all production and distribution facilities, the Fuel Administration had carried out many of the plans which it had formulated early in the year. In the face of apparently insurmountable obstacles and of bitter criticism from many quarters, Dr. Garfield and his assistants had laboured steadily until disorder had given way to order. New England and a number of other important industrial centres had ample reserve stocks of fuel against the uncertainties of mining and shipping conditions in winter, a complete reversal of the conditions that obtained in the autumn of 1917, a year earlier.

The need for quantity production of soft coal being less urgent, the Fuel Administration again turned its attention to quality. During the week ended Oct. 28 1918, orders were issued to a number of bituminous coal miners prohibiting them from mining or shipping their product, as it was of an inferior quality. The Fuel Administration closed down 99 mines in its campaign for clean coal. Early in Nov. 1918 a surplus of soft coal was reported from practically every mine west of the Mississippi river, this unusual condition being attributable largely to the expectation of an early peace which led manufacturers of war goods to stop buying coal, and partly to exceptionally mild weather throughout the country. On Nov. 11 1918 the signing of the Armistice practically ended the activities of the Federal Fuel Administration. Government control of prices and other regulatory measures of the Fuel Administration were suspended Feb. 1 1919, but control of the coal industry was again established Oct. 30 1919, when all regulations were restored, in order to deal with the results of a strike in the soft-coal fields. These regulations continued in force until April 1 1920, when the coal industry was returned to its owners.

Apart from the phases of the conservation work carried on by the Fuel Administration as already described, other fuel-saving plans and recommendations were either discussed or put under way. These activities may be classified as follows:—

Interconnexion of power plant.—This meant that municipal electric plants should connect with central stations; that isolated office-building plants, as well as industrial plants, should shut down and take power from central stations; and the interconnexion of hydro-electric plants with steam electric plants.

"*Skip-stop.*"—Many street-railway companies of the United States adopted the "skip-stop" system for the saving of fuel by passing many streets without a stop; steps were taken to decrease coal consumption by automatic control of heat on cars and by the elimination of unnecessary street-railway service.

Industrial gas.—The managers of foundries and other industrial plants in sections of the country where artificial or natural gas was available, were induced to substitute this form of fuel for hard coal or coke. Many restaurant proprietors and bakers were persuaded to abandon solid fuel for gas.

Domestic heating.—Although domestic heating consumed only a small portion of the total coal output, methods of burning fuel in domestic heating equipments were improved, and faulty installations were corrected.

Wood fuel.—Various local Fuel Administrators devoted themselves to ascertaining where dead timber was obtainable and, through women's organizations, boy scouts, and other volunteers, this fuel was sawed and distributed, taking the place of coal.

Lighting restrictions.—The use of electric illumination for display purposes was curtailed.

Efforts in the direction of conservation ran from the smallest consumer, who carried his coal home in a pail, to the huge coal-consuming corporations in the large industrial cities. What the Federal Fuel Administration accomplished cannot be accurately measured in terms of coal saved, though it may be stated that it amounted to many millions of tons. (F. W. P.)

COAST DEFENCE (*see* 6.599).—Broadly, the term "coast defence" might be said to include all military and naval measures taken to defend the sea-margin of a country against any attack by an enemy conveyed by vessels on or under the surface of the water. But the usual military meaning is a much narrower one, and may be taken to denote only the fixed defences of a coast and their various accessories. Even this requires qualification. Unless the sea-margin be a very short one it is not practicable to defend it efficiently by any defences tied down to the coast-line concerned. The cost in men and material would be very great, and the whole, being rendered immobile, would be incapable of use in any other part of the theatre of war. So far as these forces were concerned initiative would always rest with the enemy who could attack or not as he liked. Victory lies with the attack and not with the mere parrying of a blow. Therefore, any country desiring victory must be prepared to strike, and for this reason must limit purely passive defence to its minimum; and defences tied to a coast are purely passive.

It is true that a country with very weak naval forces often tends to increase its coast defences as compared with another power possessing a strong navy. But even here this tendency should be carefully limited. The hostile navy will hardly ever be able to compel victory by itself; land operations will be necessary, and every effort should be made to conserve energy to combat these. The real defence of a coast, in the plain English of the words, lies in beating the enemy. The numerous coast guns on the east coast of the United States of America never fired a shot in the Spanish-American War; that coast was defended at the naval battle outside Santiago de Cuba. Practically then it may be said that coast defence, in the present military acceptation of the words, refers to the fixed defences at certain limited portions of a coast which, as will be seen later, are vital to the whole general fighting scheme of the country.

This view in its entirety has not always prevailed either in England or in other countries, and it may be said that the modern British scheme of coast defence has only been accepted since about 1885. Some years earlier the so-called Palmerston Commission, which commenced its sittings in 1859, had carried out a very large scheme of coast fortification which, although it concentrated the defences at certain important harbours, still was so far imbued with the ideas of the past that it caused its works to be much too heavily gunned, and so locked up too many men and too much material.

Starting with the experience gained at the bombardment of Alexandria in 1881 the British school of thought on coast defence, as it existed before the World War, gradually took shape, and its ideas were crystallized largely owing to the influence of Sir George Clarke (Lord Sydenham).

The World War has naturally caused changes in this as in every branch of the military art. Opinions are expressed to the effect that the whole scheme of coast defence must be radically changed, owing to the theory that surface craft are practically doomed and that the weight of a future attack will come from the air or under the water. This is almost certainly to anticipate the future too rapidly. The use of aircraft and the expansion of the use of the submarine boat have undoubtedly caused great changes. But they are *changes* and not *revolutions*. History shows that no inventions in the past have ever caused sudden revolution in the art of war. It will be found that the new arm or the fresh invention take their places in the armoury of war alongside of, but at first not in place of, what has gone before. In time the old weapon may be discarded altogether, but sometimes this does not happen. In the matter under consideration surface craft must always be used for ordinary commercial purposes, as less energy is required to move a given mass floating on the water to what is necessary to move it in the air or completely submerged in the sea. These surface craft being in existence will certainly have to be used in warfare. Also, the

present stage of mechanical engineering, advanced as it may be considered to be, hardly warrants the belief that a surface war fleet, with all which that implies, can be completely replaced now by aircraft or submarines or a combination of both. The art of war is constantly changing, but by a gradual progress, and many of the old views *with modifications* will be found to be sound in the future as in the past. Amongst these it is contended that the basic principles underlying British schemes of coast defence before the war will be found to have been of this sound nature, and only require modification in detail.

In order to understand these general principles it is necessary to consider the whole question of the contest between the ship and the shore defences, the main element of which is artillery. These two contestants have never been on an equality, and that for various reasons which may be briefly recapitulated:—

(1) *Gun Platform.*—The shore gun is on an immovable platform while the naval gun is not. It may be taken that a shore gun presents a vertical target of about nine feet. This subtends an angle of slightly over 30 sec. at a range of 20,000 yards. Assuming a naval gun correctly aimed at the centre of this target a movement of the gun of 15 sec. in the vertical plane containing the trajectory of the shell at the moment of firing would be sufficient to throw the gun off the target. Such a movement is almost imperceptible on a ship.

(2) *Control of Fire.*—On a ship the means of range-finding are necessarily restricted within the dimensions of the ship and its masts, while the shore gun has the whole coast within the limits of vision to use for purposes of bases for range-finding. It is true that in these days aircraft can be used for correcting fire, but the results of this are not so accurate as those from terrestrial instruments, and in any case aircraft can be used by both sides.

(3) *Ammunition.*—The supply of ammunition of the shore gun is naturally kept up more readily than that of the gun afloat.

(4) *Visibility of Target.*—So long as a ship is within the horizon it cannot conceal itself except by means of a smoke screen. This latter has disadvantages from the point of view of offensive action from the ship. A shore gun on the contrary can be rendered very inconspicuous, and in many cases may be invisible from the sea behind a fold of the ground, using indirect fire.

(5) *Target.*—Apart from the visibility of the respective targets their vulnerability differs. It is not difficult to design a shore battery so that only a direct hit on the gun itself will put it out of action, all other parts of the battery being fully protected. At Tsingtao on Oct. 29 1914 ten large shell from H.M.S. "Triumph" were observed to burst just inside Fort Iltis, but none of the guns of the fort were damaged. With the ship, on the contrary, there are many parts, other than the guns, damage to which would materially affect its fighting efficiency. Examples of this occurred on March 18 1915 in the Dardanelles.

To a certain extent these unequal conditions have always existed, but when they are examined it will be seen that the increase of power of artillery and improved methods of range-finding tend to put the ship's guns more and more at a disadvantage. When the effective range of artillery was about 1,000 yd. it was very difficult to make anything inconspicuous on shore, and range-finding instruments did not exist at that time. In these days of ranges of 30,000 yd. and more, shore guns become practically invisible from a ship even if they are in direct view from the sea, and range-finders may be situated several miles away from the guns they serve and give no indication of their presence. It is true that with modern ranges it cannot be expected that shooting can be very constant; there are too many factors to prevent it. But this fact is at least as disadvantageous to the naval gun as to its rival on shore. Guns are not mathematical instruments. Their shooting powers are affected by very slight variations of propellant charge in quality and in quantity, of weight of projectile, of the amount by which the latter is rammed home in the bore, and by the wear of the gun itself, not to speak of change of atmospheric conditions and wind. The Battle of Jutland brought out the fact that a large number of shell are required even to hit a ship, and still more would be needed to hit such a target as a shore gun.

In one other point also modern ships are at a greater disadvantage than their predecessors in a contest against shore batteries in the fact that they possess a smaller number of guns. If it be granted that a direct hit is necessary to put a shore gun out of action then the more guns which are available to fire at it the greater the chance of hitting. During the World War a number of British monitors were built and used for bombarding the German batteries on the Belgian coast. While they possessed many advantages in their design which tended to render them less vulnerable, they had the grave disadvantage of an armament small in number.

Except in special cases ships are built to fight other ships and not to fight coast batteries, and it would seem to be admitted now that naval fire can never be effective against such small targets, and that it is better to reserve it, in action against the shore, for firing upon areas such as docks or dockyards.

If a fleet was determined, regardless of loss, to come to really close quarters with coast defences, some of the advantages of the shore gun would undoubtedly be minimized. But the superiority of the land range-finder would render such an operation in day-time extremely hazardous to the fleet, apart from any action by submarines on the part of the defender, while at night it is difficult to see what object could be attained, apart from such a special attack as was carried out at Zeebrugge.

Very many actions have been fought between ships and batteries, and a few of the most instructive may be mentioned here.

At Eckernförde in April 1849 a Danish fleet consisting of one battleship, three lighter vessels and two steam gunboats attacked the Prussian defences, which comprised two batteries containing two 8-in. guns, two 24-prs. and six 18-prs., assisted by one field battery and three battalions of infantry. The batteries were near the water's edge on low sites. After a long action at short ranges, the battleship and one frigate surrendered and the remaining ships retired, all having suffered severely. The casualties in the batteries were one gun temporarily disabled and ten men.

One of the most instructive instances in the past was the naval attack on Sevastopol in 1854. There the British in-shore squadron of five large ships engaged three works—Fort Constantine, a large masonry-casemated fort with barbette guns on the top, which rose from the sea at the mouth of the harbour; a small brick fort called the Wasp battery, on a cliff 110 ft. high; and the Telegraph battery, an earthen one on the same cliff, the two latter works having five guns each on the sea front.

From a range of 800 yd. 22 out of the 27 barbette guns of Fort Constantine were silenced in a very short time by the fire of three ships, the splinters from the stone walls causing a great deal of damage. But the other two batteries caused the retirement of the whole squadron with considerable loss, while they themselves suffered very little, the Wasp battery having one gun upset and 22 men wounded while the Telegraph sustained no loss at all.

In the action at Alexandria in 1882 the conditions were almost wholly in favour of the ships, namely, smooth water, works not only on very low sites close to the water but badly designed, a poor armament and inexpert gunners; yet the shooting of the ships had little real effect, and against better troops the fleet would hardly have gained its object. This was due, no doubt, principally to the nature of the naval armament, which consisted to a very large extent of slow-shooting heavy guns, few in number, while the shore guns were well dispersed.

When the World War began it was sometimes argued, as it had been argued in past periods, that present-day naval artillery is so powerful that it would reverse the lessons of the past. But the experiences of the war have only emphasized those of its predecessors.

A long series of engagements took place between British ships and the batteries erected by the Germans on the Belgian coast. The number of these actions was at least 40, and yet no gun, mounting or magazine of these numerous batteries was ever hit.

In the naval operations in the Dardanelles, on March 18 1915, a deliberate attack was made on the main batteries of the defence near the Narrows by 16 battleships, at the comparatively short ranges of from 10,000 to 14,000 yards. The Turkish batteries and guns were old, the works were badly sited, as a rule close to the water, and their high traverses rendered them very conspicuous. At the end of the day three battleships had been sunk by mines and three others so badly damaged by shell-fire as to necessitate immediate withdrawal to a dockyard.

The damage to the batteries was very small. For instance, the old Hamidie I. battery near Chanak, which contained three 14-in. and six 9·2-in. guns, had one of the latter put out of action and suffered some losses in its garrison. A war-time battery of five 6-in. guns at Dardanos, near the top of a conspicuous hill some 150 ft. high, received a large amount of attention, but the only result was that three gun-shields were dented by splinters.

A general summary having been given of the conditions of the combat between ships and shore batteries in the past, the point next to be considered is what are the objects to be attained by coast defences to-day.

In order that the navy shall be free to carry out its true function of attacking the enemy's naval forces and keeping clear the ocean lines of communication of the country, it must not be

hampered by having to think of guarding its own bases against any attack likely to be made on them. If it had to do this its mobility would be lost. Naval bases, where ships can renew their fuel supplies, ammunition and stores of all sorts, and where they can repair damage, must be self-protected. Similarly, it is advantageous that certain commercial ports where a country receives large overseas traffic or where convoys are assembled for dispatch should be self-protected. Also, for strategical reasons certain harbours should be self-protected, where naval squadrons can lie at ease without jeopardizing their own safety or risk being caught like rats in a trap.

It is at ports of the above description that "coast defences" find their real use, and while, as stated above, such defences should be kept down to a minimum, they must be capable of doing their protective work effectively. The necessary scale of defence will vary with every nation; and, with the far-flung possessions of the British Empire and any country with overseas dependencies, the requirements will vary in every case. Many factors must be taken into account. The strength of the naval forces of the country in question, the strength of the naval forces of any possible enemy, the geographical position of the harbour in consideration with respect to the enemy and with respect to the main forces of the country to which it belongs—all these points must be duly weighed in deciding on the scale of defences to be adopted, as well as the particular rôle which the harbour is intended to fill in the general fighting scheme.

Fixed defences may be said then to form a part of the scheme for utilizing the naval forces of a country, and it has been argued that these defences should be manned and controlled by the navy. In a few countries this is the practice, but in the majority it is not, and it would seem that the latter are right for the following reasons: the service and control of artillery afloat differs greatly from those of artillery in coast batteries; the use of artillery in such batteries is not very different from that in heavy batteries in land warfare. Therefore it would seem advisable to have coast batteries manned by land gunners and not by naval gunners. History has shown that the defences on the land side of a coast fortress are often the door by which an enemy seeks to enter, *e.g.* Sevastopol, Port Arthur, Tsingtao, and the Dardanelles in the World War. These land defences are very intimately connected with the fixed coast defences and also with the field land forces, which must form a part of the army and not of the navy. It is evident then that in the general scheme of defence of a defended port there must be some line of demarcation between naval and military control, involving the closest coöperation between the two wherever that line of demarcation is drawn. For these reasons alone it is argued that the proper line of demarcation should be that provided by nature, namely, the edge of the sea.

Adaption of Coast Defences to Local Conditions.—While coast defences will vary according to the scale on which they are based, they will also vary according to the local conditions of the place to which they are applied. These local conditions, apart from topographical considerations, fall into three main classes: (1) Defence of a harbour; (2) Defence of a channel; (3) Defence of a landing place. The greater number of cases will come within the first class.

(1) *Defence of a Harbour.*—This may be a naval port, a commercial harbour or a strategical anchorage. The scale having been determined upon, the coast defences necessary will depend upon the different forms of attack to which the harbour may be exposed. Attack on the land side of the harbour by forces landed outside its rayon is omitted here, as it is a branch of land warfare and is dealt with elsewhere. It is sufficient to remark that in the past this has often been the most effective form of attack on a defended harbour. With this omission it may be said that the forms of attack are: (*a*) Bombardment; (*b*) Attempts to block narrow parts of the approach channel by sinking ships in the fairway and so sealing up the harbour; (*c*) Close attack by small torpedo craft on ships or dockgates, probably at night.

(*a*) *Bombardment.*—This form of attack may be taken to include not only bombardment of the object for which the harbour exists, such as a dockyard or anchorage, but also action, analogous to counter-battery in land warfare, against the batteries protecting the harbour, as in the event of bombardment these batteries naturally come into play. The positions of these batteries will largely depend upon the topography of the environs. There are two general types of harbours, namely, one with an approach channel, which may be either long or short and broad or narrow, or one where the coast-line is to all intents a straight line, the harbour being formed by a slight indentation of the coast, or by artificial breakwaters.

Whenever possible the batteries should be pushed out as far as may be from the real object of defence. This has always been advisable, but in these days it is more than ever necessary. The fact must be faced that with the present long ranges a larger amount of ammunition will be necessary than previously to obtain hits on hostile vessels. This means expenditure of time, during which the vessels may be able to shell the area forming their point of attack and inflict damage.

It may be taken now that bombardment can take place from such distances as 50,000 or even 60,000 yd., and across intervening portions of land. If at all possible then the primary batteries should be pushed so far forward that they can keep ships beyond this distance, or be so far forward that they will bring an effective fire to bear on the ships at much less than extreme ranges, before the latter come within bombarding range.

This, however, is not always possible, and in the event of a straight coast-line the enemy will be practically equidistant from the batteries and from the object of their defence. This will undoubtedly be a great disadvantage to the batteries, and the number of guns will have to be greater than usual in order to occupy fully the attention of the hostile vessels.

In the past, when the range of artillery was shorter, it was sometimes necessary to construct forts in the sea itself in order to cover effectually the whole of a broad channel, *e.g.* Spithead, Kronstadt or the entrance to Tokyo Bay. Nowadays, however, this will practically never be necessary.

The experiences of the World War have shown that the number of guns required to defend a harbour is even less than it used to be. Enemy ships for one thing will be chary of approaching too close on account of mines, submarines and electrically controlled torpedo craft, and the great superiority of modern land range-finders over ship range-finders will ensure greater accuracy on the part of the shore guns. These latter should be well dispersed and should be able at the same time to concentrate their fire. Batteries with single guns would have their advantages, but there would always be the chance of a lucky hit from the sea putting the gun out of action and so silencing the fire from a portion of the defence. It is probable then that there will be always two guns in a battery, but they will be well separated by about 200 yd. or even more.

Form of Batteries.—The form that batteries will take will undoubtedly be influenced by the lessons of the war. Taking into consideration the long ranges in use and the dislike of ships to come close in, there are many advantages to be gained by making primary batteries into indirect-fire batteries, siting them where they will be unseen from the sea and controlling their fire at all times by some system of position-finding. The advantages so gained would be, increased protection from hostile fire, much greater latitude in the choice of sites, a great simplification in design due to the protection the battery gains from its position and probably easier communications up to the battery. The disadvantages are, loss of range, a certain area of dead water in the foreground of the battery, and the impossibility of fighting the guns in the event of the means of control of fire breaking down. The loss of range would be unavoidable but the amount would be small. The area of dead water would depend upon the topography of the coastal region (it is always assumed that the dead water is navigable). In very many cases it can be covered by the fire from another primary battery. Should this not be the case it might be necessary to instal a direct-fire battery *ad hoc*, which possibly might be able also to fulfil one of the duties of secondary batteries, or to use mobile howitzers to cover the area. As regards the third disadvantage, adequate protection for the communications of the fire-control system, together possibly with its duplication, would seem to reduce the contingency of this breakdown to a negligible point.

All the primary batteries erected by the Germans on the Belgian coast were for indirect-fire. After the evacuation by the Allies of

the Gallipoli Peninsula the Germans commenced the construction of an indirect-fire battery inland from Cape Helles, which was not quite finished at the end of the war, while at the Black Sea entrance of the Bosporus on the European side there was a battery constructed by the Germans which was sited (designedly or not) in a peculiarly clever manner. It was near Rumeli Fenner and contained three 24-cm. guns. Owing to the configuration of the ground it was an indirect-fire battery if used against ships in the Black Sea to the west of the Bosporus, while in the event of vessels trying to force the entrance the guns could use direct fire at a comparatively short range.

Size of Guns.—There is a certain amount of disagreement as regards the size of guns required in coast batteries. In the case of a straight coast-line the guns must be powerful enough and possess sufficient range to engage and cause the retirement of the ships, or at all events to make them confine their efforts to replying to the batteries. This means that they must be equal in ranging power to the guns of the enemy.

When an approach channel exists, however, and the batteries can be pushed forward, it is not really necessary that the coast guns should be as long-ranging as those of the ships. They only require to have sufficient range to enable them to bring effective fire on the ships before they come within bombarding range of the object of attack. To obtain long range it is also not really essential to have guns of very large calibre, although the life of a large gun is certainly longer than that of a smaller one of equal range. Naturally, the shell fired by a coast gun must have a real effect on a ship. But at the range at which actions are now fought the angle of descent is so great that the deck is more often than not the place where a hit would take place, and the protection in this part of a ship is not very great. On the Belgian coast the Germans had five 15-in. guns (38-cm.), four 12-in., and a number of 11-in., but it seems questionable whether, provided sufficient range can be economically obtained, a gun of 11-in. or possibly 12-in. would not be quite powerful enough for a coast battery against any kind of vessel. As already stated, it is necessary to reduce to a minimum the amount of material and number of men employed in coast defences, and the smaller the gun the greater the economy in both.

It has often been advocated that guns on railway mountings should be used for coast defence, and at first sight they appear to be advantageous. They can be moved comparatively easily from place to place in accordance with strategic requirements. But the ordinary railway heavy-gun mounting is not suited for use against ships since it does not give sufficient traverse, as it can be fired only a few degrees on either side of the axis of the railway. Ships are moving targets and coast guns must have a very large arc of fire. For considerable variations in the line of fire a railway gun has to be on a curve of the line and move along the curve as required. This is too slow for use against a moving target. From the point of view of protection the faculty of being able to be moved is hardly required, especially if the gun is firing indirectly. There may be strategic advantages however in having movable coast guns, designing the mountings so that they can be moved on rails and can also be transferred in a fairly short time from their travelling wheels on to prepared pivots.

Range-finding.—For the modern coast-defence gun it is essential that the best possible means of range-finding be employed. Many instruments have been used for the purpose. Some are adapted to give only the range of a target from the site of the range-finder, others termed position-finders give the actual position of the target on a chart of suitable scale and therefore its relation to the gun position, which is also marked on the chart.

Both range-finders and position-finders are of different kinds. Some depend on a vertical base and so require correction for tide level. Others depend upon a horizontal base and therefore must be in pairs, one at each end of it. In this case one is known as the transmitting instrument and the other as the receiving, the latter being near the gun. In a different class again is the self-contained range-finder, in which telescopes at either end of a tube from 3 to 33 ft. long, furnished with prisms, conduct the visual rays to central object-glasses—telescopes and object-glasses being so controlled by mechanism that when the two images of the target are in a certain definite agreement the range is marked mechanically.

The long ranges now required practically put out of court all instruments except those depending on a horizontal base, which must be sufficiently long to obtain intersections at the target that are not too acute. There are two classes of this system, one in which the receiving instrument itself combines the observations of the two and the results are automatically recorded on dials at the gun, the other in which the observations of both instruments are combined graphically at a central plotting station and the range and training are telephoned to the battery. The former system has the advantage of using fewer operators than the latter, but it requires more elaborate instruments and a larger number of electric circuits. The latter system is hardly any slower than the former, and its communications consist of telephones only. It is possibly the one best suited to conditions of active service.

The chambers required for the angle-measuring instruments are quite small, and though they must be in direct view of the sea they can easily be made very inconspicuous. The receiving instrument should be somewhere near the battery: if an indirect-fire battery it should be nearly straight in front of it. For economy, principally, it is customary for one pair of instruments to suffice for all the guns of a battery, one gun being selected as the "master," and the other guns are laid by previously worked-out corrections (known as group differences) upon the training of the master gun.

In order that the instruments can have sufficient range of vision it is necessary that they should be at a considerable height above sea-level. This is not always easy of attainment on a low-lying coast. In order to see the horizon at 50,000 yd. an observer must be a little more than 450 ft. above sea-level. But for coast-defence purposes a lesser height would serve, as the target ship will have some height above horizon. For instance, the records of a minor engagement between a German 11-in. battery near Blankenberghe, Belgium, and one or two British ships, show that the greatest range used by the battery was 27,000 yards. The instrumental system was a long-base position-finding one. The base was 9,445 yd., the receiving instrument was 110 ft. above sea-level, on the top of an hotel, and the transmitter was on the top of a house on the dunes, the instrument being 90 ft. above sea-level. This latter height has a sea horizon of 22,090 yd., but the battery was 1,670 yd. back from the sea. Thus the transmitter was laid on a target more than a mile beyond its sea horizon.

The Germans made great use of the tall buildings on the Belgian coast for their observing instruments, but it may be necessary to erect towers to obtain the requisite height.

The question of visibility is a very important one in the matter of range-finding, especially in such a climate as that of Great Britain. There are many days on the British coasts when a view of anything like 50,000 yd. is impossible, owing to sea fogs. Such are often low-lying, and it might be possible to overcome them by the use of captive balloons. Another means of correcting fire is the employment of aircraft, which may be used by both sides in the contest. Here length of range is immaterial, but the accuracy of observation is naturally far less than that from instruments.

Self-contained instruments (such as the Barr and Stroud and the Zeiss) have been mentioned above. These are range-finders only. They were supplied in large number to the German batteries on the Belgian coast, but the records show that they were not relied on for long ranges, but regarded as stand-bys in the event of anything happening to the long-base system.

Design of Batteries.—The experiences of the World War show that the battery of the future can be greatly simplified. No longer need it be regarded as a fort, and the fact can be frankly accepted that the chances of damage by hostile naval fire are extremely few; the batteries may be designed accordingly. The guns require their stable platforms of concrete, but parapets are not necessary. Ammunition can be stored in light weather-proof structures or in covered railway wagons on a feeding railway, protection being sought by dispersion rather than by thickness of covering. The supply of ammunition to the guns must naturally be made as easy as possible, and great use can be made of light tramways.

This type of battery was used by the Germans in Belgium in the later stages of the war. At first their batteries were all of the type in use before the war, with heavy concrete and earth protection over the magazines. But after their experience of many bombardments they practically abandoned all material protection. Also, while the earlier range-finding stations had thick concrete protection the later structures were weather-proof only.

Effect of Aircraft.—The war has introduced a new arm which cannot be ignored in any branch of the military art, namely, the air service. As already mentioned, aircraft can and will be used for correcting the fire both of ships and of coast batteries. But it is also necessary to consider the offensive action of aircraft against batteries. Unless the aircraft can descend low enough to make use of machine-gun fire this action will consist of bomb-dropping. The use of bombs is very similar to the use of long-range large shell, and, at all events up to the present, it is extremely difficult with bombs to obtain any accuracy against small targets.

A coast-battery gun emplacement may be taken to be about 12 yd. in diameter. If an aeroplane were travelling at a speed of 120 m.p.h., in order to get a direct hit on such a target the bomb must be released at an exact fifth of a second, the plane must be flying exactly across the emplacement, and there must be no wind at all, or at all events no variation in the wind, during the descent of the bomb. All these conditions are very difficult to fulfil conjointly, but practically only direct hits will put the gun out of action. It would also be quite easy to erect vertical splinter-proof protection round an emplacement to guard against approximate hits, although this has the disadvantage of making it more conspicuous to the eye of an aerial observer. Efficient overhead cover for the guns is almost impossible to provide, and is not really required.

It would probably be advisable to furnish some material protection for the gun detachments when not in action, as the explosion of large bombs in close vicinity is a trying experience.

However, the main protection of batteries against aerial attack will lie in the use of counter aircraft and of anti-aircraft guns. Even with the latter only hostile craft will have to keep high up, and the accuracy of their aim will be very greatly impaired. Therefore every battery must be within the rayon of some anti-aircraft guns.

Direct-Fire Batteries.—Under certain circumstances it may be impossible to site a primary battery in a position concealed from the sea. It may have to be a direct-fire battery. In this case it should, if possible, be on a high site in order to facilitate fire with automatic sights at short range and also to render it less easy to hit. Since the guns will be visible from the sea every endeavour must be made to render them as bad targets as possible, by having nothing upstanding in the outline of the battery as seen from the sea. The essential point is that they must have a background. This may exist naturally, but, if not, an artificial background must be provided with an outline in keeping with the vicinity.

As regards ammunition storage it would still seem advisable to adopt the scheme of small dispersed expense stores with tramway communications to the guns, combined with small dumps in or near the gun emplacements for immediate use.

(*b*) *Blockship Attack.*—Hitherto only the primary batteries have been considered for protection against bombardment, but there are the other possible forms of attack, which necessitate the use of secondary batteries of lighter guns. One of these is attack by blockships in order to seal up a harbour. This is possible only where there is a very narrow channel which is to seaward of the important part of the harbour. For instance, there are the entrances to the harbours of Santiago de Cuba and Port Arthur, and to the Bruges ship canal at Zeebrugge. These were all attacked in modern times; the attempts made by the American and Japanese navies respectively were unsuccessful, while at Zeebrugge the British attack succeeded.

Such attempts would always be made at night, and old warships would often be used for the purpose. This means that the time available for stopping the ships would be very short, and the feat is not to be accomplished easily. But they should be stopped before they reach the bottle-neck of the channel.

The defence guns must have a rapid rate of fire with good shell-power, and the means of illuminating the approaches must be the best possible. It may well be also that, in certain cases, torpedoes fired from the shore would prove effective. The guns need not be of the heaviest calibre, but nothing under a 6-in. gun will be of much use. The idea of protection for these guns requires very little consideration. In the dark there is little chance of direct hits on them, while shrapnel can be guarded against by light gun-shields. Such guns, and all secondary armament, should be direct-fire, with automatic sights.

The successful blocking of the Bruges ship canal on April 23 1918 is an excellent instance of the fact that a fleet, which is determined to come to close quarters with coast defences, will most surely find out any weak spot in the latter. There were weak spots at Zeebrugge. Most of the German guns were sited as if they were meant to defend the water outside the Mole, and none seemed to have been specifically allotted to deal with blockships, although the Germans quite realized the possibility of such a form of attack. The searchlights were sited similarly—there was no concentration of illumination at the spot where the guns could have been certain of hitting. On the other hand the flanks of the canal entrance were crowded with machine-guns, trench mortars and rifles, some machine-guns being only 50 yd. from the final positions of the blockships. These weapons were of no use in stopping the ships, but were admirably placed for killing the crews, who, in leaving the ships, were completely exposed. That the losses amongst the crews of the blockships and the motor-boats were small can only be put down to the theory that "Fortune favours the brave."

(*c*). *Close Torpedo Attack.*—Another form of close attack is that by small craft such as destroyers, torpedo-boats or motor craft, which would attempt to run in at night and attack ships at anchor inside a harbour, or dockgates, using the torpedo as their main weapon. Here the question of the electric lights (*see* 6.601) is of primary importance. To stop such an attack secondary batteries are required. The guns of these batteries will have to possess increased shell-power compared with those previously in use, in order to keep pace with the greater protection and greater speed now given to torpedo craft. This increase of speed gives less time for the shore guns to get in their hits, and therefore it is essential that each shell should have good destructive effect. Wherever possible very low sites should not be used for secondary batteries. A certain height facilitates the use of automatic sights with the guns and favours observation of fire, and the guns are better enabled to see their target in the beams of the electric lights. However, it must be remembered that no dead water is permissible with these batteries, and that the limit of navigable water is nearer the shore for light craft than for larger ships. Therefore, there are limits to the height at which secondary batteries should be placed, taking into account the angle of depression obtainable with the guns.

With an illuminated area of water it is generally not possible to bring an effective fire on torpedo craft at a greater range than 1,000 yd., at which range a height of 40 ft. is sufficient to allow automatic sights to be used effectively. While foggy weather would probably interfere with an attack of this nature some craft might try to take advantage of the obscuration of the lights and creep in. In such a case sound-ranging, especially sub-aqueous, a new method of position-finding produced by the war, could be profitably employed to ascertain the position of any such craft and allow a fairly accurate fire to be developed against it.

It seems probable, however, that modern conditions will render this form of attack less likely in the future than it was thought to be in the past. Still another form of it may have to be taken into account should the use of torpedoes from aircraft attain the success which its advocates prophesy. Here the direction of approach of the enemy is not limited to a navigable channel, as the aircraft may descend from any quarter of the heavens. The defence against this modern phase is practically the general case of defence against any aircraft, except that the planes should be attacked as soon as possible before they have a chance to release their torpedoes. Also, they will be most likely to effect this release where their torpedoes have a fair run in the water against their targets.

(2) *Defence of a Channel.*—Here the word channel is meant to imply a comparatively narrow stretch of water which has open or nearly open water at either end, the passage of which it is desired to bar to an enemy. Such channels as the Straits of Messina, the Straits of Shimonoseki, the Dardanelles and the Bosporus would come within the meaning. Also it may be taken to include harbours having a long channel of approach and a wide stretch of water inside the channel.

A fair number of cases in which such channels have been fortified and attacked have occurred in history. Not to go too far back, in 1807, a British squadron under sail forced the Dardanelles in spite of the batteries. In this case and in similar cases in the past the outstanding feature has been that gun-fire alone has not been able to stop the passage of a determined fleet, where the ships have been able to pursue their course unhindered by obstacles and where they could finally gain water unswept by gun-fire. Perhaps the most striking instance of such an operation was the passage of the Federal squadron under Farragut at Vicksburg on the Mississippi in 1863. The ships were slow and the current was swift, the navigation was not easy, the range was short and the guns were well-sited. But the squadron passed the town not once but several times. The defenders relied on their batteries only, no obstacles being placed in the river.

The World War produced a notable instance of this class of operation in the attempts of the British and French fleets to force the passage of the Dardanelles. Here the current is swift but the ships had greater speed than those of 1863. The Turkish batteries were certainly numerous but the guns were not up to date, and the batteries were generally badly sited and designed. But the Turks did not depend upon their guns only; they made extensive use of obstacles in the shape of submarine mines.

A desultory bombardment took place on Nov. 3 1914, but the real attack did not begin till Feb. 19 1915. The entrance to the Straits was gained and operations continued inside, culminating in the great attack on the main batteries near the Narrows on March 18 1915. In his despatches the British admiral states that the withdrawal of the ships was due to the menace of the mines. It may be said that the backbone of the defence was the minefields. Until they were removed the ships were hampered in their movements and could not deal properly with the batteries protecting the minefields; also the ships could not remove the mines until the protecting batteries were silenced. The attack of March 18 was not repeated.

It is possible and even probable that if the Turkish batteries had been of a modern pattern and had possessed proper range-finding appliances (the Germans added these afterwards) the shore guns might have played a larger part than they did, and this point should be remembered should similar operations take

place in the future. If the ships are intent on forcing a channel ranges will naturally become short and the fire of the shore guns will become very accurate. The small battery at Hartlepool which fought the German squadron on Dec. 16 1914 undoubtedly left its mark on the enemy vessels.

The outstanding lesson of the naval operations in the Dardanelles would seem to be a very old one—that men are more than material, that even moderately armed and organized defences, when manned by stout-hearted troops, as the Turks undoubtedly were, although not well trained technically, can still have in them a very great power of resistance, provided the tactical organization of the defence is not radically unsound.

It has been mentioned with reference to the Dardanelles that minefields may play an important part in the defence of a channel. Such minefields, although they may, by the active power of the mines, do great damage to a ship which strikes one, may be removed by sweeping or countermining, and really form an "obstacle" in the military sense of the word which to be effective must be protected by fire. It will therefore be necessary to arrange that minefields are under the effective fire of batteries. The guns of such batteries would probably be about the same size as those for dealing with torpedo craft, as the vessels used in attempts to remove mines will not be large. If possible minefield batteries should be so sited that they are protected from the fire of the larger hostile ships. This was done at the Dardanelles by taking advantage of the projecting points of land on both the European and Asiatic shores. As mine-sweeping would generally take place at night electric lights must be provided specially for the use of the minefield batteries.

(3) *Defence of a Landing-Place.*—In certain cases it may be necessary to prepare defences against the chance of an enemy landing on a stretch of coast. It would rarely be possible to hold such a line in any strength, nor would such a course be desirable, as it would mean locking up troops for an indefinite period, while it is hardly likely that no warning of a possible landing would be received. Suitable defences can play an important part by enabling small bodies of men to hold up an attack until reënforcements arrive, but for deliberate preparations to defend all possible landing-places the expenditure of men and materials will always be prohibitive. Such measures can be taken only in the case of very important places.

The line of coast to be dealt with may or may not lie within the rayon of a coast fortress. If it does there may be some guns of the fortress capable of bearing on the water in front of the shore to be defended, and their fire will be of the greatest value against both the covering ships and the boats containing the landing force. The scheme of defence will have to be arranged so as to take full advantage of this fire and not to mask it in any way.

The works of fortification required on the stretch of coast-line will then fall under three heads: (*a*) defences on the actual coast so designed as to enable the minimum number of men to hold up any probable attack; (*b*) ample communications of all kinds to allow reënforcements to be sent up as quickly and as safely as possible to the threatened spot; (*c*) measures to be taken to deal with parties of the enemy who may succeed in effecting a landing and breaking through the defences on the shore.

(*a*) The nature of the coast-line to be defended will naturally vary in many ways, but, as it forms an assumed landing-place there will always be a beach or strand of some sort, and in all probability the gradient of the slope into the water will not be excessively gentle. It is likely also that in most cases the landing-place will be a bay, with reasonable expectations of higher ground at the extremities of the bay. A long straight coast-line is an unusual case.

The backbone of the scheme of defence on the coast-line itself should consist of the provision of enfilading fire along the shore and the water close to it where the landing parties are expected. To economize men use should be made of all the machine-guns which can be obtained. Advantage must be taken of all promontories in siting these enfilading weapons in order to obtain cover for them from the view, and if possible from the fire, of ships covering the landing, but in any case it should be ensured that all the possible landing beaches are covered by a sufficiency of fire, and this fire should be as grazing as possible. Therefore, the enfilading posts must not be high up above the water.

Should there not be any natural protection for these posts from view from the sea they must be made as inconspicuous as may be, their outline being blended into their background, and their colour corresponding with it. As they will be very low structures this should not prove difficult of accomplishment. It would probably be advisable that the machine-guns should be given splinter-proof cover, the weapons firing through slit loopholes. For deliberate work the actual posts for the machine-guns might well be made of concrete. Their distance apart will vary according to circumstances and ground, but a fair average distance might be taken as half a mile, allowing four enfilading machine-guns to each post.

An effective obstacle along the shore is of the greatest importance. This will usually be barbed wire, and it should extend all along the line to be defended as thick as circumstances will permit. The machine-guns must be able to enfilade the obstacle. If it is possible to erect any wire actually in the water this will greatly assist in impeding a landing and in breaking up the formations of the enemy. But the wire along the shore is the more important, that in the water being considered an addition.

The machine-gun posts should be protected by and should form part of small infantry posts, say for a platoon. These are primarily intended to protect the enfilading guns, and must therefore be prepared for all-round defence. At the same time they should be able to fire over the water and along the shore between them. These works must be quite inconspicuous, but this should not prove difficult to arrange. Each post should be completely surrounded with a wire obstacle, and as they may be shelled by the covering ships it would be well if some deep dug-outs were provided for the garrison. If not, the trenches themselves will give very fair protection.

Trenches actually facing the sea, in the case of a long coast-line, require a large number of men and should be used only sparingly. But it might be well to prepare some of these for occupation by some of the reënforcing troops, although the action of the latter is more likely to take the form of counter-attacking any hostile troops that have succeeded in landing. If such trenches can be enfiladed from the infantry posts so much the better, as then they would be of less value to the enemy should he manage to land and seize them before the defence reënforcements arrived.

In addition to any coast batteries that may be available field artillery and trench mortars should be ready to play their part in repelling the attack. These weapons should also, as a rule, be used for enfilading, and emplacements should be prepared for them together with shelters for their ammunition and detachments. Full advantage must be taken of any natural cover to secure protection for them from the fire of the ships.

(*b*) The provision of ample means of communication for reënforcements must be complete. They will depend on the local conditions, but it must be borne in mind that the covering ships will probably shell these communications and this must be prepared for. Points such as bridges on the line of route, road crossings, etc., must receive special attention in the way of providing alternative routes, and roads exposed to view from the sea should be screened, especially near the shore. Movement along such roads will always be liable to be noticed by hostile aerial observers, but these can be countered only by offensive action of the defending aircraft.

(*c*) Some works are also necessary to localize any successful attempts at landing. These should take the form of lines running back from the shore (" switches "), starting from one of the infantry posts on the coast. These switches would generally be inclined at an angle to the coast-line. If any coast batteries are included in the area the switches should be utilized to add to their defences, as the capture of such batteries would certainly form one of the objectives of the enemy. The actual work to be executed on these switches would consist mainly in providing a line of wire entanglements, but posts should be prepared at intervals which could cover this wire with their fire. (J. C. M.*)

COATS, the name of a Scottish family, which established at Paisley the Ferguslie cotton-thread mills, as well as mills in the United States, Canada, Mexico, South America, Russia and other European countries (now J. & P. Coats, Ltd.) and, with the fortune thence acquired, became munificent benefactors of their town (*see* 20.520). James Coats (1803–1845) and Sir Peter Coats (1808–1890), first and third sons of James Coats of Paisley, were the founders of the firm. The younger but eldest surviving brother was knighted in 1869, and his eldest son, Sir James Coats, 1st bart. (1834–1913), directed the fortunes of J. & P. Coats, especially in Canada and the States, his younger brother, Archibald Coats (1840–1912), being chairman of the company at Paisley. Sir James Coats was created a baronet in 1905 and died at Ayr Jan. 20 1913. His son, Sir Stuart Auchincloss Coats, 2nd bart. (1868–), was for a time a member of the old firm and of the associated American and Canadian Thread companies. Peter Coats (1842–1913), third son of Sir Peter Coats, and brother of Sir James Coats, another director of the firm, died at Whitney Court, Hereford, Sept. 16 1913. Sir Thomas Glen Coats, 1st bart. (1846–), second son of Thomas Coats

of Fergualie, younger brother of the founders of the firm, assumed by royal licence the surname Glen-Coats when created a baronet in 1894. He succeeded Archibald Coats as chairman of the firm and sat in the House of Commons for W. Renfrewshire from 1906 to 1910. His elder brother, JAMES COATS (1841–1912), was the giver of the Coats libraries, 4,000 of which were sent to villages and schools in Scotland. Each consisted of a bookcase containing about 400 volumes, and the school-children were provided with satchels for carrying the books to and fro. Spectacles to the number of about 90,000 were also supplied under the direction of a qualified oculist, to readers who needed them. Similar libraries were sent to places abroad, such as Smyrna, Cairo, Jerusalem, etc. No endowment was, however, provided, and the libraries, at first much appreciated, fell into disuse. A younger brother, GEORGE COATS (1849–1918), also a director of the firm, was raised to the peerage in 1916 as Baron Glentanar. He died at Glentanar, Aboyne, Aberdeenshire, Nov. 26 1918, and was succeeded by his son, THOMAS COATS (b. 1894).

COCHÉRY, GEORGES CHARLES PAUL (1855–1914), French politician (*see* 6.619), died in Paris Aug. 8 1914.

CODY, WILLIAM FREDERICK (1846–1917), American scout and showman (*see* 6.637), died in Denver, Col., Jan. 10 1917. He was buried in a tomb blasted from solid rock on Lookout Mountain, 20 m. from that city.

COHN, GUSTAV (1840–1919), German national economist (*see* 6.652), died in Sept. 1919, at Göttingen.

COLAJANNI, NAPOLEONE (1847–1921), Italian author and politician, was born at Castrogiovanni (Sicily) in 1847. He followed Garibaldi in his Sicilian expedition, and later at Aspromonte, when he was taken prisoner by the Royal troops and deported to Palmaria. Again in 1866 he fought under Garibaldi in the Trentino and was decorated with a silver medal for valour. Three years later, while a medical student, he was imprisoned for taking part in republican agitation. After graduating in medicine he took up the study of social science, and in 1892 was appointed professor of statistics at the university of Palermo. He published many books and essays on social and political problems, and exposed the fallacious and unscientific theories of Lombroso and Ferri on criminology. For many years he edited the *Rivista popolare*, by means of which he strove to improve the moral and intellectual standard of the masses and combated all forms of intolerance and hypocrisy. He began his public career as a municipal councillor in his native town in 1872; in 1882 he was elected provincial councillor and in 1890 deputy for the same place. In Parliament he sat as a Republican and showed Socialist tendencies. He was active in the exposure of the Banca Romana scandal, and a strong opponent of Crispi's somewhat autocratic tendencies. While he had always opposed militarism and had also attacked the army with much animus, on the outbreak of the World War he admitted his error in that connexion and became a warm supporter of Italian intervention. After the Armistice he conducted a vigorous campaign against the Socialist organ *Avanti* and the bolshevist tendencies of the Italian Socialist party. He died at Castrogiovanni Sept. 2 1921.

COLBY, BAINBRIDGE (1869–), American politician, was born at St. Louis Dec. 22 1869. After graduating from Williams College in 1890, he studied at the Columbia Law School and the New York Law School. He began to practise in 1892 in New York. He was counsel for Mark Twain in settling the affairs of the publishing house of Chas. L. Webster & Co. He was a member of the New York Assembly, 1901–2. He was an ardent supporter of the candidacy of Theodore Roosevelt for the Republican presidential nomination in 1912, and was in charge of the contests for seating the Roosevelt delegates in the national convention. Following the split in the Republican party he became one of the founders of the National Progressive party and was a delegate at its national convention in Chicago in 1912. He was an unsuccessful candidate for the U.S. Senate from New York on this party's ticket in 1914 and 1916. He was appointed a commissioner of the U.S. Shipping Board, and a member of the U.S. Shipping Board Emergency Fleet Corp. 1917–9. He was likewise a member of the American mission to the Inter-Allied Conference at Paris in 1917. In Feb. 1920 he was appointed Secretary of State to succeed Robert L. Lansing by President Wilson, to whose administration he had given his support.

COLERIDGE-TAYLOR, SAMUEL (1875–1912), British musical composer, was of Anglo-African parentage, his father being a native of Sierra Leone and his mother an Englishwoman. He was educated at the Royal College of Music in London, entering as a violinist in 1891. In 1893 he won an open scholarship for composition, and studied for four years under Sir Charles Stanford. In 1898 his cantata, *Hiawatha's Wedding Feast*, was produced in London with marked success, and was followed by two other cantatas, *The Death of Minnehaha* and *The Departure of Hiawatha* (*see* 19.85). This trilogy was first given complete at the Albert Hall, London, in 1900. *The Blind Girl of Castel Cuillé* was given at Leeds in 1901, *Meg Blane* at Sheffield in 1902, and an oratorio, *The Atonement*, at Hereford in 1903. He also produced *Endymion's Dream* and the *Bon-Bon* suite (1908–9), and *A Tale of Old Japan* (1911). He died at Croydon Sept. 1 1912.

COLLCUTT, THOMAS EDWARD (1840–), English architect, was born March 16 1840. After a pupilage with R. W. Armstrong, he entered the office of G. E. Street, where he remained as chief assistant for three years. The time spent under so strong and impressing an influence had, however, little effect on his own work and design in the future, which never went along Gothic lines, but always spoke his own predilection for a free and personal treatment of Renaissance work—owing more, perhaps, to French than to Italian suggestion. To this method he was, throughout his career, strongly attached, and his designs, shaped on these lines yet speaking his own individuality, had a pronounced influence on the current work of the English architects of the last quarter of the 19th century. It was at the beginning of this period that Collcutt made himself felt in helping forward the movement to which at the same time William Morris was devoting himself—for a highly raised standard in the consideration of the interior treatment and furniture of the English house. Under, and for, the then well-known firm of Collinson & Lock he carried out the decorative work to, and furniture for, many houses in various parts of the country, a preparation of value to him at a somewhat later period when he was one of the first artists to be asked to help in a worthier treatment of the interior decoration of the ships of the large steamship companies. In this capacity he dealt with a considerable number of the P. and O. steamships. It was in 1872 that T. E. Collcutt carried out his first important building—the free library at Blackburn, the commission for which he obtained, as was the case with much of his subsequent work, by a spirited and brilliant design which was successful in a large competition. The even more important town hall in Wakefield, obtained in the same manner, followed a few years later, and is an example of Collcutt's skill in arrangement of plan. His most noteworthy building, however, is the Imperial Institute, London, founded in 1886 by King Edward VII., then Prince of Wales, as a national memorial of the jubilee of his mother's reign. The new building faces on a road formed across the site of the Horticultural Gardens, the whole of the area of which it occupies, and its free and open position, thus obtained, gives it an advantage uncommon amongst modern London buildings. Its elevational treatment speaks the grace and refinement characteristic of the architect's work, and of his usual suggestion of verticality by means of non-ordered pilasters the whole height of the building. Its style is of a free Renaissance type, with details such as cornices and strings perhaps, as some critics say, on somewhat too small and delicate a scale. It nevertheless stands out as a successful achievement in modern English architecture, and one upon which the artist's signature is clearly written. With very much the same character and feeling Collcutt designed the Royal opera house, London—later known as the Palace theatre—making much use of marble and alabaster as decorative material for the interior, and later on he carried out the Savoy hotel, another instance of his careful plan arrangement. He was elected a president of the Royal Institute of

British Architects in 1906; he received that society's gold medal in 1902, and three years earlier was awarded the Grand Prix for architecture in connexion with his artistic services at the Paris Exhibition.

COLLIER, PRICE (1860–1913), American writer, was born at Davenport, Iowa, May 25 1860. He lived, while a boy, in Switzerland and England. After studying at Leipzig and at the Harvard Divinity School (B.D. 1882) he became a Unitarian clergyman, but retired from the ministry in 1891. He is best known for his clever sketches of national character in *America and the Americans from the French Point of View* (1896); *England and the English from an American Point of View* (1900); *The West in the East from an American Point of View* (1911) and *Germany and the Germans from an American Point of View* (1913). He died on the island of Fünen, in the Baltic Sea, Nov. 3 1913.

COLLINGS, JESSE (1831–1920), British politician, was born at Littleham, Exmouth, Devon., Jan. 9 1831. He was partly educated at home, and also at Church House school, Stoke, near Plymouth. In 1866 he settled in Birmingham, where he founded the mercantile firm of Collings & Wallis, and had a highly successful business career. Entering municipal life, he was intimately associated with Joseph Chamberlain, whose devoted henchman he became. In 1878 he was elected mayor of Birmingham, and in 1879 retired from business. In 1880 he was elected as Liberal M.P. for Ipswich, and during this period became prominent as an advocate of the Radical land policy, known as "three acres and a cow." In Dec. 1885 Lord Salisbury's Government was defeated on an amendment to the Address concerning this policy, moved by Mr. Collings. In 1886 he entered the Liberal Government as parliamentary secretary to the Local Government Board, but resigned with Chamberlain over Gladstone's Home Rule policy. The same year he successfully contested the Bordesley division of Birmingham as a Liberal-Unionist. In 1895, on the appointment of Chamberlain to the position of Colonial Secretary in the Unionist Government, Collings became under-secretary to the Home Office, retaining the post until 1902. He resigned his seat in Parliament in 1918. He was always interested in agricultural affairs, and was the founder (1872) of the Rural Labourers' League and also of the Exminster industrial school. In 1906 he published *Land Reform*, in 1914 *The Colonization of Rural Britain*, and his *Autobiography*, written in conjunction with Sir J. L. Green, appeared in 1920. He died at Edgbaston, Birmingham, Nov. 20 1920.

COLLINS OF KENSINGTON, RICHARD HENN COLLINS, BARON (1842–1911), English jurist and lord of appeal, was born in Dublin Jan. 1 1842, and educated at Trinity College, Dublin, and Downing College, Cambridge. He was called to the English bar in 1867 and joined the northern circuit. He edited the 7th, 8th and 9th editions of Smith's *Leading Cases*, was made a Q.C. in 1883 and a judge in 1891. In 1897 he became a judge of appeal and a privy councillor, in 1901 Master of the Rolls, and in 1907 a lord of appeal (resigning in 1910). In 1899 he represented Great Britain on the tribunal appointed to arbitrate in the boundary dispute between British Guiana and Venezuela; and in 1904 he was chairman of the commission which investigated the case of Adolf Beck (*see* 14.287) and resulted in his conviction being annulled. Lord Collins died at Hove Jan. 3 1911.

COLLYER, ROBERT (1823–1912), American divine (*see* 6.694), died in New York City Nov. 30 1912.

COLOMBIA (*see* 6.700).—According to the census of 1912, the South American republic of Colombia (excluding Panama) had a pop. of 5,072,604, living in 14 departments, two territories (*intendancias*) and seven special districts (*comisarias*).

Significant modifications of the constitution of 1886 were made by the Congress of Colombia in 1910. A law enacted on June 6 provided that, in case of a vacancy in the presidency, two persons selected by Congress were temporarily to exercise the powers of the president in a designated order. If Congress did not select any substitute, then the members of the president's Cabinet were to assume the powers of the president in an order to be designated by law. The presidential office was declared to be vacant in case of the president's death, the acceptance of his resignation, or his demotion by judicial sentence. The Senate was given the right to determine when the president was permanently incapacitated to perform his duties or when he had abandoned his post. On Oct. 31 1910, another law was enacted that made important constitutional amendments, among which was a provision that only male citizens who were able to read and write, and either owned real estate, or had an income, should be allowed to vote in congressional and presidential elections. Capital punishment was prohibited. The president's term of office was limited to four years. Senators were to be chosen by assemblies in the respective departments. The Supreme Court was granted the right to determine whether or not a law should be enforced which the national Government or a citizen had denounced as unconstitutional. During the administration of President Concha (1914–8), Congress enacted a law providing for the re-establishment of the Council of State which was to be composed of eight members, namely, the first *designado* and seven members to be appointed according to law. This council was to act as an advisory body to the president.

Communications.—European steamship service to Caribbean ports of Colombia was much disturbed by the World War, but later was largely reëstablished. Early in 1914 wireless stations were in operation at Cartagena, Santa Marta, and San Andrés. Communications with the United States were much improved by the service of the United Fruit Co. with vessels touching at Cartagena, Puerto Colombia, and Santa Marta. Measures were taken by Colombia to promote good roads. In 1920 the total railway mileage was not quite 800 miles. Various short railway lines were at that time either projected or under construction. From Puerto Wilches a railway eastward was begun, designed ultimately to reach Bucaramanga. Plans were laid for the extension of the Pacific railway on the north to Cartago and on the south to Carchi. The Northern railway was built from Bogotá to Nemocón and plans were made to extend it to the lower Magdalena river via Chiquinquirá. Puerto Berrio and Medellín were connected by rail. An extension of the Araucaplumas and La Dorada railway to Giradot was being considered, and one through the department of Caldas toward Pereira was being built. The great artery of interior traffic remained the Magdalena river.

Foreign Commerce.—In 1910 the foreign commerce of Colombia totalled 35,008,191 pesos de oro (nominal value \$0.973 or approximately one-fifth part of £1 sterling); in 1913 it totalled 62,851,032 and in 1915 49,419,481. According to official statistics the total value of Colombia's imports for 1916 amounted to 29,660,206.16 pesos de oro; while her exports came to 36,006,821.16 pesos de oro. Her most important imports were roughly classified in pesos de oro as follows:—Textiles, 13,476,932.37; provisions, salt, etc., 2,436,578.78; metals, 2,240,845.86; drugs and medicines, 1,346,516.33; paper, etc., 913,502.97; agricultural and mining implements, 830,622; lighting and fuel, 681,816.98; liquors, 666,351.33; oils and greases, 242,450.

During the war there was a great increase of commerce with the United States. In 1916 more than 50% of Colombia's imports were from that country; 28% were from England; about 3% from France; and 3% from Spain. Her exports were classified as follows:—Vegetable products, 22,801,094.51; mineral products, 7,289,070.34; animal products, 4,127,179.72; manufactured articles, 1,173,158.81; live stock, 521,905.58; money, 68,443.80; miscellaneous, 25,968.40. In 1916 over 85·13% of Colombia's exports went to the United States; 7·35% to Venezuela; 1·8% to England; 1·53% to Panama; 1·03% to France and 0·96% to the Dutch Antilles.

Army and Navy.—A law of 1916 fixed the size of the standing army at 6,000 men, artillery, engineers and infantry. In time of war men not in active service might be summoned to the colours. It was estimated that the army could thus be swelled to 120,000 men. In 1920 a decree was issued which fixed the period of obligatory service for infantry at 15 months; for cavalry and artillery at 18 months; and for railway engineers at 24 months. The navy in 1921 was composed of a few small cruisers, gunboats, and other vessels. Steps had been taken to establish a military aviation school.

Education.—Primary education was free but not compulsory for children between the ages of 7 and 14. It was in charge of and supported by the departments except in Bogotá where it was maintained by the national Government. The census of 1912 indicated that some 50% of the population of the republic was illiterate. In 1916, according to figures of the Minister of Public Instruction, there were in Colombia 5,387 primary schools. The total attendance at primary schools, both public and private, was 347,985. Secondary education was in charge of the Minister of Public Instruction who was assisted by an inspector in each department. In 1916 there were in Colombia 401 institutions, public and private, where secondary and professional training was given to both sexes. The total of primary, secondary and professional educational institutions, public and clerical, for both sexes in Colombia in 1916 reached 5,839, and the total attendance 384,089. The chief

institution of higher education was the National University at the capital, which in 1920 was composed of four colleges, one of philosophy and letters (*Colegio del Rosario*), one of medicine and natural science, one of mathematics and civil engineering, and one of law and political science.

Finances.—In 1911 and 1913 Colombia contracted new foreign loans aggregating some £1,800,000 and bearing interest at 6%. The budget for 1920 estimated the total revenue at 23,845,250 pesos de oro; and the expenditures at 27 792 581.37 pesos de oro. In his message to Congress, July 20 1920, President Fidel Suárez estimated that the revenues for the current year might reach 24,000,000 pesos de oro. At that date the external debt of Colombia amounted to 8,508,000 pesos de oro, besides a debt of 11,355,065 pesos de oro which had been incurred to promote the construction of railways. Upon these debts the Government was paying interest regularly through a London firm. The internal debt of Colombia was composed of the consolidated debt and the floating debt, amounting respectively to 2,848,260 pesos de oro and 10,840,654 pesos de oro. The total debt in July 1920 amounted to 35,040,073 pesos de oro, excluding some 4,000,000 pesos de oro of current obligations.

Monetary System.—By a law of 1909 the regulation of Colombia's currency was entrusted to a board which was directed to gather a gold reserve and to guarantee the redemption of the paper money and to give new bills and coins in exchange for old paper. The ratio of the gold peso to the pound sterling was fixed at 5 to 1. In 1915 an official estimate of the money in Colombia in U.S. currency was as follows:—

Paper money	$10,056,300
Silver coin	4,004,700
Nickel coin	997,700
Colombian gold coin	85,000
English and U.S. gold coin	6,356,300
Old silver coin, Colombian and foreign	3,000,000
Gold coin on deposit	2,586,400
Total	$27,086,400

Early in 1916 the Government issued an order that paper currency should be exchanged at the rate of 100 paper pesos (moneda papel) for one peso de oro in coin or new banknotes. The monetary unit of Colombia was in 1920 the gold peso.

History.—On Aug. 3 1909, Gen. Rámon González-Valencia was elected by Congress to serve as president for one year in place of Gen. Reyes, who had resigned. On July 15 1910, Carlos E. Restrepo, a journalist and publicist, was elected president. President Restrepo aimed to restore the credit of the country, to rehabilitate the finances, and to make a satisfactory adjustment of the Panama affair. At the end of his term he refused to become a candidate for reëlection. In the presidential election of Feb. 1914, a Conservative, José Vicente Concha, was elected president for four years. The Liberal candidate had withdrawn from the contest before the election was held; and President Concha, who was inaugurated on Aug. 7 1914, gave the Liberals minority representation in his Cabinet. His Minister of Foreign Affairs was the *littérateur* and statesman, Marco Fidel Suárez; and his Minister of the Treasury was the liberal leader, Diego Mendoza. Before the end of Concha's administration, however, the last-named minister resigned from the Cabinet. Aside from fiscal and diplomatic problems which he inherited, President Concha had to face new problems resulting from the war. In Oct. 1917 the Minister of Foreign Relations, whom the Conservatives had nominated for the presidency, resigned from Concha's Cabinet. Marco Fidel Suárez was elected president of Colombia in Feb. 1918. He was inaugurated on Aug. 7 for the term 1918–22.

Colombia's relations with Panama and the United States had long remained delicate because of unsettled questions arising out of the setting up of Panama as a separate State in 1903. After Gen. Reyes' visit to Washington failed, an attempt was made in 1909 to adjust those questions by a treaty negotiated by Colombia's envoy, Enrique Cortés, and Secretary of State Elihu Root. In connexion with the projected treaties between Colombia and Panama and between Panama and the United States, this treaty stipulated that Colombia should acknowledge Panama's independence; that Colombia should renounce all claims and declare Panama free from all debts incurred by Colombia before Nov. 3 1903; and that Panama should pay Colombia annually $250,000 (U.S. currency) for 10 years. As this agreement was unacceptable to Colombia, on April 6 1914 Thaddeus A. Thompson, minister of the United States in Bogotá, and José F. Urrutia, Minister of Foreign Relations for Colombia, signed a treaty containing expressions of regret by the United States for the difference that had arisen between herself and Colombia because of Panama, granting Colombia special privileges in the use of the Panama Canal, and providing that the United States should pay Colombia $25,000,000 to recompense her for the damages due to Panama's independence. This treaty was ratified by a law of the Colombian Congress on June 9 1914. The apologetic phrases, in particular, occasioned delay in the United States: with modifications, in April 1921 it was ratified by the U.S. Senate.

After the outbreak of the war, Minister Fidel Suárez addressed a circular to the editors of Colombia, on Nov. 27 1914, exhorting them to observe a strict neutrality. In response to a communication of Germany's minister at Bogotá, announcing the renewal of the unrestricted submarine campaign, Fidel Suárez expressed a desire for an end of the war and deplored its effects. When he mentioned the use by belligerents of measures which rendered it difficult to save neutral property and innocent lives he declared that his Government reserved the right to protest and to demand justice. On June 2 1917 he sent a circular to the governors of departments stating the intention of his Government to observe neutrality in the war between the United States and Germany. In making this announcement he took occasion to deprecate certain attempts that had been made to show that Colombia "sympathized incorrectly with one or another of the belligerents." As one of the countries invited to accede to the League of Nations, the Government, in accordance with the authorization of Congress dated Nov. 3 1919, accepted and joined the League. In filing her adhesion, however, Colombia served notice that her acceptance of Article X. of the Covenant did not imply her acknowledgment of Panama as an independent nation. Two delegates from Colombia attended the assembly of the League at Geneva which adjourned in Dec. 1920.

COLORADO (*see* 6.717).—The pop. of the state in 1920 was 939,629; in 1910, 799,024—an increase of 140,605, or 17·6% as compared with 48% in the preceding decade. Native-born were 83·8% in 1919, whites 98%, negroes and Indians numbered 12,935, and there were 3,736 Chinese and 2,300 Japanese. The density of pop. increased from 7·7 persons to the sq.m. in 1910 to 9·1 in 1920. The decay of mining towns altered the balance between urban and rural pop.; in 1920 the urban pop. was 48·2%, the rural 51·8%; in 1910 the urban 50·7% and the rural 49·3%. The pop. in 1920 of the six cities then having a pop. of over 10,000, their pop. for 1910 and the percentage of increase, were:—

	1920	1910	Increase Per cent
Denver	256,491	213,381	20·2
Pueblo	43,050	41,747	3·1
Colorado Springs	30,105	29,078	3·5
Boulder	11,006	9,539	15·4
Greeley	10,958	8,179	34·0
Trinidad	10,906	10,204	6·9

Leadville decreased in pop. from 12,455 in 1900 to 7,508 in 1910 and to 4,959 in 1920.

Agriculture.—During the decade 1910–20 agriculture displaced mining as Colorado's most important industry. The number of farms increased 29·8%, to 59,934; their area 80·8%, to 24,462,014 ac.; and their average size 39·2%, to 408·1 acres. The value of all farm property increased 119·1%, to $1,076,794,749. Land values

were estimated at $763,722,716; buildings at $102,290,944; implements and machinery at $49,804,509; and live stock at $160,976,580. The farm crops in 1919 were:—

Crop	Acreage	Production	Value
All crops			$181,065,239
Cereals, total . . .	2,640,664	38,436,550 bus.	63,380,214
Corn	752,637	10,105,627 "	14,147,875
Oats	174,189	4,535,527 "	4,308,752
Wheat	1,328,616	18,260,663 "	37,616,960
Hay and forage . .	2,215,730	3,580,123 tons	60,769,080
Vegetables . .			24,804,225
Misc. crops, total . .	176,494		17,673,726
Fruits and nuts . .			8,751,678
Orchard fruits . .		4,627,825 bus.	8,226,734

The irrigated area was 2,792,032 ac. in 1909, 3,348,385 ac. in 1919, while acreage under all irrigation enterprises, whether completed or not, had decreased from 5,917,457 to 5,220,588 acres. Organized drainage enterprises, most of them having been rendered necessary by faulty irrigation, had affected 171,656 ac. at a cost of $1,081,875. In 1920 there were in the state 420,704 horses, 31,125 mules, 3,099 asses and burros, 1,434,423 beef cattle, 322,193 dairy cattle, 1,813,255 sheep, 28,688 goats, and 449,866 swine. In the same year the number of poultry was 2,994,347, and there were 63,253 hives of bees.

Mining.—Colorado's rank among the states in the production of the principal metals in 1918 was as follows:—Radium, first, with an output of $7,500,000; tungsten, first, with an output of $1,833,600; gold, second, with an output of $12,944,600; lead, second, with an output of 64,282,841 lb.; zinc, fifth, with an output of 88,141,748 lb.; silver, fifth, with an output of 7,071,768 oz.; copper, tenth, with an output of 6,423,919 pounds. Production of coal reached a total of 12,511,481 short tons in 1917. Petroleum production in 1917 fell off to 204,000 barrels. There has been great interest in the deposits of oil shale in the Green river formation in the western parts of the state. Processes for exploitation on a commercial scale have not yet been put in operation.

Manufactures.—From 1900 to 1920 the number of manufacturing establishments in Colorado nearly doubled, the number of persons engaged more than doubled, and the capital invested increased 225%. In 1919 there were 2,631 manufacturing establishments, employing 44,731 persons, using capital to the amount of $243,827,000, and the value of the products was $275,622,000. Higher prices rather than increased production caused most of the increase. In 1914 the state ranked thirty-second in value of manufactured products, which represented only 0·6% of the value for the United States. Beet-sugar manufacture became the leading factory industry in 1914. There were 14 operating plants in 1919, which manufactured sugar valued at more than $37,000,000. Slaughtering and meatpacking products amounted to more than $41,000,000. Flour and gristmill products ranked third in 1914, with a value of $7,535,633; a moderate increase in output in 1919 was accompanied by high prices, giving that year an unusual value of $20,000,000. Butter, cheese, and condensed-milk industries became important, their products being estimated at $12,000,000 in 1919.

Education.—In 1919 the illiterates, 10 years of age or over, were 3·7% of the pop. of the state, although the foreign-born whites of those ages were 11·3%. There were 1,880 school districts in the state in 1919, maintaining 3,125 schools and employing about 7,500 teachers. The school pop. for the year ending June 30 1918 was 257,884, and the enrolment in public schools 191,199. Public school expenditures for the year were $9,892,699. The total amount invested in school property was $15,212,000, an average of $79.08 per pupil enrolled. The state's permanent school fund, derived from Federal land grants, amounted to $4,948,492 in 1918. The income of the permanent school fund (about $600,000) is apportioned among the school districts, giving about $2.35 *per capita* of the school population. Sales and leases of school lands, and royalties on minerals, have increased the state school funds, and the unsold lands, together with coal and other mineral reserves, are estimated at $125,000,000. County and district tax levies, the main source of school revenues, produced $11,572,155 in 1918. There was a pronounced movement for the consolidation of rural schools, and for joint support of centralized schools in which two or more counties are interested. The Legislature of 1921 passed a law providing a minimum salary for teachers graded for the several classes of districts. Several districts in cities (notably in Denver, Colorado Springs, and Sterling) in 1920 adopted salary schedules which fixed higher standards for teachers with advanced professional training. Public high schools and institutions of higher education developed from 1910 to 1920 even more rapidly than elementary schools. Enrolment of students taxed the capacity of secondary schools and colleges, requiring increased taxation for current expenditures and bond issues for buildings. The enrolment in the secondary schools in 1920 was 24,404; in 1910, 11,495.

Finances.—The total bonded indebtedness of the state Nov. 20 1920 was $4,187,300. The general assessment valuation of taxable property in 1919 was $1,498,661,128, in 1920 $1,591,307,396, on which there was a state levy of 3·47 mills, producing $5,200,355 in 1919 and $5,521,836 in 1920.

History.—A special session of the Legislature in 1910 submitted to the voters a constitutional amendment adopting initiative and referendum, which was ratified in Nov. of that year. The same special session adopted a primary election law, providing for direct nominations by the people of candidates for the U.S. Senate, Representatives in Congress, and all elective state, district, county, ward and precinct officers, as well as members of the state Legislature. This Act provided for party assemblies, at which party candidates might be designated to seek nominations in the primaries, every candidate receiving 10% or more of the votes of the delegates to the assembly being certified by the assembly as a candidate to enter the primaries. It was also provided that persons not entering the assembly might become candidates for any of the offices above mentioned by petition, the number of signers required being 300 for any official who is to serve any political district in the state greater than a county and 100 for other officials. The expense of candidates in such primaries was limited by the Act and severe penalties were provided for violations. In 1911 an Act was passed providing for registration of voters for all elections to be held in the state except school elections, and providing severe penalties for false registration and other violations of the Act. In Nov. 1912 the people approved amendments to the state constitution providing for recall of elective officials and, in certain cases, for the recall of judicial decisions. An Act proposed by initiative was passed at the same time, providing for a ballot without party headings.

The voters adopted in Nov. 1914 an amendment to the state constitution prohibiting the sale and manufacture of intoxicating liquor, which became effective Jan. 1 1916. The Legislature at its regular session in 1917 petitioned Congress to adopt an amendment to the Federal Constitution to prohibit the manufacture and sale of intoxicating liquors in the United States, and the prohibition amendment to the Federal Constitution was ratified by the Colorado Legislature in regular session Jan. 15 1919.

The Legislature in 1919 passed an Act providing for a budget system in making appropriations and creating a state budget and efficiency commissioner. The first budget prepared under this Act was presented to the Legislature in 1921. The Legislature in 1921 passed amendments to the constitution, for submission to the voters, proposing the extension of the tenure of state and county officers from two to four years. A proposal was submitted to the voters for a convention to revise the state constitution, this action being simultaneous with the failure of a series of Acts urged by the governor for the reform and consolidation of executive offices and boards. Persistent advocacy by the governor secured the passage of laws for reëstablishment and encouragement of a national guard, for a department of safety with a force of rangers as a state police force, and for a substantial appropriation to be available to suppress riots.

There were a number of serious labour disturbances between 1910 and 1920, some of them marked by violence and virtual insurrection which had to be put down by the military forces. A notable contribution to better relations between capital and labour was the industrial representation plan put into effect by John D. Rockefeller, Jr., in the properties of the Colorado Fuel and Iron Co. in 1916. Employees, by districts and classified groups, elect representatives who have the right to confer with executives on all questions affecting wages, conditions of employment and operation, and general welfare. The success of the system in Colorado has had marked influence on similar large industrial organizations elsewhere.

In 1910 the state administration was in the hands of the Democratic party, with Joseph H. Shafroth as governor. The Democrats again elected a governor in 1912, Elias M. Ammons, a result largely due to the split in the Republican party throughout the nation. In 1914 George A. Carlson, Republican, was chosen governor. He was succeeded by Julius C. Gunter, Democrat, elected in 1916 when the leadership of President Wilson on international issues made his party dominant in the states, largely through women's votes. A reunited Republican party, profiting by popular reaction on war issues, elected Oliver H. Shoup as

governor in 1918, and reëlected him in 1920 with an increased majority and a Legislature almost completely Republican.

During the World War, approximately 45,000 men from Colorado served in the army, navy and marine corps, of whom about 22,000 had been drafted. There were in the state 698,160 subscriptions to the Liberty and Victory loans, amounting to $144,813,550, which was 24% more than the quota.

COLOURS OF ANIMALS (*see* 6.731).—Since 1910 the knowledge of animal coloration has been added to in many directions. Broadly speaking, however, the new facts confirm the views previously held, which are only modified in points of detail.

Cryptic Colouring.—As regards cryptic coloration, A. H. Thayer and his followers have shown that many arrangements of colour and pattern which had been previously considered to be revealing, are in truth concealing. A few biologists go so far as to express the view that all coloration is concealing and explain all cases of the mimicry of one animal by another, as due to a common cryptic (syncryptic) coloration, both animals having independently developed the same concealing coloration. Apart from mimicry, there are great difficulties in maintaining this thesis. The habits of many brilliantly coloured animals clearly prove that they do not seek to hide themselves but rather to show off their bright colours.

Mention may be made of the method of concealment by disruptive coloration first described by Thayer. This is for the concealment of animals likely to be seen against two or more backgrounds. An animal, for instance, coloured green and brown in large areas, when viewed against a green background will be visible in respect of its brown areas, and as these brown areas will not have the shape of the animal but will be like one of the many oddments of nature (stones, leaves, etc.) so the animal will be mistaken for one of these. It will be similarly concealed against a brown background: in this case, only the green areas will be noticed. In these cases concealment is effected by disrupting the characteristic outline of the animal. The white areas which many animals present, are considered to be for disruption against the background of the sky, as, for instance, when a partially white bird in a tree is viewed against the low horizon. Many experimental findings and field observations form the basis of these conclusions.

Another use of pattern is to give a blurred or indistinct appearance to an outline. It is common to find, along the margin of the wings of butterflies and moths, a very small black and white, or contrasted, pattern which is visible at short distance; at longer range the pattern blends and then the margin has an indistinct appearance, causing the insect to fade into its background. The finely spotted, barred and striped patterns of many mammals and birds are similarly effective in concealing the outlines at distance the spots cannot be seen.

The solidity of an animal is concealed by what is now called counter-shading, namely, by the darkening of surfaces exposed to the light, and the whitening of those in shadow. Large dark spots or broad dark stripes on the back, gradually changing to small spots and narrow stripes on the under sides, has the same concealing effect and the added advantage of a blurred outline when the animal is viewed at a distance. The very remarkable striped pattern of the zebra has been considered to be of this nature. In some animals not only is their solidity thus concealed, but a false solidity or modelling is superimposed. A flat surface is often made to appear rough or uneven: this is effected by an arrangement of light or dark tones used in a manner precisely similar to that by means of which the artist produces the delusion of a solid object on a flat canvas.

The use of colour in animal coloration can at present only be very imperfectly understood because little is known of the colour vision of animals. There is some evidence that animals have a colour perception less sensitive than man: if such prove to be the case, then a ready explanation for several dimorphisms is available. For instance, among insects it is common to find that whilst some individuals of a species are green, others are brown; but towards a colour perception slightly less sensitive than man's, these colours will be indistinguishable, and thus against either green or brown backgrounds neither the brown nor green individual would have the advantage. A common defect in man's colour sense is an inability to distinguish red from green; it is possible that such a colour as the red of the robin's breast against green foliage may serve to conceal the bird from its enemies.

When bright colours are used for revealment, as shown by the animal's habits, and by the particular pattern and position which the colour occupies, then advantage appears to be taken of the fact that red is a very conspicuous colour at high illuminations and blue at low illuminations. The brilliant inhabitants of the forest present a preponderance of blue, whereas red is more often found among those living in the open. This also applies to flowers, the bluebell typifying the colour for woods and the poppy for the open.

Experiments have shown that it is possible to determine, in many cases, whether a given pattern is for concealment or revealment: for instance, it has already been mentioned that concealment may be effected by a pattern which breaks out along the animal's margin and thus tends to conceal its characteristic shape. Conversely, patterns which follow an animal's margin and tend to accentuate its characteristic shape and separate it from its surroundings, make for revealment. A pattern of this kind, commonly seen in butterflies, is a broad black band following the outer margins of both wings and often enclosing a brilliant yellow or blue central area. Experimental evidence of this kind, as well as that derived from a study of an animal's habits, is strongly against the view that all coloration is for concealment.

The concealment of cast shadow is commonly brought about by the crouching or squatting of either hunted or hunter. Among butterflies Marshall has pointed out two methods of avoiding cast shadow: Certain species when resting on the ground with closed wings will tilt over the wings, generally away from, sometimes towards the sun, thus reducing and hiding the shadow cast upon the ground. Other species will settle on the ground with wings spread and orient themselves so that either their head or more often their tail is pointed at the sun. Should a bird or other enemy come near they at once close the wings over the back and then only a line shadow of the wings is cast on the ground.

Sematic Colouring.—Passing on to the consideration of sematic or signaling coloration, certain advances have been made. Feeding experiments have shown that the preyed-upon can be arranged in a series, for any given preyer, from the most to the least palatable. The former will be eaten when the preyer's hunger is almost satisfied; the latter, only when the preyer is starved. The colours of this series are then found to be arranged from cryptic coloration corresponding to the very palatable, to a revealing (warning) coloration for the very unpalatable. Further, it has been observed that in many cases, whilst concealment by a cryptic coloration is the usual form of protection, nevertheless, a revealing coloration is exhibited to the preyer, when concealment has failed. This revealing coloration, such as the hind wing of a moth, is as a rule hidden by a cryptically coloured fore wing, and is only revealed at the last moment to advertise a relative unpalatability. There is also evidence obtained from watching feeding birds, that revealing coloration is used for deception in the manner of a conjuring trick. Thus, the Leaf butterfly (Kallina) when flying appears blue and yellow, but directly it settles with closed wings it becomes like a dead leaf: the pursuing bird will continue to look for the blue and yellow insect among the dead leaves in which the insect has taken

refuge. Many grasshoppers and moths look red and blue when flying, but on settling, these bright colours are at once hidden.

Swynnerton has suggested the substitution of "distinctive coloration" for "warning coloration"; the assumption is that the preyer will remember the distinctive colours and patterns, and associate them with their varying palatability. In support of this there is much evidence to show that many animals have a good memory in this respect.

Mimicry.—In view of the fact that insects can he graded in respect of their palatability, the distinction between Mullerian and Batesian mimicry appears difficult to maintain. A set of animals presenting common warning coloration (Mullerian mimicry) are never equally unpalatable, and therefore it may be said that the relatively palatable of this set are of the nature of Batesian mimics. Although in extreme cases a distinction may be drawn, nevertheless intermediate cases occur which it is impossible to classify in this way. In the study of mimicry many notable advances have been made, chiefly among butterflies. Several insects which were thought to be different species, or varieties, have lately been shown by breeding-experiments to be polymorphic forms: the same species mimicking sometimes one species and sometimes another, both forms being bred from the same mother. Also it has been shown that, in situations where models are scarce, the mimicking species presents transitions between its various polymorphic forms, and this fact is considered to indicate that natural selection is required to maintain a mimicry. At one time it was thought that butterflies had few enemies, and that therefore their remarkable mimicry could bear no relation to natural selection; however, evidence that they are eaten by birds to a considerable extent has been brought forward by several observers.

Sexual Coloration.—Secondary sexual coloration still gives rise to much speculation. The Darwinian view that it represents selection by the female is still held by some observers. Others consider that it serves the purpose of stimulating the sexual instinct of the female; or that it is related to the different habits of the male and female, as, for instance, the incubation of eggs; or that it represents a difference in value to the species between male and female, making the conspicuous but less valuable male more likely to be destroyed by enemies than the inconspicuous and valuable female. These various theories are mentioned to show that no general law to explain these colorations has been accepted. Much valuable field work has been done in which many new facts as regards sexual displays have been collected.

Chemistry of Animal Colours.—It has been shown that, in the case of the lobster and salmon, the colours which the males assume at the breeding-season are due to the laying down of a coloured waste product in the scales and shell. This waste product is finally got rid of when the scales become worn and the shell cast. In the case of the female the waste product is discharged in quite a different manner; it is deposited in the eggs and disposed of when they are laid. In certain parts of England and Germany, chiefly in the neighbourhood of large towns, many species of moths have developed melanotic forms, or these dark forms have greatly increased in number. Much work has been done in an endeavour to discover the cause of this change, as it was at one time thought to be a case of the acquirement of a dark coloration for concealment against sooty surroundings, and thus to be an example of the rapid action of natural selection. Melanism, however, occurs in other districts, distant from large towns, more particularly near the sea. Recently evidence has been brought forward that this change is due to the particular feeding of the caterpillar; that, in fact, a deposit occurs on the leaves near large towns and near the sea, which causes this change.

Physics of Animal Coloration.—Several eminent physicists have taken an interest in, and attempted to explain on a physical basis, the brilliant metallic and iridescent colours of many insects and birds. Although a physical explanation of the coloration of most objects is available the brilliant colours of these animals remains a mystery. A recent summary by the late Lord Rayleigh in the *Philosophical Transactions* may be quoted:—"These colours are probably structural rather than pigment, but still much remains to be effected towards a complete demonstration of the origin of these effects. Even if we admit an interference character questions arise as to the particular manner and there are perhaps possibilities not hitherto contemplated."

It has been suggested that fluorescence plays a part, and to test this insects have recently been examined in a beam of ultra-violet light. It was found that the brilliantly coloured species are not fluorescent. A few Lepidoptera were found to be fluorescent and this character has been found to be of some service in classification, as the property appears to be limited to closely allied species when it occurs in a group.

COLOUR-VISION AND COLOUR-BLINDNESS (*see* 28.139).—Much new work has been done in research on these questions, which have become increasingly important in practical life; and a restatement is needed (1921) of the accepted views.

The Physical Basis of Normal Colour-Vision.—White light can by means of a prism be split up into its constituent parts to form a spectrum which shows a number of colours. The spectrum or rainbow consists of a series of waves of light of different refrangibility extending from the red, which are the largest waves, to violet, which are the smallest. These waves are similar to those of the sea, only infinitely smaller. Similar waves, differing in size and not giving rise to a sensation of light, are found above the violet and below the red. In the visible spectrum we have a physical series arranged in consecutive order, each member of the series differing in wave-length.

Special Physiological Facts in the Appearance of the Spectrum.—If a number of persons be asked to state how many definite colours they see in the spectrum, very different answers will be obtained. The large majority will say that they see six colours, red, orange, yellow, green, blue and violet. A few will state that there are seven colours, indigo being added as a colour, being seen in the region of blue-violet. Newton appears to have seen the spectrum in this way.

The spectrum may be examined in another way, certain portions of it being isolated between two shutters. An extraordinary fact then becomes apparent, viz. that large divisions of the spectrum appear monochromatic, as if they had been painted with one brush of colour, though physically every part of the division differs. Most normal-sighted persons divide the spectrum into about 18 monochromatic divisions: those with super-normal colour-perception, into about 25, and those with diminished colour-perception a less number. For instance, those who see three colours in the spectrum generally divide it into ten monochromatic divisions. These divisions when examined by a normal-sighted person appear quite wrong and to contain several colours instead of one. It is obvious that a man who sees only ten colours instead of 18 will confuse colours which appear different to the normal-sighted.

The Anatomical Basis of Vision and Colour-Vision.—It is upon the outer layer of the retina, the membrane lining the back of the eye, that the images of external objects are formed. The outer layer of the retina is the layer farthest away from the front of the eye, so that light has to pass through all the other layers before it reaches the sensitive portion. This sensitive layer consists of two elements, which are called respectively, on account of their shape, the rods and cones. A little dip in the centre of the retina, the fovea, is the region of most distinct vision. In the fovea only cones are present. External to the fovea the rods are arranged in rings round the cones, and the proportion of rods to cones increases as portions of the retina farther from the fovea are taken, except at the extreme periphery where, again, only cones are found. In the outer segment of each rod there is a rose-coloured substance, the visual purple, which is photochemically sensitive to light. This visual purple is not found in the cones, but only in the rods. It was for this reason that it was not considered to be essential to vision, because it was absent from the cones, and only cones are to be found in the fovea, the region of most distinct vision. Though the visual purple is not present in the cones of the fovea, it is found between them, four special canals aiding the flow from the periphery to the centre of the fovea. When there is no visual purple in the fovea it is blind. The rods and cones project into a thin layer of fluid, which is kept in its place by a membrane.

The visual purple is diffused into this liquid and on being decomposed by light stimulates the cones, thereby setting up a nerve

impulse, which causes the sensation of vision. The movements of after-images show that the stimulus in vision is fluid and situated outside the cones. The rods are not percipient elements but regulate the formation and distribution of the visual purple.

The decomposition of the visual purple by light stimulates the ends of the cones, and a visual impulse is set up which is conveyed through the optic nerve fibres to the brain. The character of the impulse differs according to the wave-length of the light causing it. Therefore in the impulse itself we have the physiological basis of the sensation of light, and in the quality of the impulse the physiological basis of the sensation of colour. The impulse being conveyed along the optic nerve to the brain stimulates the visual centre, causing a sensation of light, and then, passing on to the colour-perceiving centre, causes a sensation of colour. But though impulses vary in character according to the wave-length of the light causing them, the colour-perceiving centre is not able to discriminate between adjacent impulses, the nerve cells not being sufficiently developed.

Even with the normal-sighted there is room for much further development in the discrimination of colour, but when the development is not up to the normal standard or there is a defect in any portion of the apparatus diminishing the power of discrimination, colour-blindness is the result.

Evolution of the Colour-Sense.—There can be no doubt that an evolution of the colour sense has taken place. The only point is, how, and when, did this occur? It is obvious that in those low forms of animal life in which the most rudimentary sense of sight exists there can be no sense of colour. The animal which can only perceive light and shade, can only discriminate in a rough way between varying intensities of the stimulus. It is obvious, therefore, that the sense of light must have been developed first and then the sense of colour. The sense of sight must have been first developed for those waves which produced their maximum effect upon the sensitive protoplasm.

The next process of development would be for the protoplasm to become sensitive to the waves above and below those which first caused an effect. In the physical stimulus which produces the sensation of light there are two factors to be considered, the length of the wave and its amplitude; the greater the amplitude within certain limits the greater the intensity of the sensation.

The wave-length of the physical stimulus is the physical basis of the sensation of colour. How did the sensation of colour first arrive? Let us suppose that the physiological effect of the physical stimulus differed according to the wave-length of the physical stimulus. At a certain stage the eye had become sensitive to a fair range of the spectral rays, that is to say, evolution had proceeded to the extent of making the protoplasm sensitive to rays of light considerably above and below those which first caused a sensation of light. There was then an eye which was sensitive to the greater part of the rays which form the visible spectrum. It was, however, an eye which was devoid of the sense of colour, no matter from what part of the spectrum the rays were taken. The only difference appreciated was one of intensity. Let us now suppose that a fresh power of discrimination was added to the eye and that it became able to discriminate between different wave-lengths of light. What would be the most probable commencement of development of the sense of colour? Most probably the differentiation of the physical stimuli which were physically most different. That is to say, the eye would first discriminate between the rays which are physically most different in the visible spectrum, the red and the violet; that is, presuming that the eye had become sensitive to this range. We have examples of cases of defective light-perception in which there is shortening of the red or violet end of the spectrum.

Let us now work out the evolution of the colour sense on the assumption that the rays which are physically most different, namely red and violet, were those which were first differentiated. We know that the various rays differ in their effects on substances: the red rays are more powerful in their heating effects, whilst the violet are more active actinally, as is well known by the readiness with which they act upon a photographic plate.

We should now have an individual who would see the spectrum nearly all a uniform grey of different degrees of luminosity but with a tinge of red at one end and a tinge of violet at the other. There is a great deal of evidence to show that this is how the colour-sense was first developed. For instance, in the degree of colour-blindness just preceding total the spectrum is seen in this way.

It will be noticed in the first evolution of colour that the added power of discrimination is something distinct and separate from light-perception. It can be destroyed as by mixing the two colours without interfering with the perception of light. Here we have the foundation for the distinction between light and colour-perception, the proper recognition of which is so essential in physiological optics. As the colour-sense developed it was not necessary that the rays should be so far apart before a difference was seen, so the two colours red and violet gradually encroached on the grey band until they met in the centre of the spectrum.

We have now a series of cases each of which only sees two colours, red and violet, with a varying degree of grey band in the centre of the spectrum. We should expect that those who had the smallest white region left in the centre of the spectrum would have the best colour-perception, because they belong to a later stage of evolution.

Cases of colour-blindness are found corresponding to all these degrees, from almost total to those bordering on the trichromic.

In all the dichromics a mixture of the two colours which they perceive, namely red and violet, will form white, and so we have the foundation of complementary colours.

The next stage in the evolution of the colour-sense was when a third colour appeared at the third point of physiological difference, that is in the centre of the spectrum in the position of the green.

The colour-sense now assumed a trichromic form, red, green, and violet being seen in the spectrum.

As green replaced the grey which existed in the spectrum of the dichromic we should expect that green should be complementary to the other two colours combined, and this we find to be the case.

We have now reached the stage in which three distinct colours were seen in the spectrum, namely red, green, and violet, and the vision has assumed the trichromic character which must remain.

When the green was first developed it was a comparatively unimportant colour. As evolution proceeded the power of differentiation affected the regions between the red and the green and the violet until a stage was reached in which a fourth colour, yellow, was seen at the next point of greatest physiological difference.

The next step in the process of evolution occurred when the retino-cerebral apparatus was able to differentiate a fresh colour between the green and the violet, namely blue, five definite colours being seen in the spectrum. It will be obvious that in any further evolution the intermediate portions will be still further differentiated, and so we arrive at those who can see six and seven colours in the spectrum respectively.

It is not necessary to consider the further evolution of the colour-sense because it is not known that any person can distinguish more than seven definite colours in the spectrum.

Colour-Blindness.—Colour-blindness is not really a good term for the defect so named. Though in certain varieties there is actual blindness to colour, in the ordinary varieties colours are clearly seen and seen as colours, but there is a lack of power to differentiate between them: for instance, reds are confused with greens and greens with reds. A colour-blind man picked up a red-hot coal, remarking as he did so, "What funny green thing is this?" The case which first drew general attention to the subject of colour-blindness was that of Dalton, the famous chemist. After Dalton had received the scarlet gown of a doctor of civil law at Oxford, he actually wore it for several days in happy unconsciousness of the effect it produced in the street. When he was asked what the bright scarlet gown which he wore resembled, he pointed to some evergreens outside the window and said the colours were exactly similar to him. The lining of the gown, which was pink, he stated appeared to him sky-blue.

A soldier in the days when they wore scarlet coats took off his coat and put it on a hedge, and was quite unable to find it when he wished to put it on again, though it was the most conspicuous object in the landscape to other people. Many colour-blind golfers find great difficulty in recognizing the red flags on the greens at a distance.

Those who are colour-blind often first discover their defect as children by finding great difficulty in picking cherries or strawberries, because of the similarity in colour to their leaves. A colour-blind man has bought a bright green tie under the impression that he was purchasing a brown one; an artist has painted the face of a portrait green and trees red. A colour-blind man has written half of a letter in black ink and half in red ink, under the impression that the whole was written in black ink.

At first sight it would seem a very easy thing to detect persons who make such errors. Though this is true in certain cases it is not so in others. In fact, cases have been submitted to experts who have failed to detect them after an hour's examination.

A musician's wife informed the writer that she had tested her husband again and again and was quite sure that he was not colour-blind, and that he was able to see colours as well as she could; she was only convinced when she found that he was quite unable to read any of the letters on the card test.

Cases of colour-blindness may be divided into three classes, which are quite separate and distinct from each other though one or more may be present in the same person. In the first class there is light as well as colour loss. In the second class the perception of light is the same as in the normal-sighted, but there is a defect in the perception of colour. In the first class certain rays are either not perceived at all or very imperfectly. Both these classes are represented by analogous conditions in the

perception of sounds. The first class of the colour-blind is represented by those who are unable to hear very high or very low notes. The second class is represented by those who possess what is commonly called a defective musical ear. Colour-blind individuals belonging to this class can be arranged in a series. At one end of this series are the normal-sighted, and at the other end the totally colour-blind. In the third class of the colour-blind there is defective perception of colour through the fovea or central region of the retina not being normal.

Abnormalities and defects of light-perception may be subdivided as follows:—

1. Increase or diminution in the visible range of the spectrum.
2. Defective sensibility for certain wave-lengths.
3. Increased sensitiveness for certain wave-lengths.
4. Variations in the maximum of the luminosity curve.
5. Increase or defects in the power of dark adaptation—(a) Very rapid or slow adaptation; (b) very complete or imperfect dark adaptation.

If a number of persons be examined with a bright spectrum as to the point when they first see light where the red commences and the point where violet terminates, it will be found that there are considerable variations in different cases.

A very common mistake due to shortening of the red end of the spectrum is the confusion of pink and blue. If a person with considerable shortening of the red end of the spectrum is shown a pink which is made up of a mixture of red and violet, the red consisting of rays occupying the missing portion of the spectrum, only the violet is visible to him, and so the pink appears a violet without a trace of red. This pink is therefore matched with a violet or blue very much darker than itself.

An examination of those belonging to the second class of the colour-blind will show that those who are only slightly defective will declare that there are only five colours in the spectrum, orange not being seen as a definite colour, but as a yellowish-red. Another set will be found who will state that there are only four definite colours, red, yellow, green, and violet. Those who are still more defective will state that there are only three colours in the spectrum, red, green, and violet. These describe the spectrum as red, red-green, green, green-violet and violet. Then there are those who state that there are only two colours in the spectrum, red and violet, with a neutral point in the green. This neutral division between the red and the violet may in extreme cases be so large that only the ends of the spectrum appear coloured with a large grey region between. Finally there are persons who see no colours in the spectrum, but see it as a colourless band varying in luminosity in its different parts. It will be seen therefore that we can classify the degrees of colour-perception according to the number of definite colours which are seen in the spectrum. Those who see seven colours may be called heptachromic, those who see six, hexachromic, those who see five, pentachromic, those who see four, tetrachromic, those who see three, trichromic, those who see two, dichromic, and finally the totally colour-blind.

It might at first be thought that this classification was artificial and that some of the classes saw exactly alike, but further examination will show that this is not the case. Those who see six colours in the spectrum know that there are several varieties of green, but all these are associated by their green character, and are plainly compound and not simple colours; for instance, in yellow-green it is quite obvious that the colour is a mixture of yellow and green, and hence the term yellow-green correctly describes it. The trichromic designate yellow as red-green and this does not correctly describe yellow for the normal-sighted.

The Tests for Colour-Blindness.—On account of the arrangement of signals by sea and land it is necessary that persons employed in the marine and railway services should be able to recognize and distinguish between the standard red, green, and white lights, in the requisite conditions.

It is not only necessary to find out whether a man is able to distinguish between the red, green, and white lights, but to ascertain as well that he thoroughly understands what is meant by colour, and the individual character of red, green and white respectively. Too little attention has been paid to this in constructing tests for colour-blindness, and those who have had much practical experience in testing for this defect, are aware of the ignorance which exists among uneducated persons with regard to colours. Many are under the impression that every shade of a colour is a fresh colour, and others have the most novel ideas with respect to colours. It is necessary that a sailor or engine-driver should be able to recognize a red, green, or white light by its character of redness, greenness, or whiteness respectively; that he has definite ideas of colour and is able to reason with respect to them. All persons who are not able, through physical defect, to have definite ideas of the standard colours and to be able to distinguish between them, must be excluded from the marine and railway services. An engine-driver or sailor has to name a coloured light when he sees it, not to match it. He has to say to himself, "This is red light, therefore there is danger," and this is practically the same as if he made the observation out loud. Therefore, from the very commencement we have colour-names introduced and it is impossible to exclude them. Making a person name a colour is an advantage, because the colour-name excludes the element of shade. If, as some persons have said in the past, testing by colour-names is useless, then the whole series of colour-names is useless. But if I say to a friend, "That tile is red," and he agrees with me, it is evident that one object the colour of which is by him classed as red, is also classed as red by me. The ordinary colour-names, red, blue, yellow, and green, form excellent bases for classification. The engine-driver is told that red is a "Danger" signal, green an "All Right" signal. Therefore it is necessary that he should know what is meant by these colours. It is on account of there being so many variations in hue that such great difficulty has been found in constructing an adequate test for colour-blindness, as it is the definite colours and not the variation of them of which we wish to know the number. The colour-blind see a distinct difference in hue, luminosity and saturation. The normal-sighted could divide the green of the spectrum into yellow-green, green and blue-green, and would, in the majority of cases, be able to range all greens under these three classes. The dichromic colour-blind see two colours only, and name colours as variations of these two differing in luminosity and saturation; they recognize yellow by its superior luminosity and distinguish between red and green by the latter appearing of less saturation.

The test which should be used for the marine and railway services is a lantern in which the requisite conditions are represented. A lantern of this kind is used by the Admiralty and the Board of Trade. It is obvious that a man who cannot distinguish the red, green and white lights in these lanterns will not be able to do so in actual practice, and this fact is easily proved by testing with signal lights.

Another test for colour-blindness, a card test,[1] is useful but it is not intended for the decisive testing of sailors or railway men, though it may be used as a supplementary test. It is for use when the lantern is not available, and is probably the simplest for demonstrating to the normal-sighted person defective colour-vision in a subject. The principle involved is the perception of difference between two colours presented in a special diagram of spots of irregular shape and various tones. On a ground of separate spots of one colour a letter is formed in spots of another colour. The test consists in discriminating between the colours, and hence recognizing the letters.

This test is useful for children as it is of importance that anyone who is colour-blind should know of it at the earliest time, so that he can avoid occupations in which an accurate colour-sense is necessary.

The wool test is a failure. It is now obsolete, as it allows over 50% of dangerously colour-blind persons to pass, and it will be noticed in certain reports that of those who were rejected by the wool test and who appealed, over 50% were found to be normal-sighted and had been rejected wrongly. The colour-blind people who can pass the wool test see a slight difference between the colours, but the smallness of this is shown by the card test.

Theories of Colour-Vision.—The facts of colour-vision are quite inconsistent with the older theories of colour-vision, and modifications of the theories made to explain particular cases at once give rise to difficulties in the explanation of other facts. All fundamental observations should be made with pure spectral light as the use of coloured wools, coloured papers and pigments gives rise to results which are different and due to the defects of the methods employed.

The trichromatic theory, which assumes that there are three fundamental sensations the mixture of which gives rise to all other colour-sensations, was based on the facts of colour-mixing. Undoubtedly normal colour-vision is trichromatic in the sense of colour-mixing; therefore the term trichromatic theory is not a good one and has led to much confusion. The three-sensation theory would

[1] Published by G. Bell & Sons, London, 1920.

be a better term. The three-sensation theory is only one explanation of the fact that when spectral green and spectral red are mixed they make yellow. The explanation that when red and green are mixed the resulting impulses cannot be distinguished by the nerve cells from those caused by simple yellow is sufficient. This explanation is supported by the fact that the trichromic see yellow as red-green. There is no evidence that the assumptions of the three-sensation theory are true. Simple yellow cannot be split up into its hypothetical red and green constituents. An hour's dark adaptation does not alter the hue of spectral yellow. As blue is supposed to be made up chiefly of the green and violet sensations, and yellow to be made up chiefly of red and green sensations, the green element should be affected after fatigue with blue, and yellow viewed subsequently should appear red. This is not the case. The eye may also be fatigued with spectral yellow, so that all yellow disappears from the spectrum without affecting the appearance of a very feeble red. It is known that if the intensity of a number of coloured lights be reduced in the same proportion all the colours do not disappear at the same moment. If, therefore, spectral yellow were a compound sensation it should change colour on being reduced in intensity. If, however, spectral yellow be isolated in the spectrometer, and the intensity be gradually reduced by moving the source of light away, the yellow becomes whiter and whiter until it becomes colourless, but does not change in hue.

In cases where a subjective red is seen with an illumination by white light, this red is seen with a compound yellow but not with a simple spectral yellow.

When the theory is applied to colour-blindness it is still more unsatisfactory and is quite unable to explain the fundamental facts, as for instance why the colour-blind should make an increased monochromatic division in the spectrum or why certain colour-blind persons should be able to pass the wool test. Again no explanation is offered of the fact that simultaneous contrast is increased in the colour-blind. One of the best-known cases of colour-blindness, a simple dichromic, was classified by one expert as a case of complete red-blindness and by another as a case of complete green-blindness!

The present writer has never examined a single case of colour-blindness which, on a detailed examination with spectral colours, could be explained on the three-sensation theory. For instance, a case of shortening of the red end of the spectrum may be taken in which the red is shortened to $\lambda 680$; at $\lambda 670$ the perception of red may be defective to about half the normal and at $\lambda 660$ it may be quite normal. This can be proved with a colour-mixing apparatus with the equation $\lambda 670 + 535 = \lambda 589$. If red $\lambda 660$ be substituted for red $\lambda 670$ an absolutely normal match will be made; if red of $\lambda 670$ be used, twice as much red will be put in the mixed colour as with the normal, and if red of $\lambda 680$ be used a match is quite impossible in any circumstances. Now on the three-sensation theory a case of this kind may be classed as ·5 red-blind, all the ordinates of his red sensation curve being supposed to be reduced to one-half of the normal, but the red in the shortened portion should according to this hypothesis be brought up to the normal by doubling the amount of red, whereas it will be found when there is complete shortening that any amount of red light from the shortened portion may be added without being perceived. In another way it can be conclusively proved that the shortening is not produced by the diminution of a hypothetical red sensation which is stimulated by rays from every part of the spectrum. A man with shortening of the red end of the spectrum will match as identical pink and blue wools, the pink wool appearing much lighter to the normal-sighted than the blue one. If these two wools be now viewed through a blue-green glass which is opaque to the rays occupying the shortened portion, they will appear identical in hue and shade. It should be noted that whilst the blue-green glass cuts off the physical red rays it transmits numerous rays supposed to stimulate the red sensation.

When three selected spectral colours, for instance red, green and violet, are mixed in suitable proportions a white is made which will exactly match the white from which the spectrum was formed. On the three-sensation theory the two are physiologically identical, that is to say, the three hypothetical sensations are stimulated in similar proportions by the mixture and by the white light, though the two are physically different. It is essential to the three-sensation theory that after fatigue (say) to red or green the match should still remain, and supporters of the theory state that no change is observed in these circumstances. This, however, is not the case, and if a number of normal-sighted persons view the white equation after fatigue with red light, which is supposed to affect only the hypothetical red sensation, the match is no longer correct, and a very remarkable fact becomes apparent, namely, that much more red will be required in the mixed white.

The mixed white appears a bright green to a person whose eyes have been fatigued for red, and in order to make a match the amount of green has to be reduced to about one-half, so that the mixture now appears bright red to a normal-sighted person with unfatigued eyes.

COLUMBIA UNIVERSITY (*see* 6.739).—The work of Columbia University during the period 1910–20 was greatly extended. A school of journalism was founded in 1912, a school of business in 1915, and a school of dentistry in 1917. In order to render the largest possible service to the community, courses in university extension were organized for men and women who could give only a portion of their time to study, but who desired to pursue subjects included in a liberal education. These courses, as such, did not lead to degrees, but might be offered as credit toward a degree under one of the faculties. Under university extension there was organized also an institute of arts and sciences which conducted series of lectures and recitals of a popular nature, as well as a system of courses for home study for persons unable to attend classes in the university. These courses also did not lead to academic credit or degrees. In 1920 there were in Columbia University in all departments 1,150 instructors and administrative officers, and in the twelve months ending June 30 1920, 28,314 students were enrolled. Of these, roughly one-third were registered in the 1919 summer session; one-third in the degree-granting schools and faculties during the academic year 1919–20; and one-third in university extension during the academic year 1919–20.

The productive endowment of the university, including the endowments of Teachers College, Barnard College, and the College of Pharmacy, amounted in 1920 to $47,000,000, which, added to the property occupied for educational purposes, made a total capital investment of $72,000,000. To meet the increased costs of education, the fees in the several schools were raised so that they ranged in 1921 from $250 to $350. The alumni of the university were given a definite part in the government of the institution by an agreement under which six of the 24 trustees were elected on alumni nomination. In 1912 the corporate title of the university was changed from the "Trustees of Columbia College in the City of New York" to the "Trustees of Columbia University in the City of New York."

The university took an active part in the World War. Immediately upon the severance of diplomatic relations with Germany in Feb. 1917, it placed its resources, both physical and intellectual, at the service of the Government. There were established at the university schools for training men for both the army and the navy, including work in radio, photography, quartermaster's routine, explosives, gas engines, submarine detection, and the Student Army training corps, which prepared men for the various officers' training camps of both armed services. Students, faculty and alumni to the number of 4 125 were enlisted in the army and navy, and 2,175 left their previous occupations and assisted the Government in some one of the civilian branches. Two hundred Columbia men died in the war. (N. M. B.)

COLVIN, SIR SIDNEY (1845–), English man of letters (*see* 6.748), was knighted in 1911, and retired from his position in the British Museum in 1912. In 1911 he published an edition of the *Letters of R. L. Stevenson* and in 1917 *John Keats, His Life and Poetry*. His autobiographical *Memoirs and Places* appeared in Nov. 1921.

COMBES, [JUSTIN LOUIS] ÉMILE (1835–1921), French statesman (*see* 6.751). The campaign for the separation of Church and State was the last big political action in his life. While still possessed of great influence over extreme Radicals, M. Combes took but little public part in politics after his resignation of the premiership in 1905. He joined the Briand Ministry of Oct. 1915 as one of the five Elder Statesmen, but without portfolio. He died May 26 1921.

COMMERCE, DEPARTMENT OF, one of the executive departments of the U. S. Government. It succeeded the earlier Department of Commerce and Labor, by an Act of Congress, approved March 4 1913, which also created a separate and independent Department of Labor (*see* LABOR, DEPARTMENT OF). The Secretary of Commerce is a member of the president's Cabinet but is not in line of succession to the presidency. It is his duty to promote the commerce, domestic and foreign, of the United States. There is also an assistant secretary and a solicitor, the latter acting as legal adviser to the Secretary and to the heads of the various bureaus of the department.

As originally organized there were 9 bureaus, as follows: (1) The bureau of the census, charged with the collection of data concerning population, agriculture, manufactures, mining, etc.; (2) the bureau of foreign and domestic commerce, for the collection and diffusion of information of use to the manufacturer and exporter; (3) the coast

and geodetic survey, for charting coast waters and surveying rivers to the head of tidewater or ship navigation and for making deep-sea soundings, magnetic observations, etc.; (4) the bureau of fisheries, for regulating and conserving fisheries; (5) the lighthouse service, in charge of the aids to navigation on all U.S. territory, except Panama and the Philippines: (6) the bureau of navigation, having general superintendence of the commercial marine and merchant seamen, and the enforcement of navigation laws; (7) the steamship inspection service, which inspects steam vessels for the purpose of insuring safety at sea, and issues licences to masters, mates, pilots, and engineers of the merchant marine; (8) the bureau of standards, for determining all American measurements: and (9) the bureau of corporations. The last-mentioned bureau, on March 16 1915, was transferred to, and merged with, the Federal Trade Commission (*see* FEDERAL TRADE COMMISSION).

Because of the importance of manufactures there had long been agitation among various commercial organizations of the United States for the creation of a governmental department for promoting commercial interests; but it was not until 1903 that a bill establishing the Department of Commerce and Labor was passed by Congress; it was approved by President Roosevelt Feb. 14. For the next ten years the joint interests of labor and capital were entrusted to this department. The arrangement proved unsatisfactory because of the frequent conflict of these interests, and in 1913 an independent Department of Labor was created, the name of the Department of Commerce and Labor being changed to Department of Commerce.

COMMUNISM (*see* 6.791).—The term "communism" is used loosely to cover all forms and theories of social ownership of wealth, but has a more specific current meaning to denote the type of revolutionary socialism first expounded in *The Communist Manifesto* of Marx and Engels (1847) and to-day held by the various communist parties that exist in most countries and are united in the Communist International. Communism is thus both an old term and an old theory; but the practice of the Bolshevik revolution in Russia (*see* BOLSHEVISM) and the subsequent propaganda of the Communist International have given it a significance that is in many ways new.

It is important to distinguish at the outset the various senses in which "communism" is often used, in order to avoid the confusions that beset the term. The English writer, Sidney Webb, has distinguished five senses of communism:—(1) the communism of free use, or "all things in common," as exemplified on a limited scale in public roads and bridges, and as aimed at on a general scale in religious or utopian "communities" of all ages; (2) communism by rationing, or the equal distribution of some particular thing or things among the whole population; (3) communism in treatment, or the supply of some particular service, not equally, but according to need, as in the public provision of medical care or education; (4) communism in the sense of nationalization or municipalization; (5) the communism of *The Communist Manifesto*. To these should possibly be added the anarchistic communism of Kropotkin and his school, to which the name of "anarchism" was formerly given (*see* 1.914).

It is only the last of the five senses given above (the communism of *The Communist Manifesto*) which will be treated here, since the other senses either do not cover a specific political theory or else are coterminous with Socialism in general. It alone has a continuous history and a present significance.

Historical Development.—The conditions which gave rise to communism began with the industrial revolution. The social transformation produced by that event, the emergence of a new middle class and its rise to power, and the creation of a growing town population of wage-earners in large industry, led to numerous movements of unrest in the early 19th century and to all kinds of social theories and questionings. At this time the term socialism became applied to various types of theories of a benevolent or coöperative economic order. These theories, however, formulated mainly by individual thinkers in England and France, had no direct relation to the movement of the masses. The new feature introduced by communism was its direct correlation of social theory with the struggle of the working class. The necessity for this was making itself felt in various quarters; but its first clear expression was given to the world in what is still the classic statement of communism, *The Communist Manifesto* of Marx and Engels, written in Nov. 1847. The year 1847 thus marks the starting-point of communism as a conscious force.

The Communist Manifesto.—The Communist Manifesto opens with the statement that the history of all hitherto existing human society has been the history of successive class struggles, which have on each occasion either resulted in the revolutionary transformation of society or in its collapse. From the slave systems of ancient civilization to the feudal system of mediaeval society, and from that in turn to the rule of capitalism or the bourgeoisie, there has been on each occasion a new class rising to power out of the conditions of the old society after a violent and revolutionary struggle with the preceding class. The rise to power of the bourgeoisie is described in rapid outline, its origin from the bosom of feudal society, its breaking of the bonds of feudalism and monarchy, its revolutionizing of the methods of industry, agriculture and communication, its establishment of modern industry with its accelerated and concentrated production, extended franchise, the national state and the international trade, and finally its subjugation of the whole world to its mode of production. "It has achieved greater miracles than the construction of Egyptian pyramids, Roman aqueducts or Gothic cathedrals; it has carried out greater movements than the migration of peoples or the crusades. . . . Although it is scarcely a century since it became the dominating class, the bourgeoisie has created more powerful and more gigantic forces of production than all past generations put together."

Yet to-day the bourgeoisie finds itself threatened in its turn by the new class of the proletariat or wage-earners which its own method of production has created. Like the systems which preceded it, capitalism has created the forces which, in the communist view, will lead to its overthrow: the proletariat, ever growing in numbers and in the insistence of its demands, and an anarchical system of production leading to periodical crises, unemployment, gluts and overproduction in the midst of famine and misery, and (a modern communist would add) in its last phase the fierce struggles of imperialism and the havoc of world war. It is contended that these contradictions of capitalism[1] reveal that the forces of production have outstripped the existing conditions of social organization, and are producing goods faster than society can control the use of them under the existing laws of property. Social production has been established, but individual appropriation of the results still remain. The contradiction receives expression in the class struggle of the workers against the capitalists. The proletariat, being without property and living in a régime of increasing social production, can no longer fight for individual ownership, but only for the socially conducted utilization of the means of production belonging to the community and of the goods produced. Thus capitalism has created in the

[1] To explain the "contradictions" of capitalism would demand an examination of Marxian economic theory for which there is here no room. It must suffice to say that Marx saw in the wage system a system by which monopoly in the means of production is used to compel those outside the monopoly (the proletariat) to sell their labour in return for subsistence and forego all rights to the actual value produced. The resulting surplus provides new capital for yet more production on the same system, but always with the need of finding new markets, since the workers themselves, only receiving in wages a portion of the value produced, can only buy back a portion of the value produced; with the result that, while the early stages of capitalism show rapid expansion and development, opening up the whole world and forcing every nation and race into the circle of its operations, the later stages show increasing crises of overproduction and rivalry in markets, tremendous concentration of financial power, and, in the last phase, the continually intensifying struggles of imperialism culminating in world war and world economic disorganization. In this progress capitalism by its own development has completely destroyed the basis of private property from which it began. Originating in private property and competition, it has eaten up the independent small proprietor and replaced him by tremendous combines, replaced competition by monopoly, reduced the masses of the population to the position of a proletariat which in a régime of private property is without private property, and finally reached a stage of production whose forces it is no longer able to control, any more than it can control the proletarian masses who now begin to rise against its domination. Thus all is ready for its dissolution and for the replacement of its worn-out basis of private property by the new basis of social ownership in accordance with the new mode of production and through the agency of the new class, the proletariat, which has no knowledge of private property. (For a different view of the capitalistic system, *see* CAPITALISM.)

proletariat a social class which can only have as its object the abolition of the capitalist system of ownership and its replacement by the proletarian system of common ownership.

But there is this new feature in the struggle and future victory of the proletariat, that, whereas all previous class struggles have resulted simply in the rule of a new minority—the rise to power of a new separate stratum of society—the victory of the proletariat carries with it the emancipation of the whole of humanity, because there is no remaining class below them to be freed. The struggle of the working class is thus the struggle of the humanity of the future, and this is the secret of the class basis of all communist thinking.

It is with this struggle that the communists identify themselves, not as any special party, but simply as the champions of the interests of the working class. They believe that just as each succeeding class has won to power only after violent and revolutionary struggle with the preceding class, so the working class can never realize its aims save by the violent overthrow of the capitalist class and its whole system of power. "The communists disdain to reveal their aims and intentions. They declare openly that their ends can only be attained by the forcible overthrow of every obtaining order of society. Let the ruling classes tremble before a communist revolution; the workers have nothing to lose by it but their chains. They have the world to win. Workers of every land, unite!"

The Later Period of Marxism.—In *The Communist Manifesto* may thus be traced all the characteristic conceptions of Marx: the materialist conception of history (not to be confused with either materialism or economic determinism), the doctrine of the class struggle, and the theory of the revolutionary transference of power to the proletariat. At the same time the analysis of the rôle of capitalism, which was to be worked out later with a wealth of detail in the pages of *Capital* (1867), is already briefly indicated, and in a rapid forward glance the prospect is presented of a transition through the revolutionary rule of the proletariat to a classless society. It remained in his later work to give elaboration and precision to these original conceptions in the light of the experience of European history and the working-class struggle for the next generation. These writings have particular reference to two dominant events, the revolution of 1848 which led in Paris to the first distinct attempt of the working class to seize power in "the days of June," with the consequent coalition of all the bourgeois forces into a single "Party of Order," and the Commune of Paris in 1871 when for the first time the working class held power for six weeks. The later developments in Marx's historical and other writings are of especial interest for the new light they throw on the practical questions of the communist attitude to the State and the conception of the dictatorship of the proletariat (a phrase which did not take shape till after the writing of *The Communist Manifesto*, its first appearance in Marx's writings coming in 1850).

The modern State has already been described in *The Communist Manifesto* as the "executive committee for administering the affairs of the capitalist class as a whole." The experience of the 19th-century revolutions appears to have convinced Marx that it was idle to expect any fundamental change so long as the apparatus of the existing State was left unaffected. Alike in writing of 1848 and of 1871 he stresses the necessity for destroying and shattering the existing machinery of the State. The one and only amendment of substance to *The Communist Manifesto* that he makes in his last preface to it before his death, written in 1872, is to declare that "One thing especially was proved by the commune, namely, that the working class cannot simply lay hold of the ready-made State machinery and wield it for its own purposes." But he demands not merely the destruction of the existing State, but its replacement by a new type of State, a Workers' State or the dictatorship of the proletariat as the transitional organ to carry through the change to communist society:—

"Between capitalist society and communist society there lies a period of revolutionary transformation from the former to the latter. A stage of political transition corresponds to this period, and the State during this period can be no other than the revolutionary dictatorship of the proletariat." (Critique of the Gotha Programme, 1875.)

This new State will be based on the workers' organizations:—

"Against this new official Government," Marx wrote, in describing the tactics for communists during a revolution in its first stages, "they must set up a revolutionary workers' government, either in the form of local committees, communal councils, or workers' clubs or committees, so that the democratic middle class government not only immediately loses its support among the working class, but from the commencement finds itself supervised and threatened by a jurisdiction behind which stands the entire mass of the working class." (Address to the League of Communists, 1850.)

On the other hand the proletarian State is in its nature temporary, because, in proportion as it carries out its task of suppressing class distinctions it destroys its own class basis, and the State as a special organ of class power and coercion gives way to the machinery of a homogeneous communist society. It is only in this second phase of communism that freedom becomes realizable.

The First and Second Internationals.—While the main body of communist doctrine was thus receiving its completed form, the first attempts were being made at giving expression to communism in working-class organization. The First International (1864–73) was not a Marxian body; it was a coming together of various types of working-class organization and theory; but from the first Marx played a leading part in it, he drafted its principal declarations, and his ideas became more and more dominant within its ranks, until the controversy with the anarchist Bakunin led to its break-up. The First International was the battle-ground in which Marxism established its supremacy as the social philosophy of the working class. By the time of its demise in 1873 the seed of Marxian socialism had been sown in the working-class movements of Europe.

When the movement towards international working-class organization was resumed with the formation of the Second International in 1889, Marxian socialism was now assumed as the natural basis. Henceforward the class struggle and the transference of power to the proletariat were the statutory objects of international working-class organization. But meanwhile, beneath this apparently rapid victory of Marxism, a deep change in conditions had taken place. The movements that came together in the Second International were no longer the scattered sections of a handful of pioneers in working-class organization. They were powerful national organizations of the workers, numbering their adherents in millions. Thus the second stage had been reached of winning the masses to organization; but the work of training in the principles of the revolutionary struggle still remained. This was the task begun, but never fully achieved, by the Second International, as the war revealed. The peaceful conditions of the period led to hopes of peaceful progress and a gradual transition to socialism without the disastrous necessities of catastrophic change. It was not until the World War, with the collapse that it brought to the ideals of peaceful progress, that communism appeared once more in its full force and with all the revolutionary implications with which Marx had left it.

The War and Bolshevism.—The World War, then, is the starting-point of modern communism. The war forced to the forefront in an acute form the issues and divisions that had been latent in the socialist movement. It was no longer possible for the great national movements to maintain their dual allegiance, at once to the existing national State which they hoped some day to control, and to the international class war which they had still continued to proclaim in their resolutions. So there came the division of forces, the division of majority and minority which manifested itself in every belligerent country. The bulk of the official parties supported the war, and in consequence found themselves involved in closer and closer alliance with the Governments. Sections in each country, and in some cases (notably Italy and Russia) the majority, were in opposition.

This division, which began as a difference over the issue of war and peace, soon developed into a deeper opposition. It was not possible for one side to support the war without entering into closer and closer relations with the whole administration of the

existing Governments; it was not possible for the other side to oppose the war without implying a denial of the whole conception of the existing national State. As the division developed, its revolutionary implication became more and more manifest; the Zimmerwaldian organization of anti-war socialists, which had been founded as a temporary substitute for the collapsed International at a conference at Zimmerwald in Switzerland in 1915, gradually evolved from an organ of international peace and working-class solidarity into an organ of international revolution and working-class struggle.

It was the Russian revolution that finally brought this new division to a head. The Russian revolution forced into the realm of actual decision the old controversies of class war or class peace, working-class government or democracy. The party which proclaimed its stand on the Marxian principles of class struggle and working-class government was the Russian Social Democratic party (Majority) or Bolsheviki. (From this title of Bolsheviki, meaning "Majority," derived from their holding the majority at the Brussels-London Conference of the Russian Social Democratic party in 1903, has been formed the word "Bolshevism" as a current popular expression for communism and a loose journalistic term for all forms of extremism and violence.) Against the other socialist sections who maintained a coalition with the bourgeoisie, the Bolsheviki carried through the second revolution of Nov. 1917, and established a new form of government based on the Soviets or workers' councils. With this government they proclaimed the inauguration of the dictatorship of the proletariat, and maintained their power against a series of attacks from without and within. From thenceforward they became the natural leaders of the revolutionary working-class movement of the world. As the revolution spread to other countries, the division in the socialist world became more and more complete, and in 1919 the Third or Communist International was founded on the basis of the revolutionary working-class struggle. The old Marxian term communism was thus revived against the social democracy which Marx and Engels had always declared an unsuitable description for a movement which stood for the suppression both of the State and of democracy, and which the communists regarded as having been a cover for the betrayal of the socialist cause. At the Second Congress in 1920 a detailed statement of communist aims, policy and tactics was drawn up; and communism finally came into existence as a fully organized world force.

The Modern Communist Outlook.—The First Manifesto of the new Communist International describes the modern communist outlook. It sees in the ruin of the World War and the peace that succeeded it the fulfilment of the Marxian prediction of the catastrophic destiny of capitalism. Capitalism, it declares, torn by its own contradictions, has plunged into the agony of world war; but war has brought no solution to its problems, just as peace has brought no relief. Hardly has the last war ended before the next war is being prepared; imperialist rivalry continues with more intensity than ever; economic disorganization spreads apace. There is no way out save the complete ending of the system of imperial capitalism that compels these results, and its replacement by the world organization of production on the basis of the workers. "This is the epoch of the decomposition and break-up of the world capitalist system, which will mean the break-up of European culture in general if capitalism with its irreconcilable antagonism is not destroyed." The war has brought the populations of the world face to face with the realities of capitalism: what was before the theory and speculation of a few has become the bitter experience of millions. "The contradictions of the capitalist system were converted by the war into degrading torments of hunger and cold, disease and savagery for all mankind." They have seen the vanity of the hopes of peaceful progress in face of the iron onward sweep to destruction of the existing system. "The catastrophe of imperialist war has with one swoop swept away all the gains of experts and of Parliamentary struggles." Not only the populations of Europe, but the colonial populations of Asia and Africa, have been dragged into the vortex, and are now finding their only chance of liberation in the international communist revolution. In the midst of this world upheaval there is need of a strong revolutionary power that can alone form the coherent force to carry through the necessary change and establish the new system. Reaction solves nothing, and half-measures are fatal. "Only the proletarian dictatorship, which recognizes neither inherited privilege nor rights of property, can shorten the period of the present crisis, and for this purpose will mobilize all materials and forces, introduce the universal duty to labour, establish the régime of industrial discipline, and in this way heal in the course of a few years the open wounds caused by the war and raise humanity to undreamt-of heights." It is the conditions of society that are producing chaos and revolution; it is the object of the communists to end those conditions by giving conscious direction to the instinctive forces of revolt, instead of vainly seeking to stem them. No error, in fact, could be greater than to suppose that the communists are out to "make" a revolution in order to impose their system upon mankind. "The Communist parties, far from conjuring up civil war artificially, rather seek to shorten its duration." In the communist conception the alternative to proletarian dictatorship is not peace. It is war and blockade, famine and disease, blind revolts and the break-up of civilization.

Communism and Democracy.—It is from this point of view that the controversy of communism and democracy should be approached if the communist position is to be understood. The communists do not reject the current conceptions of democracy because they believe in the superiority of the few, but because they believe that the phrases of democracy bear no relation to present realities. The divorce between the realities of power and the theory in modern democratic states has been noted by observers of all schools; it is the special point of the communist to insist that this divorce is not due to accidental and remediable causes, but is inherent in the nature of capitalist democracy. Democracy, in fact, is held to be unrealizable in capitalist society because of the fundamental helplessness of the propertyless man; the parliamentary forms only serve to veil the reality of the "bourgeois dictatorship" by an appearance of popular consent which is rendered unreal by the capitalist control of the social structure; and even this veil is cast aside in moments of any stress by the open assumption of emergency dictatorial powers. The plea that this situation may be remedied by education and propaganda is met by the reply that all the large-scale organs of education and propaganda are under capitalist control.

On the other hand communism, while rejecting current democracy, differs from syndicalism and other revolutionary philosophies which proclaim the right of the "militant minority" to endeavour to change society. The glorification of the minority and of the *coup d'état* really belongs to the Blanquist school, which was always vigorously opposed by Marxism. Marxism taught that the liberation of the workers could only be the act of the workers themselves, and that all the communists could do was to endeavour to guide the struggle of the workers into its realization in the dictatorship of the proletariat. In this way the Bolsheviki did not carry through their revolution of Nov. 1917 until they had gained the majority in the Soviets and the trade unions. Where the communists differ from other believers in the ultimate victory of the working class is that they do not believe that victory will be achieved until after a very much more severe struggle than is ordinarily contemplated. They believe that the ruling class will use every means, political, economic and military, to defend its privileges, and that the final decision will not be reached without open civil war. In support of this they quote evidence to show the readiness of the ruling class in many countries to fling constitutional considerations to the winds when their privileges are in danger. To mistake dislike of this prospect for evidence of its improbability they regard as a fatal policy, and they believe it necessary, therefore, to make preparations for the event, considering the best guarantee against the chaos of prolonged social disorder (otherwise inevitable in the period of capitalist dissolution) to be the existence of a powerful revolutionary party. It is this aspect of communism which has led to the current distinction between communism and other forms

of socialism as a difference of method: but it will be seen that this difference of method arises from a far more fundamental divergence in outlook and philosophy. The methods of the communists are not comprehensible save in relation to the whole philosophy of *The Communist Manifesto*.

Communist Organization.—From the above considerations certain conclusions follow as to the rôle and character of the communist party in any country. The fully organized communist party, it is stated, is to be the "advance guard" of the working class, never regarding itself as separate from the working class, always working in and through existing working-class organizations on the plane of the struggle of the moment, but always coördinating and giving conscious direction to the different aspects of the working-class struggle with a view to the larger ultimate issue. For this purpose it must be based on the strictest internal discipline, and on severe conditions of membership; but this internal strictness of theory and discipline must be accompanied by an external policy of revolutionary opportunism which is in contrast with the usual "purism" of the revolutionary sect. This is the explanation of the alternate charges of "doctrinairism" and "opportunism" which are levelled by other socialists against the communist party. This discipline is ultimately international in character, because the struggle is regarded as international. To the communist the International is more than a coming-together of sympathetic parties in a common struggle: it is the union of different divisions in a single army, each with its own tactical problems, but all with a single ultimate directing centre. For this reason an absolute ultimate authority is vested in the International Executive, subject to the World Congress. This authority of the International is regarded as of particular importance, not only for the immediate struggle, but as the nucleus of future international authority in the World Soviet Republic.

Bibliography.—The classic statements of communism are contained in the writings of Marx and Engels: in particular, *The Communist Manifesto* by Marx and Engels (1848); *The 18th Brumaire* (1852); *Capital* (1867); *The Civil War in France* (1871) and the *Critique of the Gotha Programme* (1875) by Marx; and *The Origin of the Family, Private Property and the State* (1884) by Engels. *The Life and Teaching of Karl Marx* by Max Beer (1918, English translation 1921), gives a valuable short summary of his theories. The controversial literature of Marxism is very extensive, and would need a special bibliography. The most important documents of modern communism are the writings of Lenin, especially *The State and Revolution* (1917) and *Left Communism, an Infantile Disorder* (1920); the writings of Trotsky, including *The Russian Revolution to Brest Litovsk* (1918); Bukharin's *Programme of the World Revolution* (1920), and other writings of the Russian leaders; and the publications of the Communist International, including the *Congress Manifestoes* (1919 and 1920), the *Theses and Statutes of the Communist International* (1920) and the monthly organ *The Communist International*. Presentations by English workers of communist theories may be found in R. W. Postgate, *The Bolshevik Theory* (1920) and E. and C. Paul, *Creative Revolution* (1920). For criticisms of communist theories see Karl Kautsky, *The Dictatorship of the Proletariat* (1919); J. R. Macdonald, *Parliament and Revolution* (1919), and Bertrand Russell, *The Practice and Theory of Bolshevism* (1920). (R. P. D.)

COMPASS (*see* 6.804). In view of the large extension of the field covered by the term "compass" due to the introduction of the "Gyro Compass" and its adoption for navigational purposes, it is essential to define exactly what is meant by a word which is being very loosely applied to instruments of no practical navigational value.

The compass is an instrument designed to seek a certain definite direction in azimuth and to hold this direction permanently. For use in navigation, a compass must satisfy the following practical requirements:—

Magnetic.—When disturbed should return to within 1° of the above direction within 2 minutes of time.

Gyroscopic.—When disturbed or started should return to within 1° of the above direction within 3 hours.

Magnetic Compass.—The description given in the earlier article may be taken as generally applicable to the magnetic compass of the present day; a very great extension, however, in the use of the "liquid" type for nautical purposes has since taken place, while for aeronautical use the liquid compass is essential. The British Admiralty compass department now occupies the "Compass Observatory" at Langley, Bucks., and deals with compasses of all types both for the Admiralty and Air Ministry. A comprehensive museum is now attached to the observatory.

Gyro Compass.—The gyro compass is an instrument in which use is made of the rotation of the earth and the properties of a rapidly spinning body to indicate some fixed direction relatively to the earth. Up to the present the only successful models have been definitely North-seeking, and all such compasses consist essentially of:—

1. A wheel mounted so as to be capable of spinning rapidly without vibration about its axis and also free to point that axis in any direction.
2. A gravity control of some description which restricts the tilting freedom of the axis of the wheel.

Modern gyro compasses differ somewhat in the mechanical devices by which the degrees of freedom of the axis are obtained and in the methods adopted to provide the gravity control; but they are all the practical outcome of experiments made in 1852 by Foucault to demonstrate the rotation of the earth by means of a gyroscope. Edward Sang, of Edinburgh, had described in 1836 how this could be done, but he did not actually carry out the experiment. Much later, in 1884, Lord Kelvin exhibited a model gyro compass before the British Association. Early in the present century the development of submarines called for a non-magnetic type of compass, and fortunately the advance in electrical and mechanical science made it possible for Dr. Anschutz to utilize this pioneer work and evolve the first practical gyro compass. In this instrument a single gyro was used and both the tilting and the azimuthal freedoms were obtained by attaching to the gyro case a float supported in a bath of mercury. A full account of this compass and the elementary mathematical theory of it is to be found in Crabtree's ***Spinning Tops and Gyroscopic Motion***. The chief objection to this compass was its failure to function correctly if the ship was rolling, especially when on a quadrantal course. This intercardinal rolling error was, for some time, a stumbling-block to further progress, but in modern gyro compasses it is almost non-existent.

Anschutz in 1912 brought out a very different instrument which was adopted by the German navy. In this model three gyros are used in place of the single one of the earlier model, the two extra gyros having been introduced to overcome the rolling error.

About the same time, the Sperry Co. of New York put on the market their gyro compass. The first model was found, on trial, to be subject to rolling error and this necessitated an alteration in design, a small gyro-pendulum, called the ***floating ballistic***, being introduced. This compass, in its modified form, was very largely used by the British and Allied navies during the war.

More recent types are the Brown, Carrie and Twin Sperry. The first is an entirely British-made compass and has many novel features; in particular, the device used to obtain the azimuthal freedom and the gravity control. It is small and light, the whole as fitted in the binnacle weighing about 15 pounds.

Certain very important modifications of the Sperry compass were developed by the Admiralty compass department as a result of war experience, especially the mercury control attachment invented by Commander G. B. Harrison, O.B.E., and Mr. A. L. Rawlings; this simplifies the construction of the compass, reduces its cost and makes it more efficient, particularly in bad weather (fig. 4).

The most important constants of the Anschutz, Brown and Sperry wheels are as follows:—

	Mass in lb.	Radius of Gyration in inches.	Rate of Spin in r. p. m.
Anschutz	6	1·85	20,000
Brown	4½	1·57	15,000
Sperry	50	4·62	8,600

Precession.—So far as gyro-compass work is concerned the phenomenon of precession may be described in the following manner. If a torque is applied to a free gyro in any plane passing through the gyro-axis then the axis will precess in a plane perpendicular to the plane of the torque and also to the plane of the

spin; and the sense of the precession is such that it causes the plane of the spin to move towards the plane of the torque as if to secure agreement of sense after one quarter-turn.

The Sperry Compass.—The Sperry type being the most universally known is used in the following discussion as a convenient example to illustrate the principles of gyro compasses. It consists essentially of a gyro mounted so as to be free to spin, free to tilt about a horizontal axis and free to turn in azimuth round a vertical axis. The tilting freedom is modified by the addition of a gravity control in the form of a *bail weight,* fastened to the case by a roller connexion at one point only.

For the present it will be assumed that this roller connexion is in the vertical plane through the gyro-axis, so that whenever the gyro-axis is tilted the gravity control only produces a torque on the gyro in the vertical plane. On account of the earth's rotation the N. end of the gyro-axis will, whenever it is $\left\{\begin{matrix}\text{East}\\ \text{West}\end{matrix}\right.$ of the meridian be tilting $\left\{\begin{matrix}\text{upwards}\\ \text{downwards}\end{matrix}\right.$; and as a result of the gravity control, whenever the N. end of the axis is tilted $\left\{\begin{matrix}\text{above}\\ \text{below}\end{matrix}\right.$ the horizontal plane it must be precessing $\left\{\begin{matrix}\text{East}\\ \text{West}\end{matrix}\right.$. This precession, however, is relative to space and not relative to the earth.

It follows that such a gyro compass will have, at the equator, a resting-position in which the gyro-axis is horizontal and in the meridian. At a place in N. lat. the gyro-axis, in its resting-position, will be in the meridian with the N. end tilted up slightly, so that the gravity control may provide a torque in the vertical plane sufficient to cause the gyro-axis to precess in azimuth at a rate equal to that at which the meridian is turning round the vertical.

With the Sperry constants the tilt required is about 8′ of arc in lat. 53°, for this tilt produces a torque of $\frac{8}{60}\times\frac{\pi}{180}\times\frac{320}{2}$ ft.-poundals and so a rate precession equal to $\frac{8\times 160\times 3600}{60\times 7\times 900}$ degrees per hour or about 12° per hour. (Mass of bail = 10 lb.; depth of C. G. below tilt axis = 6 in.)

Further, if the gyro-axis is disturbed from its resting-position it will oscillate about that position but will not settle again unless there is sufficient friction to damp out the oscillations. Such friction must always be reduced to a minimum as it involves a degree of uncertainty in the resting-position.

In order to damp out any oscillations of the gyro-axis the roller connexion between the bail weight and the case is placed slightly to the E. of the vertical plane through the gyro-axis. This roller connexion will, in what follows, be referred to as the "eccentric pivot." With this arrangement whenever the N. end of the gyro-axis is tilted above the horizontal plane there are two torques acting on the gyro, both proportional to the tilt:

(a) one in a vertical plane as before,
(b) the other in a horizontal plane.

The second torque is the damping torque and always acts in the sense opposing the precession in azimuth due to the first torque. Its effect on the gyro is always to reduce the tilt whether above or below the horizontal plane. By reducing the tilt it lessens the torque producing the azimuth precession and so diminishes the amplitude of the azimuth movement and consequently damps out the oscillations.

The angle between the two planes through the gyro-axis which pass through the slope diameter and the eccentric pivot respectively is called the *eccentricity of the pivot,* and is usually about 1°. By increasing this eccentricity the damping can be made heavier, the value 7° being enough to give to the Sperry compass a dead-beat movement in all latitudes.

The damping torque causes the compass to settle, in N. latitudes, with the N. end of the gyro-axis tilted up and E. of the meridian. This damping error, or latitude error as it is sometimes called, varies as the eccentricity of the pivot and the tangent of the latitude. In the resting-position the damping torque maintains the slight precession of the gyro-axis in the vertical plane necessary to keep the tilt constant although the axis is not in the meridian.

The resting-position in any latitude can be adjusted to be horizontal and in the meridian by putting out the horizontal balance of the case. Imagine a weight put on the N. side of the case sufficient to produce the torque in a vertical plane required to keep the gyro-axis precessing at the same rate as the meridian is turning round the vertical. Then in the resting-position there would be no tilt and so no pressure at the eccentric pivot, no damping torque and no damping error. That is, the gyro would settle with its axis horizontal and in the meridian. This gives a clue to the effect of a change in the horizontal balance on the resting-position—making this balance N. heavy reduces the upward tilt of the N. end and causes it to settle to the W. of its normal resting-position.

In a similar way can be seen the effect of a twist in the suspension. This merely introduces an extra torque in a horizontal plane and so either increases or decreases the damping torque and therefore the damping error. Hence the only effect on the resting-position is to introduce a change in azimuth in the sense of the twist.

The preceding remarks refer to a compass in a binnacle fixed relative to the earth. When the binnacle is mounted in a ship further complications arise. That part of the earth's rotation which is essential to the working of a gyro compass is the tilting movement of the horizontal plane about a N.-S. line. This tilting movement in combination with the gravity control causes the gyro compass to be N.-seeking. If the ship, in which the compass is mounted, is steaming due N., the curvature of the earth's surface causes a tilting movement, sense S.-Z.-N., of the horizontal plane about an E.-W. axis; the gyro compass detects this tilting movement and on account of this alone would point its N. end west. The final result is that the gyro-axis points in the direction of the axis of the resultant angular movement. Since the angular velocity of the horizontal plane due to the ship's speed is only a small fraction of that due to the earth's rotation, this direction will be only slightly W. of N. Hence for northerly speeds the compass has a resting-position which is W. of its normal one. This error is called *speed error* and its value in radians is given approximately by the expression

$$\frac{\text{Northerly speed of ship}}{\text{Easterly speed of the latitude circle}}.$$

For British latitudes it is roughly 1° per 10 knots. The error for southerly courses is E. and for east or west courses it is zero. Thus it is clear that every alteration of course will involve a change in the resting-position of the compass. Take the case of a ship which, when steaming N. at 20 knots, alters course to S. The gyro compass, supposed settled when the ship was on the northerly course, would be pointing some 2° W. of its normal resting-position; at the end of the turn the new resting-position will be 2° E. of the normal one and so 4° E. of that for the northerly course. But during the turn there has been a southerly acceleration, and consequently a tendency for the bail weight, acting as a pendulum in the N.-S. plane, to lag behind to the north. Hence it exerts a pressure (due to the acceleration) on the case at the eccentric pivot, and so produces two torques on the gyro:

(1) in a vertical plane sense N.-Z.-S.;
(2) in a horizontal plane sense W.-S.-E.

The former of these causes the N. end to precess E., that is toward the new resting-position for the southerly speed. The angular displacement of the gyro-axis thus obtained is called the *ballistic deflexion.* If the constants of the compass are so arranged that this deflexion is equal to the difference of the two speed errors, then during the turn the gyro-axis will have moved in azimuth exactly to its new resting-position. But the ballistic deflexion is independent of the latitude, whilst the change of speed error varies with the latitude. Hence this adjustment can only be made correctly in one particular latitude called the *standard latitude.* To obtain this effect the constants of the compass must be adjusted so that its undamped period is 85 minutes in the standard latitude. This is the reason why all gyro compasses of this type have periods approximating to 1½ hours.

The torque in the horizontal plane produces no such beneficial results. It causes an upward precession of the N. end during the turn and so increases the tilt. Since the resting-position for the S. speed requires the same tilt of the N. end as that for the N. speed, the gyro-axis will begin to wander, after the turn is completed towards the west. This wander, called the *ballistic tilt effect,* is always opposed in sense to the ballistic deflexion. It also occurs in the Anschutz and Brown compasses because the acceleration causes a transference of the oil in the damping mechanism. In order to reduce this ballistic tilt effect the eccentricity of the pivot is kept small in the Sperry compass.

The mercury-box attachment to the Sperry compass provides a means of making the ballistic deflexion approximately correct in all latitudes, and is noteworthy as being the only practical device which so far has overcome this difficulty. The gravity control consists of two cast-iron boxes containing mercury and joined together by a long U tube which enters each box at the bottom. This is essentially a top-heavy form of gravity control and the magnitude of the torque exerted by it depends on the area of the free surfaces of mercury in the boxes. Each box is divided by vertical partitions into three compartments whose areas are as 1:2:3. A valve at the bottom of the box, actuated by turning a knob at one bottom corner, enables the area of the free surface—and so the magnitude of the bail weight—to be varied in the ratios 3:4:5:6. By means of this device the bail weight can be so adjusted that the ballistic deflexion is equal to the change of speed error within ½° in any navigable latitude.

Further complications arise due to the rolling and pitching of the vessel. A swinging ring oscillates stably in its own plane but unstably in a perpendicular plane. This is because the moments of inertia of the ring, about a diameter and about a line through the centre at right angles to the plane of the ring, are not equal. This inequality existed in the original Sperry compass but was removed by the attachment of the compensator weights and frame to the vertical ring. In addition, with the ship on an intercardinal course, say N.E., and rolling, the compass in the binnacle is subject to an alternating acceleration in the N.W.-S.E. vertical plane. The E.-W. component of this causes the compass as a whole to swing in the gimbals in the plane of the case, and so the eccentric pivot swings E. and W.

of its true position relative to the vertical through the gyro-axis. The N.-S. component causes the bail-weight to exert an alternating pressure on the case at the eccentric pivot, first N. then S. These two alterations, the E.-W. swing of the pivot and the N.-S. pressure at the pivot, keep step, and so a torque of invariable sign in a horizontal plane is produced. This causes the gyro-axis to tilt and wander and so introduces *rolling error*. To get rid of this error Sperry aimed at eliminating the E.-W. swing of the pivot by making use of a small gyro pendulum, called the *floating ballistic*, to form the connexion between the bail weight and the case. This fitting gave excellent results except in bad weather; a further modification, obtained by the addition of a frame, carrying a lead weight, to the stem of the pendulum, in order to raise its centre of gravity and so increase its period, produced a great improvement. Even sn the compass was not quite reliable in really bad weather, and it was not until the mercury control was fitted that the intercardinal rolling error was finally overcome. In this device the period of the liquid pendulum is so arranged that the forced oscillations of the mercury due to the rolling of the ship are approximately 90° out of phase with the roll, and so complete compensation is obtained.

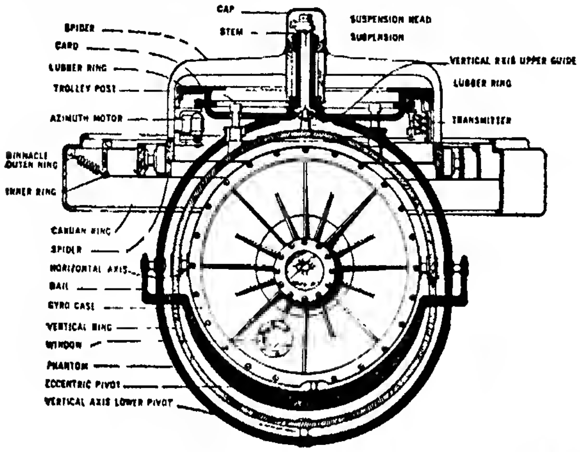

FIG. 1.—Thwartship section of frame. South view of compass.

Mechanical Operation of the Compass.—In the Sperry compass a follow-up system is essential to the correct functioning of the master compass; in other types, such as the Brown and Anschutz, this is not the case. The reason for this lies in the different methods of suspension, all of which must be as nearly free from friction as possible, as has been previously stated.

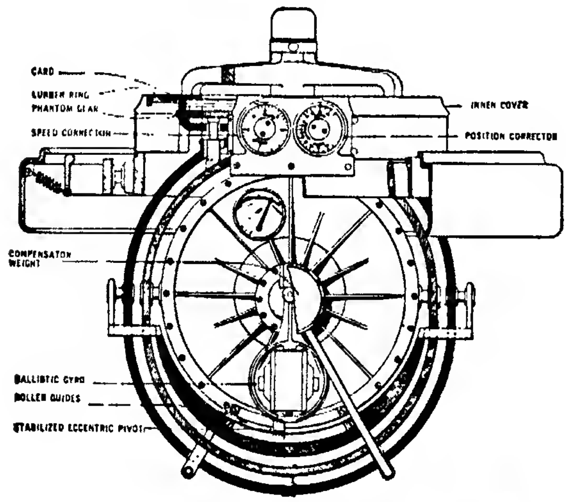

FIG. 2.—Aft view of frame. North view of compass.

The gyro and case in its vertical ring, known as the *sensitive element* (see figs. 1, 2 and 3), is supported from the top of the phantom or follower ring by a wire suspension. The vertical ring is also provided with upper and lower guide bearings in the phantom. These bearings do not support any of the weight, the whole of which is taken by the suspension. Suitable trolley contacts (not shown in the diagram) are carried on the trolley posts and work over fixed contactors situated opposite them on the upper part of the phantom. The compass card is fixed to the top of the phantom ring and the rack just below it gears into the azimuth motor which is fixed to the frame or *spider*. The trolley and fixed contactors are suitably connected to the relay of the azimuth motor.

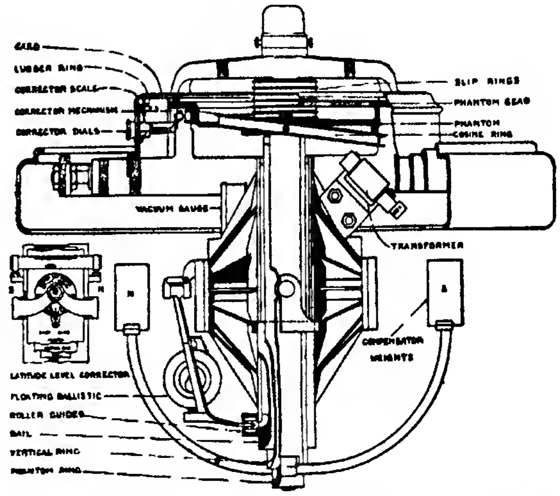

FIG. 3.—Starboard view of frame. West view of compass.

This electrical follow-up system operates so as always to keep the phantom co-planar with the vertical ring. If the gyro precesses in azimuth the trolley wheel is carried to one side or other of the fixed contactor which is insulated in the middle; this operates the azimuth motor through the relay and moves the phantom which carries the compass card, to follow the gyro. On the other hand, when an alteration of course takes place the phantom is at first carried round by the ship until the contacts cause the azimuth motor to drive it back to its normal position in relation to the vertical ring.

In addition to the master compass, which is usually placed more or less centrally in the ship and near the water line, repeater compasses form part of an equipment and may be placed in any convenient position.

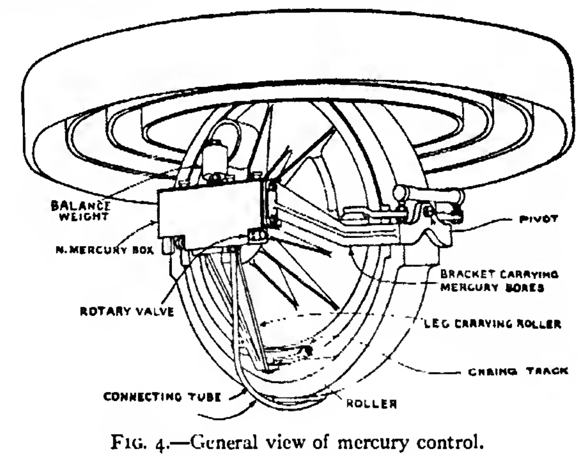

FIG. 4.—General view of mercury control.

They are worked through a transmitter which is operated by a pinion working into the phantom rack just under the compass card. This pinion forms the head of a camshaft which carries three double-faced cams set 60° apart. These cams operate contacts which, using a common return, work the repeater motor. The speed and latitude dials in conjunction with the cosine ring provide an automatic correction for both speed error and damping error, by turning round the lubber ring through an angle equal to the sum of these errors.

As seen from the S. side the direction of rotation of the wheel is clockwise, but this must be reversed when the mercury control is fitted, because this form of gravity control is top-heavy.

References.—For a detailed description of the whole equipment and instructions as to the care and maintenance of the Sperry compass, the Sperry *Handbook*, 2nd ed. Feb. 1919, gives full information. This, and a handbook on their Twin Compass, may be

obtained from the Sperry Gyroscope Co., Ltd., 15, Victoria Street, London, S. W. 1., 40, Flatbush Ave., Brooklyn, N. Y., by whose permission their copyright diagrams of the Sperry compass are produced in this article. Messrs. S. G. Brown, Ltd., of Victoria Road, North Acton, have also published a small pamphlet on their compass. Several types of gyro compasses can be seen in operation at the Admiralty Compass Observatory, Langley. (F. C.-O.)

COMPAYRE, JULES GABRIEL (1843–1913), French educationalist (*see* 6.809), died March 23 1913.

COMPTON, EDWARD (1854–1918), English actor, was born in London Jan. 14 1854. He was the son of the actor Henry Compton (Charles Mackenzie) and was educated at Kensington. He married Miss Virginia Bateman, an actress and a member of a well-known theatrical family. He first appeared at Bristol in 1873 and in London in 1877. In 1881 he organized the Compton Comedy company, which for over 30 years played Shakespearean and old English comedies throughout the country and formed a valuable school of training for young actors and actresses. He died in London July 16 1918. Among his children were Mr. Compton Mackenzie (b. 1883), the well-known novelist, and Miss Fay Compton, the actress.

CONNAUGHT, ARTHUR WILLIAM PATRICK ALBERT, Duke of (1850–), 3rd son of Queen Victoria (*see* 6.950), went in 1910 to S. Af. to open the Union Parliament on behalf of King George V. He was appointed in 1911 to succeed Earl Grey as governor-general of Canada, retiring from this office in 1916. In Dec. 1920 he went to India as the representative of King George in order to inaugurate the provincial legislative councils of Madras, Bengal, and Bombay, arriving at Madras Jan. 10 1921. In various speeches he sounded a note of conciliation with Indian progressive feelings, and it was agreed on his return to England that valuable help had been given by his utterances to the work of self-government in India under the new régime.

The Duchess of Connaught died in London March 14 1917. The Duke's only son, Prince Arthur of Connaught (b. 1883), married in 1913 Princess Alexandra, Duchess of Fife, daughter of the Princess Royal, who had succeeded in 1912 to her father's dukedom by special remainder. Prince Arthur was in 1920 appointed governor-general of the Union of S. Africa. The Duke of Connaught's elder daughter, Princess Margaret (1882), was married in 1905 to the Crown Prince of Sweden, and died at Stockholm May 1 1920. The younger daughter, Princess Patricia (b. 1886), married in 1919 the Hon. Alexander Robert Maule Ramsay, third son of the 13th Earl of Dalhousie. Princess Patricia of Connaught resigned her royal title on her marriage, and elected to be known as Lady Patricia Ramsay.

CONNECTICUT (*see* 6.951) had in 1920 a pop. of 1,380,631, as compared with 1,114,756 in 1910. The increase for the decade was 23·0%, as compared with 14·0% for the whole United States, and was the highest percentage of increase for Connecticut of any decade up to that time. In 1900 the pop. per sq. m. was 181·9; in 1910, 231·3; in 1920, 286·4.

The populations and percentages of increase of the important cities during the years 1910–20 are as follows:—

	1920.	1910.	Increase Per cent.
Bridgeport	143,538	102,054	40·6
Bristol	20,620	9,572	116·4
Hartford	138,036	98,915	39·6
Meriden	29,842	27,265	9·5
New Britain	59,316	43,916	35·1
New Haven	162,519	133,605	21·6
New London	25,688	19,695	30·7
Norwalk	27,700	6,954	299·0
Norwich	22,304	20,367	9·5
Stamford	35,086	25,138	39·6
Torrington	20,623	15,483	33·2
Waterbury	91,410	73,141	25·0

Agriculture.—In 1900 40·1% of the population was classed as rural by the census; in 1910 34·4%, and 1920 32·2%. The farming population was actually somewhat smaller than even these figures would signify. In 1900 the farms of the state numbered 26,948, in 1910 26,815 and in 1920 22,655, a loss of 4,160 in the latter decade. During the decade 1900–10, the state lost 126,295 ac. held in farms, or 5·5% of the total area of the state. Moreover, 76,273 ac. of improved land, 7·2% of the total, were allowed to go back to forest. In spite of this decline, the total value of farm property increased by 40·7% during the decade. In 1910 the average value of land per ac. was $33.03; in 1920 it was $53.28. The most important crops of the state are hay, corn and tobacco. The rapid growth of the cities has stimulated dairying, market gardening and egg raising. During the World War a Farm Bureau was introduced into each of the counties of Connecticut. It is one of the most important factors in the state, making for better farming and the solution of the local agricultural problems.

Manufactures.—Connecticut is one of the preëminent manufacturing states. From 1909 to 1914 the increase in the total of its manufactured products was 11·3%. In 1914 this value was $545,471,517. Connecticut, although the 46th state in size, was in 1914 12th in the value of its manufactured goods. The *per capita* value was $454 as compared with $245 for the United States. In 1914 the state contained 4,104 manufacturing establishments employing an average number of 226,264 wage-earners, and was the 8th among the states in number of wage-earners. The five most important branches of manufacturing were the following:—

Products Manufactured.	*No. Establishments.*	*Value of Products.*
Brass, Bronze and copper goods	67	$69,353,103
Foundry and machine-shop products	388	67,009,127
Cotton goods	50	30,808,918
Silk goods	44	30,591,825
Firearms and ammunition	13	25,657,797

The outbreak of the World War speedily brought profound changes to Connecticut manufacturing. Inevitably, large war orders of the belligerent nations were placed in Connecticut. Not only did munitions plants grow, but many other factories benefited by making accessory parts such as springs for shells, bases for machine-guns, etc. A rough measure of the effect of the new stimulus is to be found in the building projects of the state. During the years 1913 and 1914, 254 manufacturers constructed 386 buildings at a cost of $6,288,230. In 1915 and 1916, 294 manufacturers built 627 buildings at a cost of $18,277,825, nearly three times the amount of the preceding two years. The expansion continued during 1917 and 1918, when 386 manufacturers engaged in 738 building operations at a cost of $13,837,802, but in the summer of 1920 it came practically to an end as a result of the post-war depression setting in at that time. In May 1918 Gov. Holcomb stated that 80% of Connecticut manufacturing was "directly or indirectly engaged in producing munitions, rifles, machine-guns, clothing and other articles used by the army; and we have at least five plants within our borders where ships and power-boats are being constructed." With the signing of the Armistice and the cancelling of war orders, Connecticut factories began to reorganize. The readjustment to a peace footing was made easier by the great demand for manufactured goods that characterized the year 1919, and had been practically completed throughout the state when the depression of 1920–1 brought a considerable slowing up of productive effort. The growth of manufacturing, coupled with the increase in the cost of living that followed the outbreak of the World War, brought labour troubles to Connecticut. Before the war the wage-earners of the state were not well organized, labour organizations totalling in 1912 59,895 members. The bulk of these organizations were among the skilled trades and the transportation workers. Factory employees were in general not unionized. In 1911 and 1912 the state suffered only 48 strikes and in the next two years 45. In 1915 and 1916, the years of the great expansion, there were 422 strikes, involving approximately 68,000 employees. In the next two years there were 183 strikes involving 33,391 employees. From that time until 1921 strikes diminished in number until the depression of 1920–1, when because of wide-spread unemployment they practically ceased. The rapid changes in the manufacturing situation from 1918 to 1921 and the constant shifting of the wage-earning population made it difficult to collect statistics of value regarding the labour organizations. In 1918, however, there were 327 labour organizations in the state, mostly among the skilled trades and transportation workers. The most important result of the war-time labour disturbances was a general increase in wages. The attempt to increase the number, size and power of unions met with but indifferent success.

Government.—In 1911–2, the 34th and 35th, and in 1915–6 the 36th, amendments to the Connecticut constitution were adopted. The first stated the conditions under which the lieutenant-governor was to take the place of the governor; the second provided that the General Assembly should adjourn not later than the first Wednesday after the first Monday of June; the third allowed the passage by the General Assembly of a law to cover payment of mileage to the legislators. In 1914 a workmen's compensation law was passed, which applies to all industries in which five or more persons are employed. Compensation for total disability is one-half the employee's weekly wages, compensation to be not less than $5.00 nor more than $14.00 per week, and in no case to run for more than 520 weeks; compensation for partial temporary disability not more than half the weekly wages, compensation not to run more than 112 weeks; permanent partial disability, at same rates; in case of death, graded benefits. The law is enforced by Compensation Commissioners,

appeals from whose findings may be made to the superior court of the county. In the physical examinations for the draft during the World War, 20·79% of those examined were disqualified for physical disability, Connecticut being the seventh highest state in this percentage. On investigation it was found that many of the disabling disorders were due to preventable conditions in childhood. The result was the appointment of a commission to report a programme for child welfare. The commission reported in 1921. It was found at the same time that 37·21% of all Connecticut registrants under the draft law were aliens. Only one state had a higher percentage. The result of this situation was a vigorous movement for the Americanization of aliens.

Education.—Beginning July 15 1909, the organization of public education changed from the district type to that of town management. There were in 1921 less than ten townships in the state that had not availed themselves of the law. Under township management all schools of the township are under the direction of the town school committee. Appropriations for the support of the schools are made at a town meeting. The plan has resulted in better and more uniform advantages for school children. Compulsion was made more rigid by the enactment providing that after Sept. 1 1911 no employment certificate of any description could be accepted by any employer except such as were issued by the State Board of Education. On July 1 1917 a law went into effect providing that all new public-school teachers pay annually 5% of their salary into a pension fund. At the end of 35 years (changed to 30 in 1919), the last 15 of which must be within the state, or on reaching the age of 60, the teacher might retire and receive the annuity which his or her contributions and accrued interest would warrant. To this the state would add as a pension a sum equal to the annuity. Special provisions were made to apply to public-school teachers already in service at the time of passage. In 1911 a charter was granted for a woman's college at New London, and in 1914 it was opened as the Connecticut Woman's College, with Dr. F. H. Sykes as president.

In 1920 the corporation of Yale University announced the establishment of a Department of Education in the graduate school, designed among other things to train "superintendents, supervisors, principals, directors of special activities, research specialists, normal and college instructors in education and class-room teachings." For further information regarding YALE UNIVERSITY, see that heading.

History.—In 1913 it became known to the public that the financial condition of the New York, New Haven, and Hartford railway was unsound. The dependence of the people of the state on the road was made clear by a statement of the road's president, Mr. Howard Elliott, that in 1913 the road controlled 942 of the 1,000 m. of steam railroad in the state, and in addition was interested in separately operated trolley lines aggregating 605 m. out of a total of 911 miles. This dependence was augmented by the fact that (to quote Gov. Holcomb) "the securities of this corporation are quite largely owned and held by women and children, in trust funds, and by our insurance companies who purchased them as a safe, conservative investment." The change in the financial affairs of the railway brought its stock rapidly from far above par to much below. The suffering caused was general and very considerable. Public opinion forced a change of management.

When the United States was finally compelled to sever diplomatic relations with the Imperial German Government (Feb. 3 1917), Gov. Holcomb requested the Legislature (Feb. 6 1917) to provide for a census of men of military age, the object being to determine not only the number of such men but their occupations, previous military training, nationality and whether or not they were citizens. It was the pioneer military census within the United States and served as a model for those of other states. The Home Guard of Connecticut, formed March 9 1917, rose to 10,000 men. During the summer of 1917 the 26th Division was organized from the New England National Guard. Of the units in that organization the following came from Connecticut: the 1st and 2nd Conn. Infantry became part of the 102nd Infantry; two batteries of Conn. Field Artillery became part of the 103rd Field Artillery; the Conn. Cavalry became part of the 101st Machine-Gun Battalion; and the 1st Conn. Field Hospital and 1st New Haven Field Hospital became part of the 101st Sanitary Train. The division established its headquarters in France at Neufchâteau, Oct. 31 1917. It participated, among other actions, in the Aisne-Marne, the St. Mihiel and the Meuse-Argonne offensives. During the formation of the 26th Division, preparations were being made for the National Army. The 1st Provisional Training Regiment was organized at Plattsburg, N. Y., May 15 1917. To this regiment Connecticut sent her officer candidates to train for commissions. On Aug. 25 1917 the 76th Division was organized at Camp Devens, Ayer, Mass., its officers below the rank of lieutenant-colonel being drawn almost entirely from the 1st Provisional Training Regiment. The bulk of the drafted men from Connecticut went originally to this division. In July 1918 the division established headquarters in St. Amand-Mont-Rond, France, and became the 3rd Depot Division. The number of Connecticut men drafted under the Selective Service Act was 34,574; this figure does not include the numerous volunteers in the armies of the United States or of the Allies. The number who died were 1,305. The amount subscribed by Connecticut in the five War Loans was $437,476,103, an amount $137,557,803 above the state's quota.

Connecticut failed to ratify either the 18th (Prohibition) Amendment or the 19th (Woman Suffrage) Amendment to the Constitution of the United States. The governors of Connecticut in the years following 1909 were: Frank B. Weeks, 1909–11; Simon E. Baldwin, 1911–5; Marcus H. Holcomb, 1915–21; Everett J. Lake, 1921–

CONRAD, JOSEPH (1856–), English novelist (*see* 6.968). Later work includes a study of the revolutionary temperament, *Under Western Eyes* (1911); an autobiographical set of *Reminiscences* (1912); three volumes of short stories, *'Twixt Land and Sea* (1912), *Within the Tides* (1915) and *The Shadow Line* (1917); as well as 4 novels, *Chance* (1914); *Victory* (1915); *The Arrow of Gold* (1919) and *The Rescue* (1920). A dramatized version of *Victory* was played at the Globe theatre, London, in 1920.

CONRAD VON HÖTZENDORF, COUNT (1852–), Austrian field-marshal, was born at Vienna, and after graduating at the military academy of Wiener Neustadt entered the army as lieutenant in a Jäger regiment. He was appointed to the general staff, and distinguished himself during the fighting in Bosnia and Herzegovina in 1878 and 1881. He continued to be employed mainly on the general staff, especially as lecturer on tactics in the Kriegsschule (the highest military academy), and he gained the reputation of an authoritative writer on military subjects. Among the many people in whom he inspired confidence was the heir to the throne, the Archduke Francis Ferdinand, by whose influence he was appointed in 1906 to succeed Count Beck as chief of the general staff. He displayed extraordinary activity, concerning himself not only with the work of his own office, but with matters of internal, and still more of foreign, policy. This brought him into increasingly sharp disaccord with the Foreign Minister, Count Achrenthal. Conrad was filled more particularly with the deepest distrust of Italy, and, convinced as he was that it would be impossible to avoid a struggle for the very existence of the Habsburg Monarchy, he wished to precipitate this struggle while the chances were not unfavourable. The latent opposition between the two men led to Conrad's temporary retirement in 1911. At the end of 1912 he was recalled to his post and in 1914 agreed to the military measures against Serbia which led to the World War. For more than two years of the war he was the real leader of the Austro-Hungarian armies. Though he was not always successful in the unequal struggle, the essential credit of the great success at Gorlice (1915) must be ascribed to him. To him also are due a series of successful operations, although a decisive victory was denied him. In 1917 he assumed the command of the forces operating in Tirol, and took part in every engagement until the battle of the Piave in the summer of 1918. After this he retired from

active service, was raised to the rank of count, created a field-marshal, decorated with numerous orders, and appointed commander of the Imperial Guard. Conrad was one of the most predominant personalities of the fallen monarchy, whose fate he was unable to avert. In his active military operations his most distinguished colleague was Gen. Metzger (b. 1870), who, after Conrad's retirement, took over a high command, distinguishing himself on the Italian front and finally in France in coöperation with the German armies. (A.—K.)

CONS, EMMA (1838–1912), English philanthropist, was born in London March 4 1838. As a young woman she studied art, but, owing to an acquaintance with Miss Octavia Hill, became interested in social work, and in particular in questions of housing. She became best known, however, for her work in connexion with Morley College and the Royal Victoria Hall, Waterloo Road, generally known as the "Old Vic." At one time a well-known theatre, it had degenerated into a disreputable haunt where nothing but the lowest melodramas were played. Miss Cons, whose social work in Lambeth had made her well acquainted with the difficulties of providing decent amusement at a cheap rate for the people of the neighbourhood, obtained an interest in the building about 1880. It was enlarged and improved, the sale of drink was forbidden, and miscellaneous programmes of music, drama, and lectures were embarked upon. In 1882 the wealthy manufacturer and philanthropist Samuel Morley began to take an interest in the affairs of the Hall, and in 1884 he joined the executive committee. He contributed a large amount of money to the scheme, and his unfailing sympathy and practical business advice were of the greatest value. His death in 1886 was a great blow to the work, but his name has been perpetuated in the foundation of the Morley College for working men and women, which developed from the lectures given at the "Old Vic." Its first vice-principal was Miss Caroline Martineau, a friend and co-worker of Miss Cons, and the institution now has over a thousand members. Miss Cons's work bore fruit after some years in the excellence of the entertainment provided and the high repute which the "Old Vic" attained. In 1880 concert performances of grand opera were started, and in 1896 a chorus was formed, thus making it possible adequately to present the operas. In 1905 symphony concerts were embarked on, and continued for several seasons. Miss Cons was elected to the first London County Council (1888), and was chosen an alderman, but retired owing to difficulties raised as to the right of women to sit. She died at Hever, Kent, July 24 1912.

Her sister, ELLEN CONS (1840–1920), was also closely associated with many philanthropic schemes, and was one of the governors of the "Old Vic." She died in London June 25 1920.

CONSERVATION POLICY.—The name "Conservation" has been given in the United States to the movement for using and safeguarding the natural resources of the country (or indeed any country) for the greatest good of the greatest number of the inhabitants for the longest time. It is a fundamental misconception to suppose that Conservation means nothing but the husbanding of resources. The first principle of Conservation is use, but it refuses to recognize needless waste and destruction as normal processes in the proper development and enjoyment of natural wealth. This conception of Conservation as a principle to be followed by the American Government was first brought into prominence by the Chief Forester of the United States during the Roosevelt administration, and was first applied to forest protection.

As with all nations that are both rich and young, a general indifference to the protection and preservation of its natural resources had marked the history of the United States. The rapid and reckless destruction of the forests was the first cause of a change in the attitude of the American people toward natural wealth. Effective action toward the protection and preservation of natural resources was not taken until long after the early warnings, which were heard nearly a century before the Conservation movement was born. In 1819, more than three score years before forestry had secured a foothold in America, a French naturalist, André François Michaux, in his work *The North America Sylva*, spoke thus of the destruction of forests in America:—

". . . neither the Federal Government nor the several states have reserved forests. An alarming destruction of the trees proper for building has been the consequence—an evil which is increasing and which will continue to increase with the increase of population. The effect is already very sensibly felt in the large cities, where the complaint is every year becoming more serious, not only of excessive dearness of fuel, but of the scarcity of timber. Even now inferior wood is frequently substituted for the White Oak; and the Live Oak, so highly esteemed in ship-building, will soon become extinct upon the islands of Georgia."

Conservation, as an American problem, received its first recognition in the work of the Inland Waterways Commission. On Oct. 3 1907 this commission suggested to President Roosevelt, who had created it, the calling of a conference of governors to consider the condition of the natural resources of the United States. The conference assembled May 13 1908 in the White House at Washington. Among those in attendance were the President, the Vice-President, 7 of the 9 members of the Cabinet, the 9 justices of the Supreme Court, the governors of practically all the states and territories (including Alaska, Hawaii, and Porto Rico), numerous members of the Senate and the House of Representatives, representatives of 68 national societies, more than 50 citizens selected for their special attainments, and the members of the Inland Waterways Commission. This was the first time the governors of the states met in conference, and the gathering was unique in American history. The conference, after deliberating for some days, adopted a declaration containing the following passage:—

"We agree that further action is advisable to ascertain the present condition of our natural resources, and to promote the conservation of the same: and to that end we recommend the appointment by each State of a commission on the natural resources to coöperate with each other and with similar commissions of the Federal Government."

In accordance with this recommendation, the governors of 42 states promptly appointed state conservation commissions, and less than a month after the conference had closed President Roosevelt appointed a National Conservation Commission, divided into four sections dealing respectively with waters, forests, lands and minerals. The commission was directed by the President to investigate and report to him regarding the condition of the natural resources, and to recommend to him measures for conserving them. As the commission had no funds at its disposal, the President directed the heads of departments at Washington to place their officers and facilities at the service of the commission. Thereupon the commission undertook, for the first time in the history of any nation, to prepare an inventory of the natural resources of the country.

The report of the commission was presented to the President in Jan. 1909, and was by him transmitted to Congress with a special message concurring in its statements and conclusions, and recommending it to the consideration of Congress and of the people generally. After making its report the commission continued its efforts in coöperation with governmental and extra-governmental agencies for the conservation of natural resources, in order both to extend its inventory and to determine what specific laws were needed for the wise and orderly development of the country's natural wealth. Unfortunately, this constructive work was stopped by the abolition of the commission through a law enacted by Congress later in the same year. Meantime President Roosevelt had invited the governor-general of Canada, the governor of Newfoundland and the President of Mexico to appoint commissioners to discuss, with commissioners representing the United States, the principles of conservation in their application to the continent of N. America. As a result of this movement, the first N. American Conservation Congress was held in Washington in 1909. President Roosevelt in Feb. 1909, after consulting the Queen of the Netherlands, invited the powers of the world to meet at The Hague for the purpose of considering the conservation of natural resources everywhere. Although a majority of the nations accepted this invitation, the project, after President Roosevelt's retirement from the presidency,

was allowed to die. During the administration of President Taft the struggle for conservation centred in the so-called Ballinger-Pinchot controversy, the cause of which was an effort on the part of Richard Achilles Ballinger, then Secretary of the Interior, to transfer to private ownership certain valuable coal lands in Alaska, and to throw open to private acquisition highly valuable water-power sites upon the public lands which had been set aside by President Roosevelt. The controversy resulted in the resignation of Mr. Ballinger, and had much to do with the defeat of President Taft in the election of 1912. The coal lands and water-power sites which formed the subject matter of the dispute remained in the public hands.

In the effort to secure the use of the natural resources so as to promote the greatest good to the greatest number for the longest time, President Roosevelt, in support of legislation by Congress to that end, withdrew from private entry 148,000,000 ac. of forest land, 80,000,000 ac. of coal land, 4,700,000 ac. of phosphate land, and 1,500,000 ac. containing water-power sites on the public lands. Thus during the Roosevelt administration more than 234,000,000 ac. of land were preserved, most of which will probably be permanent property of the nation.

Because of the abolition of the National Conservation Commission, the movement threatened to be seriously hampered by the lack of a central body in which could be conjoined for united and effective action the many persons and agencies devoted to the movement. Accordingly, the National Conservation Association, whose purpose was to inform and give effect to public sentiment, was established in 1909. In its successful efforts to prevent the passage of bad laws and to secure the enactment of good laws, this association became an effective factor in the passage by Congress of measures that carry out the Roosevelt policies of Conservation. The more important of these measures are: the Weeks law, to purchase lands for national forests in the White Mountains and the Appalachian Mountains where there was no public land; the Coal and Oil Leasing bills (for the continental United States, including Alaska) which are securing conservation by wise use, without waste and without monopoly, of valuable resources still in the public hands; and the Federal Water-Power Act, to provide for the development by private enterprise, under Federal ownership and control, of water-power in the public domain and navigable streams. Here again public property worth thousands of millions of dollars has been saved for the benefit of all the people of the United States. The association has been especially influential in defeating legislation that sought to destroy the national forests and to permit the diversion to private ownership of natural resources.

The Conservation movement is probably, among the many constructive policies inaugurated by President Roosevelt, that which will be most influential for good, and for which he will be longest remembered. (G. P.)

CONSTANS, JEAN ANTOINE ERNEST (1883–1913), French statesman (*see* 6.986), resigned from the embassy at Constantinople in May 1909. His success as a diplomat was less marked than as a minister. Presenting himself for the Senate (for Aveyron) in 1912 he was defeated. He died April 7 1913.

CONSTANTINE, King of the Hellenes (1868–), eldest son of George I. of Greece, was born Aug. 2 1868, and succeeded to the throne March 18 1913, on the assassination of his father. As the first prince of a Greek reigning dynasty born in modern times on Greek soil, and reared in the Greek Orthodox faith, he became from his birth to the Greek people the embodiment of their national aspirations, and was given the name of the last Emperor of Constantinople, in the superstitious hope that he would fulfil the old prophecy that the Empire of Byzantium would be restored to the Greek nation, when a king named Constantine and a queen named Sophia should reign on the Greek throne. This strange legend strengthened Constantine's popularity amongst the Greeks, and when in 1889 he married Sophia Dorothea of Hohenzollern, daughter of the Emperor Frederick of Germany, the coincidence of the name enhanced immensely the superstitious belief of the Greeks. He received his early education under private tutors at Athens. At the age of 18 he was sent to Berlin for a military education, and served in one of the Imperial Guard regiments, attending also a few desultory courses at the university of Leipzig. It was during his stay in Berlin that he made the acquaintance of his future wife, and (very much against his father's wishes) formed the attachment that was destined to exert such an important influence on his career.

After returning to Greece he was given various military commands. In 1897 he was sent to Larissa to take command of the Greek army in Thessaly, just before the outbreak of the disastrous war with Turkey. At the close of the war the Crown Prince was probably the best-hated man in Greece. The popular voice attributed the disasters to him and to his father. He still retained, however, his nominal post of commander-in-chief.

It was only in Aug. 1909, when the garrison of Athens suddenly revolted and demanded sweeping reforms, including the reorganization of the army and navy and the removal of the princes from all military commands, that Constantine and his brothers, George, Nicholas and Andrew, hastened to resign their commissions and to go abroad to escape the open hostility of public opinion. From this practical exile the Crown Prince first, and his brothers Nicholas and Andrew afterwards, were recalled and reinstated in their commands by Venizelos, when the latter became the all-powerful head of the Greek Government. His bill for the reappointment of Crown Prince Constantine as commander-in-chief of the army was bitterly opposed in the Greek Chamber by Theotokis, Gounaris, Rallis and other politicians, who a few years later were to become King Constantine's chief supporters. The army officers, too, with few exceptions, were much opposed to the bill. By a curious irony, it was only Venizelos' determined attitude that saved it from rejection. The Greek successes in the Balkan wars subsequently enhanced the Crown Prince's credit, and it was in an atmosphere of renewed popu'arity (Venizelos himself helping to exploit it) that he succeeded unexpectedly to the throne on his father's assassination.

King Constantine at once showed his monarchical spirit. He took to copying the modes of speech and action of his brother-in-law, the German Emperor. He began to speak, in his official utterances, of "My army" and "My navy"; to attend in person the swearing-in of the annual recruits and to impress upon them the extreme sanctity of their oath of allegiance to *him*. Officers were made to feel that their only hope of advancement lay in their devotion to the War-lord. And when his youngest daughter was born in 1913, he proclaimed "his" army and navy godfathers to the little princess. Such incidents attracted little serious attention at the time. But the subsequent course of events showed that the King was intent on converting the democratic, ultra-constitutional monarchy, which that of Greece had been, into one of a more absolute type on the Prussian model. Constantine and his defenders have indeed vehemently denied the existence of any secret understanding between himself and the Kaiser, either before or after the outbreak of the World War. Apart, however, from the indirect evidence furnished by the private telegrams exchanged between the royal couple of Greece and the Kaiser in 1916–7, which came to light after Constantine's dethronement, the existence of a definite understanding between William II. and Constantine to secure Greek neutrality in an impending European war has been expressly attested by Gen. Ludendorff himself in his war memoirs. During the first six months of the war Constantine gave no sign, even when Venizelos, before the first battle of the Marne, offered the alliance and aid of Greece to the Entente Powers. But when in Jan. 1915 the Entente promised Greece extensive territory in Asia Minor if she would join in the Dardanelles operations, and Venizelos proposed to coöperate, Constantine refused to give his sanction. Venizelos at once resigned, and at the ensuing parliamentary election a large Venizelist majority was returned (June 1915). The King was seriously ill at the time, and the Queen and the Government flatly refused to allow the appointment of a regent. Thus it was a full three months after the election before Venizelos

returned to power; during that interval every effort was vainly made by Court and Cabinet to seduce the Venizelist deputies into joining the "King's party," as it was now openly termed. When Venizelos finally was reinstated in office Bulgaria was preparing to fall upon Serbia in the flank, and Venizelos hastened to inform Bulgaria that any attack by her upon Serbia would cause the intervention of the Greek army. But Constantine, sending for the Bulgarian minister behind Venizelos' back, authorized him to inform his Government confidentially that Bulgaria need not fear any intervention on Greece's part. He gave the same assurance through the channel of the German Government. Thus Bulgaria proceeded unhesitatingly to order a general mobilization (Sept. 1915). To this step Venizelos at once replied by ordering a general mobilization of the Greek army. The King offered no objection to signing the decree, but when the next day Venizelos announced in the Greek Chamber that Greece would declare war against Bulgaria if she attacked Serbia, Constantine immediately sent for him and asked for his resignation, informing him that he would never consent to attack one of Germany's allies. To Venizelos' remonstrance that after the recent popular verdict the Crown was bound to follow the responsible Government's policy, Constantine replied that in questions of foreign policy he did not hold himself bound to follow the popular will, as he considered himself "personally responsible to God alone." Thus, after Venizelos' fresh resignation and the formation of a Zaimes Cabinet, the Greco-Serbian treaty was repudiated and Serbia was abandoned to her fate. As the Venizelist parliamentary majority refused to support the new Government a fresh dissolution was decreed, and in the new election (Dec. 1915), owing to the Venizelist party abstaining as a protest against the repeated unconstitutional proceedings of the Crown, a new Chamber was elected, composed entirely of Constantine's supporters. At Venizelos' invitation just before his resignation an Anglo-French force of over 100,000 men had been landed at Salonika, too late indeed to save Serbia but strong enough to entrench itself at Salonika.

Constantine and his party did not yet dare to commit themselves to a policy of open hostility to the Entente, although the Greek army, mobilized by Venizelos to defend Serbia, remained under arms in Macedonia until July 1916 to "defend Greek neutrality." But the Allied army in Macedonia was subjected to every sort of petty annoyance and even to espionage on the part of the Greek authorities; thus a Greek lieutenant, who was accused of tapping the Allied military telephone wires, was ostentatiously decorated by the King within the week. On May 26 1916, by direct order of Gen. Dousmanes, the King's chief-of-staff, over the head of the responsible Minister of War, Fort Rupel, which commanded the Struma Pass into east Macedonia, was surrendered to the Bulgarians by pre-arrangement between Constantine and the German general staff.

After Venizelos had seceded from Athens and established his "Provisional Government of National Defence" at Salonika, Constantine's movements became more and more openly hostile to the Entente. Regular communications with the Central Empires were kept up through north Epirus and Albania, and the German-Austrian submarines were suspected of receiving valuable assistance from royalist agents in Greece. Finally, Constantine's troops having become a standing menace to the Allied army in Macedonia, the Allies demanded the surrender of a quantity of arms and ammunition on the part of the Athens Government. The Lambros Ministry protested against this demand, but the King privately promised the French admiral, Dartige du Fournet, to surrender these arms if Athens were occupied by an Allied force to "save his face." When, however, on the following day (Dec. 1 1916) a body of 1,800 Allied bluejackets landed at the Piraeus and marched up to Athens, they were allowed to walk into positions carefully ambushed, and there were set upon by the royalist troops and thousands of reservists specially enrolled and armed for the purpose overnight. The Allied force drew off at nightfall with heavy losses. They would have been annihilated but for the presence at Phaleron of a powerful Allied fleet, which late in the day hurled a few shells into the royal palace and caused Constantine to order a cessation of hostilities.

This act of treachery on Constantine's part was followed the next day by wild scenes of hunting down as rebels and enemies of the King the unarmed Venizelist citizens of Athens. But the Powers took no immediate steps either to protect their friends or to avenge the insult to their own flags. After a whole month of deliberation, on Dec. 31, they declared a blockade of Greece and demanded the removal of the entire Greek army to the Peloponnesus. But no measures were taken against Constantine himself, since apparently there were still quarters within the Entente unwilling to believe the worst. It was only on the downfall of the Tsar (March 1917) that Great Britain and France finally arrived at a decision. On June 11 1917 a powerful Anglo-French fleet arrived at the Piraeus, carrying a land force of 30,000 men; and M. Jonnart, in the name of the Allies, demanded the immediate abdication of Constantine and his eldest son and their departure from Greece. Constantine saw that resistance was hopeless and bowed to the inevitable. Constantine (or "Tino," as he was commonly called) withdrew to Switzerland; there, with the aid of the German propaganda, he organized intrigues in Greece among the disaffected. He went so far in 1918 as to send his chief aide-de-camp to Germany to select two officers of the Greek army corps of Kavalla, then interned at Görlitz, to proceed to Greece on board a German submarine, to spy upon the Allied army in Macedonia and to organize an armed uprising in their rear. And he openly proclaimed *urbi et orbi* that he had never renounced his rights to the Greek throne and was still the only legitimate sovereign, his son Alexander (who had been proclaimed the new king) being merely his temporary *locum tenens*. Thus it came about that upon Alexander's untimely death and Venizelos' defeat at the polls in Nov. 1920, Constantine returned in triumph to Athens, in defiance of the Allies' non-recognition of him. He was not recognized in 1921 by any of the Allied Powers. On June 11 1921 (still without any formal recognition from the Allies) he left for Smyrna to take command of the Greek army in Asia Minor in the renewal of war (England and France standing aloof) against Turkey.

CONVOY (*see* 7.67*).—The system of convoy adopted by the British and American navies in 1917, by which merchant vessels sailed in organized groups under naval escort, played an important part in the World War. In the following account it should be noted that the term is used in the British Admiralty sense to signify not only the system but also the merchant ships under escort; in the U.S. navy the warships are the escort, the merchant ships the "train," and the whole is the convoy.

At the beginning of the war the British system of commerce protection was based on cruiser squadrons stationed at the focal points of trade and in important areas to deal with enemy cruisers and raiders. Though it proved sufficient to accomplish the destruction of the "Kaiser Wilhelm der Grosse" and the "Cap Trafalgar," the principal cruiser raiders escaped its clutches; for the "Emden" was sunk by the "Sydney" escorting a convoy at the time, the "Karlsruhe" was blown up by an internal explosion and the "Dresden" was sunk by a squadron detached for that purpose. From the first the system had been dislocated in every sea by demands for convoy, but by March 1915 the cruisers had been run to earth, and though raiders such as the "Moewe" and the "Wolf" reappeared, it was only occasionally and one at a time. The system of convoy was used in the case of the first large contingents of Australian and Canadian troops. The "Sydney" with the "Melbourne" and the Japanese cruiser "Ibuki," was escorting the Australian convoy across the Indian Ocean when she was detached to run the "Emden" down at Cocos I. on Nov. 9. The first Canadian contingent of 31,200 men which sailed from Quebec on Oct. 3 1914 in 31 transports was escorted by the cruisers "Charybdis," "Diana," "Eclipse" and "Talbot," reënforced, as they approached British shores, by the battle cruiser "Princess Royal" and the old battleship "Majestic." The system was

****These figures indicate the volume and page number of the previous article.***

resumed in the Atlantic in 1916 when the "Moewe" was out, and in the course of that year some 15 convoys of two to three transports each sailed from Halifax. But these were special escorts intended to protect their convoys from surface craft. The adoption of a general convoy system was still outside the pale of contemporary naval thought. A considerable proportion of the troop service across Channel was escorted; but this was a local service arranged by the admirals at Dover (for Folkestone to Boulogne) or Portsmouth (for Southampton to Havre). There was a tendency to regard the loss of merchant ships with little concern during that period, and a number of large ships were even fitted out at great expense to act as dummy battleships to be torpedoed by the enemy instead of the vessels they tried to counterfeit. The idea of using destroyers to escort the ordinary trade would have received short shrift at the Admiralty and in the Grand Fleet, nor was it necessary at the time.

In March and April 1917, when the British losses in merchant shipping assumed alarming proportions, the idea of a convoy system came again to the front. Previous ocean convoys had been directed against the surface raider; it was the submarine that now formed the principal menace. The system was in use in the case of what was called the French coal trade, a cross-Channel traffic from Portsmouth and Falmouth performed by small ships, where it had worked very successfully, and it was now suggested to extend it to the ocean routes. The system of protection in vogue at the time may be called the patrolled route system. There were three main approach routes to the British Isles, one N. of Ireland for ships making the Clyde or Liverpool by the North Channel (Route C); one S. of Ireland for ships making the Bristol Channel and Liverpool by St. George's Channel (Route B); one towards the Scillies for ships making the English Channel (Route A). These were called the Tory I., Fastnet (S.W. point of Ireland) and Scillies approaches, from the lights sighted by the ships as they made the coast. These approaches may be regarded as three great triangles gradually narrowing to three apexes at or near the points mentioned. They were patrolled with trawlers and a sprinkling of destroyers, and when any area was threatened by submarine activity the routes in it were changed.

In March 1917, the system was slightly modified. Half a dozen different routes were specified in each approach triangle, and it was proposed to switch the traffic from one route to the other every five days. As the routes in each triangle could lie some 150 m. apart in long. 15° W., there was considerable scope for dispersion, and the system was in effect a system of protection by means of dispersion and routeing. The patrols were a mere pretence, for the routes were on an average some 240 m. long, and to patrol them in strength with two destroyers and 16 trawlers was impracticable. The scheme was in its essence an endeavour to circumvent the submarine by routeing and it failed. Its advocates could not possibly maintain that it was as efficient as an escort system, for all important ships were actually escorted, and it must be regarded merely as an attempt to burke the significance of the fact that was beginning to assert itself, that every ship had to be escorted.

The idea of general convoy met with strong opposition from every side—at the Admiralty, in the Grand Fleet and amongst the masters and owners of ships. The Admiralty saw that it would involve the creation of a new organization; the Grand Fleet saw its destroyers being taken away; very few recognized the fact that the battlefleets were now becoming merely complementary factors in a *guerre de course*. The policy of the fleet being ready at any moment to rush out and join battle still held sway. It was a policy resting chiefly on the basis of intelligence supplied by wireless directionals, which made it possible to know when the German fleet was at sea. It meant that the fleet had to be ready at any moment to put to sea in battle array, and in these circumstances the commander-in-chief clung tenaciously to every one of his destroyers. These may be called the strategical objections to convoy, but other strong arguments could be urged against it. Ships would incur delay in assembling, instead of sailing direct; fast ships would incur further delay by having to reduce their speed to that of the convoy. Convoy meant congestion of ports on departure and arrival, and congestion of labour due to the simultaneous arrival of a number of ships. These objections were as old as the days of Duguay Trouin and Jean Bart, but there were other objections of a more modern type. The masters would never be able to keep station, and were at first much in favour of independent sailings.

On the other hand strong arguments could be marshalled in favour of convoy. Why string out 15 armed trawlers 10 m. apart to supply feeble protection on a line 150 m. long, when four destroyers attached to a convoy could give it continual and efficient protection over double the distance? It might appear at first that a convoy gave the submarine a massed target, but the danger of approaching it was greater, and submarine commanders preferred to attack unescorted ships. The real obstacle in the way of a convoy system was the difficulty of finding the destroyers required for the escort. More than half the modern destroyers were absorbed by the Grand Fleet and the Harwich flotillas. In Feb. 1917 10 were detached from the Grand Fleet to Devonport to assist in escorting important ships, and the use of armed trawlers was extended, but the latter were too slow and too ill-armed to be of much value.

The weekly returns issued by the trade division at this time conveyed a misleading idea of the situation. They gave the number of arrivals and departure of all nationalities, with the number of British ships of over 1,600 tons lost. The first set of figures had little to do with the real issue, for a small Dutch coaster making three voyages a week to France would figure six times in the arrivals and departures, which ran into several thousands, whereas the number of big ships arriving and leaving daily was very much less. The situation was much worse than it appeared, and the idea of general convoy gained ground.

In April 1917 the British had 3,534 ships over 1,600 tons, of which 1,125 were required for naval and military purposes, leaving only 2,409 available for civil purposes. There were not more than 15 patrols in each area of approach, and in March and April 1917 the number of ships passing through them was about 300, of which 24 were sunk, at which rate, giving each ship a round voyage of two months, practically one-half would have been sunk by the end of the year. Again those who argued in favour of the patrolled route system were arguing in direct opposition to their own policy, for escorts were always provided for all valuable munition ships and ships of national importance carrying Government cargo (some three or four a day in 1917). The patrolled route system was thereby acknowledged to be an inferior sort of makeshift for ships that were not of national importance. But in April 1917 it began to be seen that every ship was of national importance, and that a loss of 373 ships a month meant that the navy would lose the war before the army could win it. The great advantage of the patrolled route system was that it gave much less trouble and required very few ships, but the same virtues were inherent in no system at all.

One other argument was marshalled against the system, namely, that it would be better to use destroyers directly against submarines. The reply was that no likelier spot could be chosen for seeking them than in the vicinity of a convoy, and from the date convoys commenced to run in May 1917 to the end of the war some 15% of submarines sunk were actually sunk in the vicinity of or when attacking convoys. The losses of April brought the question to an acute stage. The centralization of the control of shipping in the Ministry of Shipping facilitated the inauguration of a general system of convoy. On April 26 the director of the anti-submarine division urged its introduction, and on May 17 1917 a convoy committee was appointed to arrange the details of a specific scheme. The volume of trade in the Atlantic daily at that time amounted to about 400 vessels, of which 300 were British and 87 neutral. As the area of convoy only extended to about long. 20° W., only some 30 vessels had to be convoyed daily, and it was decided to start with a convoy from the United States and Canada every three days, from Gibraltar every four and from Dakar every five days. The initiation of the system fell largely to Comm. Reginald G.

Henderson, R.N., and its organization and business management to Paymaster-Capt. H. W. Manisty. The first homeward-bound Atlantic convoy started on May 24, and by June 1917 convoys were being regularly run.

The system may be considered under two heads: (1) the organization at the ports of assembly and at the Admiralty, (2) the system of command at sea and the tactical measures of the convoy and escort. At the ports of assembly, escorts had to be provided to conduct ships from the ports of loading and to the ports of discharge. The convoy had to be assembled, the masters mustered and given their instructions, and the convoy handed over to the commodore. This work was done by port convoy officers, who were appointed at home to Lamlash, Devonport, Falmouth and Milford Haven and abroad to Sydney (N.S.), New York, Halifax, Gibraltar and Dakar. At all ports of any size, there were shipping intelligence officers who were now merged in the system and issued route instructions to the masters. At the British Admiralty the two principal tasks were assembly and routeing. The general management of the system lay with the organizing manager of convoys (Paymaster-Capt. H. W. Manisty), who worked in close coördination with the shipping controller. In the task of routeing he was assisted by naval officers and by a large convoy chart which showed continuously the latest movements of submarines and convoys. This chart was of the greatest value, for it made it possible to alter at once the course of a convoy if a submarine was reported in its vicinity, a system much more elastic and more exact than altering the routes blindly every five days. The three principal ports of assembly were Lamlash or Buncrana (Lough Swilly) in the N., Queenstown, Milford Haven and Falmouth in the S. Escorts were provided by the admirals commanding these areas, and orders for convoy were passed to them. An escort generally consisted of six to eight destroyers for a convoy of about 25 ships. A large portion of the work at Queenstown was gradually taken over by the U.S. navy, who worked in the closest harmony with Vice-Adml. Sir Lewis Bailey, the local commander-in-chief. The whole question hinged on the provision of destroyers. In Feb. 1917 there were only 14 destroyers at Devonport and 12 sloops at Queenstown available for convoy, and it was estimated that 81 destroyers or sloops would be required to provide escort for homeward-bound convoys, and 44 additional destroyers or sloops for outward-bound convoys. It was here that the aftermath of Jutland was severely felt. For the Grand Fleet still had to be prepared to meet the German fleet again, and insisted on a minimum margin of destroyers to enable it to do so.

The destroyer position in 1917 is shown in the table (A = modern new destroyers and flotilla leaders; B = old destroyers).

Destroyer State, 1917.

Summary:—

	Jan.	June	Nov.
Grand Fleet and Harwich	172	142	151
Dover, Nore, Portsmouth	70	81	71
Convoys	29	113	139

It was not sufficiently appreciated that the adoption by the Germans of the strategy of the *guerre de course* would mean their abandonment of fleet operations on a large scale, and that the protection of Allied merchant shipping was now just as important as the defeat of the enemy's fleet. The command of the convoy at sea was vested in a "commodore of convoys," usually a captain or commander R.N. or R.N.R., who hoisted his broad pennant in the largest ship of the convoy and was attended by a small staff of signalmen. He took general charge of the convoy until it met the escort, when the commodore then took his instructions from the senior officer of the escorts. A considerable equipment had to be provided for each convoy, including fog buoys, masthead angle tables, station-keeping instruments, and signalling lanterns. A convoy usually consisted of 25 to 32 ships. They were organized in five or six columns with ships 500 yd. and columns 800 yd. apart. The proportion at a later date was eight destroyers to a convoy of 22 ships and six to a convoy of less than 16.

The convoy came across by itself and was met by the escort on approaching the submarine zone, some 300 m. out at sea, and brought in by it. In daylight or in suspected areas or on a submarine report the whole convoy zigzagged, an operation which consisted in an alteration of one or two points (11° to 22°) on each side of the navigator's course (course of advance) for some 10 minutes. These alterations of course were intended to make it more difficult for the enemy to estimate the exact course of the ship, a necessary factor in adjusting the sights for firing a torpedo. Another protective element was the system of camouflaging ships, which rendered it more difficult to distinguish the fore and aft line of a vessel, a necessary preliminary in estimating its course (*see* CAMOUFLAGE: *Naval*).

The first convoys in May 1917 were all homeward-bound to Great Britain, but by Aug. outward-bound convoys were running too. The main designation of convoys was into H. and O. (homeward and outward), with subsidiary letters indicating the port of departure and a series number for each convoy.

The principal convoys were as follows:—

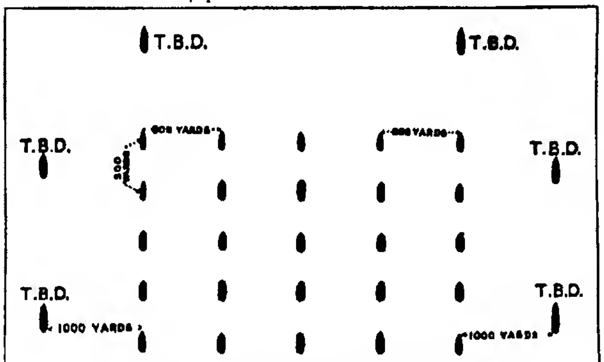
Homeward (H.)		Outward (O.)	
H.H.	Hampton Roads	O.B.	Buncrana
H.N.	New York	O.M.	Milford Haven
H.B.	" to Brest	O.Q.	Queenstown
H.X.	" to Liverpool	O.F.	Falmouth
H.S.	Sydney (N.S.) and Halifax	O.D.	Devonport
H.E.	Port Said (Eastern)	O.L.	Liverpool
H.G.	Gibraltar		
H.J.D.	Rio de Janeiro, Dakar		

By the end of Oct. 1917, 99 homeward convoys had come in comprising 1,502 steamers with a loss of 10 vessels sunk in convoy and 14 after dispersion, giving a total loss of 24 or 1·57 per cent. By the end of Nov., 77 outward convoys had gone out, with a loss of 0·57 per cent.

The time lost by fast ships remained a distinct disadvantage of the convoy system. In a voyage of 3,200 m. the time lost in waiting at ports of assembly (24 hours) and through slow travelling (133 hours) amounted to 157 hours or six and a half days, for a steamer of 5,000 tons. This was eventually diminished by the institution of fast and slow convoys, but on the other hand there were certain advantages which tended to compensate for the delay. Ships did not have to call anywhere for orders, and they were not affected by suspension of traffic, which often held up independent sailings.

The introduction of the convoy system had the effect of forcing the German submarines to attack nearer the shore. In

the early months of the year the crosses indicating ships sunk had been scattered all over the seas W. and S.W. of Ireland. They were now confined to coastal areas, which greatly facilitated the work of rescue and salvage. From Sept. to Dec. 1917, only six ships were lost over 50 m. from land, which meant a great reduction in casualties, with corresponding increase of confidence in convoyed ships. The homeward-bound convoys were also given what were called ocean escorts of armoured cruisers or armed merchantmen, who accompanied them the whole way. By Sept. 1917, Atlantic convoys were in regular operation with about 150 vessels coming in and the same number going out weekly. The destroyers which took the outward-bound convoy out, met the homeward-bound convoy and brought it in, though this procedure often led to delays and difficulties in bad weather, darkness and fog. The bulk of the Atlantic work in European waters was done by British craft, Great Britain providing 70% of the destroyers for convoy and the United States 27 per cent.



Convoy of 25 Ships with 6 Destroyers Escort

On the E. coast of Great Britain, matters followed a rather different course. A conference had been held at Longhope (Scapa Flow, Orkneys) on April 4 1917, under the vice-adml. of the Orkneys and Shetland (Sir Frederick Brock), and it had been decided to convoy Scandinavian ships, on whom Great Britain was dependent for much of its imported wood pulp. They came up from Hull to Lerwick, where an escort of two destroyers and four to six trawlers took them across. This route was much more exposed to attack by surface craft than the Atlantic route, for it was only some 350 m. from Horns Reef, a distance which could easily be covered by a fast cruiser in 15 hours of darkness. Such attacks were the natural counterstroke to a convoy system, and it was one of the principal functions of the fleet to screen convoys from them. The first attack of this sort took place on Oct. 17 1917, when the "Brummer" and "Bremse," two fast German cruisers, originally designed as minelayers for the Russian navy, attacked a Scandinavian convoy of 12 ships, and sank the two destroyer escorts, the "Mary Rose" and "Strongbow," and all but three of the convoy. A considerable force of light cruisers (comprising some 16 vessels) was in the vicinity, but as it was not close to the convoy, and the wireless installation of the escorts was destroyed by the first salvo, the enemy got away.

This was a severe blow to the E. coast convoy system and as a remedy it was proposed to provide a stronger covering force from the Grand Fleet. This entailed the reduction of convoys to three a week, the use of the Tyne instead of Humber as an assembly port, and the provision of nine modern destroyers. The commander-in-chief of the Grand Fleet demurred at the provision of destroyers, and at a conference on Dec. 10 1917 it was decided to use Methil, a small port on the Fifeshire coast of the Firth of Forth, as an assembly port. The decision had hardly been reached when two days later, on Dec. 12, the convoys were again attacked. The German attack was made on this occasion by two half torpedo flotillas (five boats each). The third half flotilla went N., and meeting heavy weather made Udsire on the Norwegian coast at 7 A.M. on the 13th. Steaming down the coast, the flotilla sighted at 12:30 P.M. a convoy of six steamers from Lerwick to Norway, escorted by the destroyers "Pellew" and "Partridge" and four armed trawlers. The "Partridge" received a shot in her main steam pipe, and after hitting a German destroyer, V100, with a torpedo which did not explode, was sunk. The "Pellew" escaped. The convoy was sunk, and the half flotilla returned home round the Skaw. Two armoured cruisers, the "Shannon" and "Minotaur," were acting as a covering force, but were again too far off, and though they hurried to the spot on receipt of a wireless message arrived too late. Here can be seen a distinct divergence of opinion and method between the conduct of the Atlantic and Scandinavian convoys. An escort against surface craft should be at least within sight of a convoy, and a covering force against an attack in force is of little use if it is not within reënforcing distance. At the root of the insufficient protection accorded to the Scandinavian convoys was the policy prevailing both at Whitehall and at sea that the Grand Fleet must be ready at any moment to sail for the Bight and bring the enemy to action. This naturally led to convoy work being regarded as an entirely subsidiary task. In April 1918, the German admiral Scheer made a bold sortie in force against the convoy. The whole fleet put to sea on April 23 for the Norwegian coast. In front was Adml. von Hipper with the battle cruisers of the first scouting division, and Scheer followed with the battlefleet. The time was ill-chosen. One convoy of 34 ships was just entering the Forth and another of 47 ships leaving it, while the British 2nd Battle Cruiser Squadron and 7th Light Cruiser Squadron were at sea covering them. This was not the only misfortune for the Germans. The "Moltke" at 8 A.M., about 40 m. S.W. of Stavanger, met with a serious accident and had to be towed home, being torpedoed by E42 on her way back. This was the last sortie of the German fleet, and it is interesting to note that it was directed against the convoy system. It led on the British side to the convoy route being shifted to the northward, so as to remove it farther from the source of attack and increase the chance of striking a counter-blow.

The possibility of an attack by surface raiders in the Atlantic had not been lost sight of. The commander-in-chief of the Grand Fleet was kept informed of the approximate position of convoys so as to be in a position to appreciate the situation at once if a raider got out. In Dec. 1917 the two armoured cruisers H.M.S. "Leviathan" and "King Alfred" were attached to convoys, and in 1918 a U.S. pre-dreadnought battleship was added. The possibility of an attack by battle cruisers was met by a U.S. dreadnought force being stationed at Bere Haven in Sept. 1918 to be available to meet convoys coming in, and in Oct. 1918 it actually put to sea for this purpose. Convoy was gradually extended to other routes, and by the end of the war the grand total of ships convoyed reached 88,000, with a loss of 436 ships or approximately 0·5 per cent.

The Mediterranean had always been a difficult area, and the institution of convoys in that sea followed a somewhat different course. Operations in that sea were greatly influenced by the fact that the Mediterranean outside the Adriatic was under French naval control, and the French commander-in-chief, Vice-Adml. Gauchet, would have assumed command in the event of the Austrian fleet breaking out. However, with the consent of the French and Italian naval authorities, a British commander-in-chief, Vice-Adml. Sir Somerset Gough-Calthorpe, was appointed in Aug. 1917 with the special charge of arrangements for the protection of trade and anti-submarine operations. The divided control, and the different patrol areas under different nationalities, did not make for efficiency, but the general arrangements were settled by a conference of Allied officers at Malta (*Commission de Malte*), with delegates from France, Italy and Japan. In the Mediterranean, as at home, the question hinged on destroyers. The Italians preferred to retain their destroyer forces in the Adriatic and on their own coastal routes, just as the British commander-in-chief wanted to retain them with the Grand Fleet. Of the British destroyers available (about 36), some eight were required to watch the Dardanelles

and the Aegean, and operations on the Syrian coast engaged the services of a few more. The Japanese coöperated heartily; their 14 destroyers did yeoman service, and during 1918 the system was entirely dependent on them for the escort of troop transports. The general allocation of British escorting craft in that area in Oct. 1917 was as follows:—

	Destroyers	Sloops	Armed Trawlers	Yachts	Gunboat
Aegean	8	6	6	—	—
Malta	6	11	35	1	1
Egypt	—	11	28	1	—
Gibraltar	2	5	—	3	—

It will be seen that sloops played an important part in the convoy system in the Mediterranean, and as they could not make the voyage from Gibraltar to Port Said without refuelling, it was necessary to provide complete reliefs for the escorts of O.E. and H.E. convoys as they passed Malta. This involved a severe strain on the convoy system, though it was eased later by the addition of some patrol gunboats.

The control of the escorts was at first under a British admiral of patrols, with patrol commanders acting for him at the various ports, who arranged for the formation of convoys and issued route instructions and sailing orders. The principal convoys were the Bizerta-Alexandria (British), Bizerta to Malta (British), Marseilles to Bizerta (French), Marseilles to Algiers (French), Milo (Aegean) to Alexandria (Br. and Fr.), with fast through convoys between the United Kingdom and Port Said under British escort. The system of patrols was retained by the French for a time on the Algerian coast, and the losses there were heavy. The defects which had existed at British home ports exhibited themselves abroad. The staff work was defective; intelligence was not freely and quickly distributed, and action was not taken on it. This led on March 20 1918 to a convoy running right into an area N. of Alexandria where warning had been given of the presence of a submarine waiting for it, with the result that four ships of the convoy were lost.

The Mediterranean remained one of the worst areas for losses. For instance, in Nov. 1917 out of 41 British ships lost, 14 had gone down in the Channel and 11 in the Mediterranean. The losses in the Channel had been stopped by the Dover barrage and Rear-Adml. Roger Keyes; and the First Lord (Sir Eric Geddes) and the Director of Naval Intelligence now proceeded in person to the Mediterranean to consult with the commander-in-chief there and make arrangements for a complete reorganization of his staff. The admiral of patrols was abolished, and a director of shipping movements instituted. Wireless directional stations were established at suitable points, and the losses were reduced to a reasonable figure. In Nov. 1917, 381 sailed in convoy in the Mediterranean, with a loss of nine or 2·35 per cent. In Sept. 1918, 979 ships sailed in convoy with a loss of eight or 0·82 per cent.

Troop movements were one of the most important branches of the convoy system, and it is interesting in this connexion to note the total numbers moved by sea during the war, which amounted to 22,114,000 from Aug. 9 1914 to Sept. 28 1918, made up as follows:—

Troops moved by sea, Aug. 1914 to Oct. 1918.

Cross Channel to France	15,576,107
From U.K. to Medit., India, Persian Gulf, Russia	938,562
From North America	1,334,173
From Australia	391,043
In Mediterranean, less 560,000 included above	1,363,976
Between India and Egypt	1,500,204
Various	1,010,694
	22,114,759

In the English Channel most of the work in 1917 was being done by small fast packet-boats, of which there were 16 on the Southampton–Havre route and eight on the Folkestone to Boulogne. During 1915 the average daily number of transports from Southampton was three to four, and the daily average requiring escorts was five to six in 1918. Of loaded troop and ambulance transports only two were sunk, the "Donegal" on April 17 1917, from Southampton to Havre, with 600 troops and 38 casualties, and the ambulance transport "Warilda" on Aug. 3 1918, from Havre to Southampton, with 125 casualties. The Folkestone to Boulogne route was controlled by the vice-admiral at Dover. Here the principal danger was mines. Vessels crossed only in daylight, and from two hours after to three hours before high-water. The average daily number of transports in the latter part of 1917 and 1918 was some half-dozen in each direction. In the last five months of the war the average daily troop traffic in the Channel was 11,254, viz. 5,500 at Southampton, 3,700 at Folkestone and 2,500 at Dover. The number of troops moved by fast steam-packet vessels in the Channel was enormous, and cannot have been much less than 12 millions, with casualties of less than 1,000. At Dover in the latter part of 1917 three to four destroyers and three to four P. boats were usually employed in cross-Channel escort work.

On the Atlantic route fast troop convoys came into use in April 1918, and during 1918 (up to Nov.) 1,037,000 men came over in them. Three large transports, the "Olympic" (23 knots), "Mauretania" (25 knots), and "Aquitania" (24 knots), also worked singly and independently, with escorts of three or four destroyers to bring them in and take them out. The "Olympic" was attacked on several occasions, but never successfully, and in May 1918 it rammed and sank a submarine (U103). Only three transports were lost on the Atlantic route, the "Tuscania" with 2,400 U.S. troops, torpedoed and sunk seven m. N. of Rathlin Is. on May 2 1918 with a loss of 211 troops, the armed merchant steamer "Moldavia," escorting HC1 and carrying troops, torpedoed and sunk in the English Channel on May 23 1918 with a loss of 64 troops, and the "Otranto," escort to HX50, wrecked on the coast of Islay after collision on Oct. 6 1918, with a loss of 362 troops. The total loss of troops was 537. The losses in the Mediterranean were much heavier, and three-fourths of the troopships sunk went down there though only 10% of troop movements took place in that sea. Submarines worked there under specially favourable circumstances, while the narrow waters gave little opportunity of altering the routes to any great extent. In 1915 some 330,000 troops were conveyed in 242 transports, all of which arrived safely except three—the "Royal Edward," torpedoed and sunk on 13/8/15 in the Aegean with a loss of 865 troops, the "Ramazan" in the Aegean on 19/9/15 with a loss of 11 troops, the "Marquette" approaching Salonika on 23/10/15 with a loss of 128 troops. In 1916, 220,000 troops were conveyed in 143 transports, all of which arrived safely.

During 1917 and 1918 the troop movements were principally to Salonika, Egypt and Syria, and 14 transports were lost as follows:—

		Losses.
1917:	"Ivernia," Marseilles to Egypt, 1/1/17, off C. Matapan	120
	"Georgian," Alex. to Salonika, 8/3/17, off C. Sidero	53
	"Cameronian," Marseilles to Basra, 15/4/17, 150 m. E. of Malta	223
	"Arcadian," Sal. to Egypt, 15/4/17, off Milo.	279
	"Transylvanian," Mars. to Egypt, 4/5/17, Gulf of Genoa.	434
	"Cameronian," (French service), 2/6/17, off Alexandria	63
	"Aragon," Mars. to Egypt, 30/12/17, off Alexandria	426
	"Osmanieh," Taranto to Alex., 31/12/17, off Alexandria	225
1918:	"Kingstonian," Alex. to Mars., 11/4/18	9
	"Omrah," 12/5/18, off C. Spartivento	1
	"Leasowe Castle," 26/5/18, 104 m. from Alexandria	99
	"Missir," 29/5/18, 80 m. from Alexandria	44
	"Hyperia," 28/7/18, 84 m. from Port Said	52
	"Anhui," 12/8/18, off Cyprus	4

There was thus a total loss in the Mediterranean of 17 transports and some 3,036 troops. It will be seen that the total loss of transports was about 20, with a loss of some 4,563 troops, or about one in 5,000, of which 60% occurred in the Mediterranean.

The number of vessels which sailed in British convoy from July 1917 to Oct. 1918 were:—

Outward		7,239
Homeward:	North Atlantic	5,529
	Gibraltar	1,705
	Dakar	564
	Sierra Leone	405
	Rio de Janeiro	307
	Medit., through	321
	Medit., local	10,464
	Scandinavian	10,487
	E. Coast	12,541
	French coal trade	37,562
	Dutch	902
		88,026

(A. C. D.)

CONWAY, SIR WILLIAM MARTIN (1856–), English traveller and man of letters (*see* 7.69), was elected Coalition Unionist M.P. for the minor (grouped) English universities in 1918. In 1917 he was made director-general of the projected Imperial War Museum, to the organization of which he devoted his energies, with the result of a large exhibition of the collections towards it being opened at the Crystal Palace in 1920. Amongst his later publications were *The Sport of Collecting* (1914), *The Crowd in Peace and War* (1915) and *Mountain Memories* (1920).

COOK, SIR EDWARD TYAS (1857–1919), English journalist and man of letters, was born at Brighton May 12 1857 and educated at Winchester and New College, Oxford. Whilst at Oxford he was president of the Union and of the Palmerston club and, on coming to London as secretary for the extension of university teaching, he became a contributor to the *Pall Mall Gazette*, then under the editorship of John Morley. He was later assistant editor under W. T. Stead and editor from 1890 till 1892, when the paper passed into the hands of Mr. W. W. (afterwards Lord) Astor and changed its politics. Cook then resigned, but a year later became first editor of the newly founded liberal evening paper, the *Westminster Gazette*. In 1896 he gave this up to take the editorship of the *Daily News*, which he held till 1901. During the World War, conjointly with Sir Frank Swettenham, he directed the official Press Bureau. He was knighted in 1912, and created K.B.E. in 1917 on the inauguration of the Order of the British Empire. He was a lover of art and of gardening. He published *Studies in Ruskin* (1891), edited the works of Ruskin (1903–7), and wrote the authoritative *Life of Ruskin* (1912), also producing handbooks to the National Gallery and the Tate Gallery, and to the Greek and Roman antiquities in the British Museum. His book on *The Rights and Wrongs of the Transvaal War* ran into several editions, and he wrote *Life of Florence Nightingale* (1913) and *Delane of the Times* (1915), as well as two volumes of *Literary Recollections* (1918 and 1919). He died at South Stoke, Goring, Sept. 30 1919.

COOK, SIR JOSEPH (1860–), Australian politician, was born at Silverdale, Staffs., and at the age of nine started life in a coal-mine. In 1885 he went to Australia and six years later entered the N.S.W. Legislature, holding office as Postmaster-General 1894–8 and Minister of Mines and Agriculture 1898–9. He was elected to the Commonwealth Parliament for Parramatta as a Free Trader in 1901 and became Minister for Defence under Mr. Deakin 1909–10. In 1913 he formed a Liberal Cabinet after the defeat of the Labour party; but just before the outbreak of the World War, the governor-general decided to appeal to the country and as a result of the elections Mr. Fisher assumed the premiership. Cook, before vacating office, had placed the Australian fleet units at the disposal of the British Admiralty. He did not take office again until 1917 when he was Minister for the Navy in Mr. Hughes's second Ministry. The following year he was created G.C.M.G., having in 1914 been sworn of the Privy Council.

COOLIDGE, CALVIN (1873–), American statesman, was born at Plymouth, Vt., July 4 1873. After graduating from Amherst in 1895 he studied law in an office at Northampton, Mass. Here he began to practise in 1897 and soon became prominent in local affairs. After serving as city clerk, city councillor, and city solicitor successively, he was elected in 1907 a member of the General Court, or House of Representatives, of Mass. He was mayor of Northampton, 1910–11, and sat in the state Senate from 1912 to 1915, being its president during his last year. He became lieutenant-governor of Massachusetts in 1916 and was re-elected in 1917 and 1918. He was elected governor of Massachusetts in 1919 and in 1920 was reëlected under circumstances that attracted nation-wide attention. He had dealt summarily with the striking policemen in Boston Sept. 1919, refusing to re-instate them. In the following gubernatorial campaign this was made an issue by his Democratic opponent, who appealed to those in sympathy with the strikers. The results vindicated the governor's action; he obtained a majority of 114,000 votes (out of a total of 510,000). Already in April 1919, during a strike of telephone operators in Boston, he had proposed that the state take over the lines, but the trouble was soon settled. That he was not opposed to labour was shown by his earlier support of the bill limiting the scope of injunctions against striking employees. In June 1919 he vetoed the bill for increasing the pay of members of the Mass. House, arguing that their service was optional and not a means of livelihood; it was public service and should not be made a job. As governor he recommended that Massachusetts ratify the woman-suffrage amendment to the Federal Constitution. In 1920 he vetoed a bill calling for censorship of moving pictures and likewise a bill to permit the sale of "2·75 per cent" beer. The latter he declared would be "hypocritical legislation" because, with a Federal law on the statute book forbidding beer with an alcoholic content of over one-half of 1%, it would still not be possible to sell 2·75% beer in Massachusetts. At the Republican National Convention in 1920 he received a few votes on all ten ballots for president. When the voting for vice-president began his victory was at once apparent and he was nominated by acclamation. He was elected in Nov. on the ticket with Warren G. Harding by an overwhelming vote.

Some of his speeches were published under the title *Have Faith in Massachusetts* (1919).

COOPER, SIR RICHARD POWELL, 1st Bart. (1847–1913), English agriculturist, was born Sept. 21 1847. He became a member of the firm of Cooper & Nephews, chemical manufacturers and exporters of pedigree live stock, and achieved a great reputation as a breeder of shorthorn cattle and Shropshire sheep. He rendered great service to the Argentine Republic by supplying it with British live stock. He died at Berkhampstead July 30 1913, being succeeded as 2nd Bart. by his son Richard (b. 1874), M.P. for Walsall from 1910.

COÖPERATION (*see* 7.82).—The term "coöperation" covered in 1921 a large number of forms of economic organization which had little resemblance except that of name. In considering their development since about 1907, it is necessary to deal with each type separately. Coöperative organizations may be conveniently classified under four main heads:—consumers' coöperation, industrial producers' coöperation, coöperative credit and banking, agricultural coöperation.

Consumers' Coöperation.—The British coöperative movement, though it contains producers' societies, is in fact almost synonymous with consumers' coöperation. Of 1,459 societies affiliated to the Coöperative Union in 1919, 1,357 were consumers' societies and 95 producers' societies; the membership of the consumers' societies was 4,131,477 and their trade over £314,000,000, while in the producers' societies the membership was 39,331 and the trade £7,000,000.

The growth of the movement between 1906 and 1920 was very remarkable. The membership of retail societies rose from 2,250,000 to over 4,000,000, their capital from £33,000,000 to nearly £80,000,000, and their sales from £63,000,000 to £198,000,000. The significance of these figures is not merely that this vast industrial system has been built up and managed by the working classes of the United Kingdom, but also that in 1921 between one-third and one-fourth of the population of the United Kingdom consumed commodities manufactured or distributed under this coöperative industrial system, a system which eliminates profit-making and implies democratic control of industry

by the community of consumers. And it was now no longer true to say that the movement flourished mainly in the industrial districts of the North and Midlands; London, for instance, which for long had the reputation of being a "coöperative desert," had become an active centre of coöperation, and the London Coöperative Society, recently formed by an amalgamation of two important societies, was in 1921 the largest coöperative society in the kingdom and had a membership of nearly 100,000 and annual sales of nearly £3,500,000.

But if the expansion of the distributive side of the movement in the local societies had been great, the growth of production and manufacture by consumers' societies was even more remarkable. Nearly all the retail consumers' societies are federated in the English, Scottish, and Irish wholesale societies for the purposes of manufacture and wholesale supply. The value of the goods supplied by these three wholesale societies to their members amounted in 1919 to over £115,000,000. The outstanding feature in the history of 1910–20 was the way in which the wholesale societies, particularly the English C.W.S., proved that the system of consumers' coöperation can be adapted to control the various branches of industrial production. The English C.W.S. is one of the most important and varied industrial businesses in the world. Its employees number about 40,000; in 1919, apart from its activities as a wholesale supplier and distributor, it produced or manufactured for its members commodities valued at over £25,000,000. It was in 1921 the largest flour miller in the United Kingdom and probably the largest timber importer at the Manchester docks. Its factories are to be found in every large industrial centre in England. It produces boots and shoes, textiles and clothing, furniture, metals and hardware, soap and candles, tobacco and groceries.

The most significant feature in the development of the productive activities of the consumers' societies is the way in which circumstances have compelled the C.W.S. to obtain control over the raw materials necessary for the production of the commodities consumed by coöperators. The supply of a staple article like bread will afford a good example of this tendency. The baking of bread has from the earliest times been a successful coöperative industry and large numbers of societies have their own bakeries. Coöperators, however, soon found that baking was only the last link in a whole chain of industries which determined the price and quality of bread. In order that the community of consumers might really exercise control over that price and quality, the movement was driven backwards from the baking industry to enter the milling industry. Though the C.W.S. has become the biggest miller in the kingdom, and the value of the products of the corn-milling industry of the movement was nearly £13,000,000 in 1919, events at the beginning of the World War taught coöperators the weakness of their position unless they also had some control over the production and supply of grain which was ground into flour in their mills. In the early days of the World War the movement stood out against "profiteering" in bread and flour, and there were several instances of societies which succeeded in keeping down the price of bread in their areas by refusing to enter into agreements with the other bakers to raise it. But coöperators had no such power of influencing the price of wheat upon which depended the price of flour, because they depended themselves upon the private wheat-grower for their supplies. These considerations induced the C.W.S. to acquire 10,000 ac. of wheat-growing land in Canada.

There are other equally remarkable examples of the same tendencies. In 1914 the C.W.S. had hardly touched agriculture; in 1921 it owned nearly 35,000 ac. of land in the United Kingdom, and in a single quarter of 1920 it started a cattle market at Gisburn, a butter factory at Carlisle, and a fish-curing depôt at Fleetwood. Again, it is only since the war that the English and Scottish wholesale societies have become really large owners of tea estates; during 1920 they purchased no less than 32,000 ac. of tea plantations in India and Ceylon. Lastly, the same process may be observed in the soap and candle industry, for in 1921 the C.W.S. at its depôts in West Africa purchased palm kernels direct from the natives, shipped them to its oil mills in Liverpool, which again supplied to its soap and candle factory at Irlam the materials of another industry.

Coöperative industry, based upon a democratic organization of consumers, spread in the decade 1910–20 from town to town and from industry to industry throughout the economic system of Great Britain, but perhaps one of its most interesting and important developments was in the sphere of international trade. In one sense the coöperative movement, as a large importer of food, raw materials, and manufactured goods, had always engaged in foreign trade, but as an importer there was nothing to distinguish its activities from those of the ordinary private trader or joint-stock company. But the C.W.S. has shown since the war what great possibilities there are in the movement for conducting international exchange of goods on a non-profit-making, coöperative basis. Coöperative international trade implies, of course, that there should be a direct exchange of goods between the organized coöperative movements of the several countries and that profit-making should be eliminated by the payment of dividend upon purchase. The machinery for such trade already exists, for no fewer than 19 European countries possess coöperative wholesale societies, and these wholesale societies can organize international trade with one another on a strictly coöperative basis.

To some extent this kind of trade had existed for many years; before the war, for instance, the English C.W.S. supplied tea to the German wholesale society and imported cheese from the Swiss wholesale society, while the German wholesale, again, supplied goods to the Danish wholesale. But the economic situation at the end of the war gave a great impetus to international coöperative trade. The ordinary machinery of foreign trade had broken down as the result of war and blockade, and it would not right itself, partly because of the chaos in credit and the exchanges, and partly because a great deal of the machinery was under governmental control. In such circumstances the coöperative movements of the various countries, resting on the broad basis of the organized consumers both in regard to trade and credit, and with their machinery of production and distribution intact, were not under the same disadvantages as capitalist enterprises.

The English C.W.S. took the lead in organizing international exchange, and it did so in three different ways. It supplied goods direct to the coöperative organizations of France, Holland, Switzerland, Norway, Australia, Canada, Egypt, India, South Africa, Palestine, Brazil, and China. Secondly, it gave credits amounting to nearly £1,000,000 to the Rumanian, Polish, and Belgian coöperative movements, the greater part of these credits being taken in the form of food and manufactured goods. Thirdly, it tried the experiment of direct barter with the coöperators of South Russia, sending a cargo of clothing, etc., to the Russians and receiving in exchange a cargo of raw materials. This experiment in coöperative barter was not very successful, partly owing to political difficulties, but the other enterprises led to an international movement among coöperators to develop coöperative foreign trade. In 1919 and 1920 there were conferences of the wholesale societies of the various countries, and a scheme was agreed upon under which each wholesale society would organize an export department, there would be joint purchasing arrangements between the various societies, and there would be a central bureau of statistics for the collection of information regarding goods which each wholesale society either demands or can supply.

Two other developments of the coöperative movement deserve notice. The first is insurance. The Cooperative Insurance Society, which is a joint insurance department of the English and Scottish wholesale societies, now undertakes life, fire, accident, and employers' liability insurance. In all these departments there has been a rapid development in recent years. The most interesting feature is the collective life assurance business, under which a coöperative society collectively insures the lives of all its members: under this system there is a great saving in cost, for there is no collection of premiums from individuals, the premiums being paid in a lump sum by the society and recovered from the dividend payable to members. In 1919 there were 817 societies assured in this way, and the number of members in these societies was 2¼ millions. This insurance business is conducted on strictly coöperative principles; thus out of the profits on fire insurance, after the usual rate of 5% on capital was paid, a dividend of 2s. in the £ to members and 1s. to non-members upon their fire insurance policies was declared in 1918. The progress of coöperative insurance may be seen in the fact that the income from life, fire, and accident premiums rose from £104,615 in 1909 to £924,066 in 1919, an increase of 783 per cent. The C.W.S. banking activities have made equal progress. The C.W.S. Bank has (1921) two branches, one in London and the other in Manchester. It accepts current accounts from coöperative societies, trade unions and friendly societies, clubs and other mutual organizations. In 1920 the number of current accounts with the bank was as follows: coöperative societies 1,016, trade unions and friendly societies 3,347, clubs, etc., 1,391. The deposits and withdrawals in the half year ending June 1920, amounted to £314,000,000, showing an increase of over 26% on the corresponding period of 1919. The C.W.S. banking is, again, conducted on a strictly non-profit-making, coöperative basis, the profits being returned to customers in the form of a dividend upon their balances.

The facts and figures given above show the tremendous growth of the coöperative movement. The increase in its membership and the great extension in the area of its operations have brought new problems and created new tendencies. Up to the end of the

19th century the movement was content to proceed on its way of steady development in a certain amount of obscurity. This is no longer the case: coöperators have begun to claim the place to which their numbers and operations entitle them in the economic life of their country. These claims can be stated shortly as follows: Consumers' coöperation is a system which ensures a democratic control of industry by the community organized as consumers. Every consumer can join a society and every member has one vote and can, if he cares to do so, exercise an equal power of control over the conduct of industry. The dividend on purchase ensures that commodities are supplied to consumers at cost price and that, therefore, profit is eliminated. Under coöperation production and the various spheres of industry from banking to insurance, from the production of raw materials to the distribution of manufactured articles across the counter of the shop or store, are all carried on for use and not for profit. This system has already shown that it can adapt itself to one economic sphere after another and there is no reason to suppose that the scope and range of coöperative industry are not capable of almost indefinite extension. The movement, with its 4 million members, already represents from 12 to 15 million consumers or more than one-quarter of the population, and consumers' coöperation is now, in fact, an alternative to the ordinary capitalist system of controlling industry.

These claims and ideals are being put forward and are undoubtedly having an effect upon the development of the movement. They are not held consciously by the vast mass of the 4 million members, but they are slowly penetrating the movement, largely owing to the educational work of the societies and the Coöperative Union and also of a very active and influential coöperative organization, the Women's Coöperative Guild, which has a membership of nearly 50,000 women members of coöperative societies.

The increase in coöperative activity and in the consciousness among coöperators of the importance and capacities of their movement are partly the effects of the war. It might have been expected that the dislocation in the economic life of the country and the difficulties of food supply would have had an adverse effect upon a working-class movement like the coöperative movement. The facts show that the reverse was the case. The membership of retail societies, for instance, rose from 3,054,000 in 1914 to 4,131,000 in 1919, an increase of 35%, while the increase from 1909 to 1914 was only 24%. This increased rate of growth was partly due to the rise in prices and the popular irritation against "profiteering," for the elimination of profit-making and the dividend on purchase tend to keep prices down in the coöperative store and make "profiteering" impossible.

Reference has also been made above to the way in which circumstances connected with the war led to an extension of the productive and distributive activities of the C.W.S. But the war had another effect upon British coöperators: rightly or wrongly there grew up in the movement a widespread conviction that it was being victimized in the interests of private traders. Definite complaints were made of unfair treatment of coöperative societies and their staffs by military service tribunals and of discrimination against coöperative organizations in the allocation of Government-controlled supplies. The decision of the British Government to tax coöperative societies by means of the Corporation Profits Tax brought the dissatisfaction of coöperators to a head. The argument was freely used that the movement, in order to protect itself against political action, must "enter politics." In 1917 the whole question was discussed at the Coöperative Congress, and a resolution was passed that the movement should enter politics and nominate candidates in constituencies as an independent unit, but that it might work with other organizations having similar aims and objects. Several coöperative candidates stood in the general election of 1918 and one was elected. The Coöperative party was still in its infancy in 1921 and any estimate of its future was impossible. One feature of the tendency which it represented must, however, be noted. There was a considerable body of feeling in the movement which held that the Coöperative party should unite with the Labour party and trades union movement to form a "Labour and Coöperative Political Alliance." On the other hand a large number of coöperators were not prepared to accept this proposal. The whole scheme for such an alliance was in 1921 still under discussion in the movement.

Another problem which has assumed great importance in recent years for coöperators is their relations to their employees. In 1919 the consumers' societies employed about 175,000 persons, of whom about four-sevenths were employed in distribution and three-sevenths in production; the wages and salaries paid to these employees amounted to about £20,000,000 a year. The relations between the movement and its employees have been complicated until recent years by a misunderstanding as to the nature of consumers' coöperation. Coöperators themselves did not distinguish clearly between the control of industry by the community organized as consumers for use and not for profit (consumers' coöperation) and the control of industry by the workers or producers in self-governing workshops or factories in which the profits were divided among the workers (producers' coöperation). Hence arose a certain school within the consumers' movement which held that the employees of consumers' societies should share in the "profits," although the dividend on purchase eliminates "profits" in the sense in which a joint stock company or a self-governing workshop makes a profit. The illogicality of this position was, however, gradually realized, and in 1921 very few societies paid the bonus on wages by which the coöperative employee was given a "share in profits."

The coöperative employee was therefore recognized to be merely a wage-earning employee of the democracy of consumers. But the movement, as a large employer of labour, was brought face to face with many new problems. As an employer it stood in a peculiar position. It was composed mainly of the manual wage-earning class, and a very large number of its members were naturally trade unionists. It always professed to pay good wages and to give the best possible conditions of employment. But it was competing with the businesses and factories of the ordinary capitalist type, and competition was so severe that coöperative trade and industry would soon be killed out if wages and conditions of employment within the movement were such as to raise the cost of production substantially above that of its rivals. Most people agree that on the whole the conditions of the coöperative employee compared very favourably with those of employees of private firms and companies, although there were still societies in which wages, etc., were bad. The movement had, however, increasing difficulties with organized labour.

Up to 1920 large numbers of coöperative employees were organized in a special trade union, the Amalgamated Union of Coöperative Employees (membership in 1920, 90,000). This union was founded in 1891, and it throws some light upon its original relations with the coöperative employer that in the original rules there was no provision for strikes. But this happy situation could not and did not continue. The presence of large numbers of trade unionists within the movement means that any demand for increased wages will probably receive some support within a society. There is no doubt that organized labour to some extent took advantage of this fact: a demand for increased wages or shorter hours was often first made upon coöperative societies, with the intention that, when the coöperators had given way, labour could then go to non-coöperative employers and demand that they should pay the same wages or give the same conditions as coöperators.

These facts and conditions gradually led to strained relations between the movement and its organized employees. As a whole the movement stood as strongly for trade union recognition and for the payment of trade union rates of wages as the trade unions themselves, indeed several societies insisted that their employees should be members of their unions. There had also been for long in existence joint machinery of the movement and the unions for settling industrial disputes by conciliation and arbitration; but for various reasons this machinery did not work satisfactorily, and in 1911 the Amalgamated Union of Coöperative Employees began a more militant policy and made provision for a strike

fund. Since that time there have been several strikes against coöperative societies. The whole question of the relation between the coöperative democracy and its employees has been raised by these events, and in 1921 it remained unsettled. It was complicated by the demand among certain sections of labour for workers' control of industry. Many coöperators believed that the workers should be given some share in control, *i.e.* that they should share with the consumer in the determination of rates of wages and conditions of employment. On the other hand it is obvious that the whole principle of consumers' coöperation, control of industry by the community of consumers for the use of the community, is inconsistent with the complete control either of individual factories and workshops or of whole industries by the organized workers, the principle of producers' coöperation, syndicalism, and guild socialism.

Foreign Countries.—The consumers' movements outside England owe their origin directly to the British movement, and all of them were many years behind it in development. But the history of their progress has been almost precisely similar to that of the British movement. In 1921 there was hardly a single European country without consumers' societies. Nearly all of these foreign movements showed a considerable increase in membership and trade during 1910–20; the war, both in belligerent and neutral countries, had a marked effect in increasing the number of cooperators and in extending the development and scope of coöperative industry. The following figures show the growth of some of the Continental movements after 1914:—

Country.	Total Membership		Total Turnover			
	1914	1919	1914.		1919	
Denmark	244,000	317,000	Kr	105,000,000	Kr.	150,000,000
France	880,000[1]	1,300,000	Frs.	321,800,000[1]	Frs.	1,000,000,000
Germany	1,717,519	2,308,407	Marks	492,080,510	Marks	1,075,581,269
Norway	31,000	80,000	Kr.	10,019,600	Kr.	71,215,200
Sweden	111,293	225,423	Kr.	30,466,473	Kr.	216,118,000
Switzerland	276,431	353,811	Frs	143,050,071	Frs.	289,666,378

[1] Estimated

Though the Continental movements were not so advanced, particularly on the productive side, as the British movement, there is evidence that most of them were firmly established in 1921 and were rapidly following the same path of successful development. The German movement, the largest and most successful on the Continent, had in fact reached the same stage as the British: its membership increased while the number of societies was stationary or decreased; it had a highly developed wholesale society, the *Grosseinkaufsgesellschaft Deutscher Konsumvereine*, whose productive activities included tobacco, soap, matches, textiles and clothing, and confectionery. The majority of the other Continental movements were still in that stage of structural consolidation which in England had been largely completed before 1900. Its most marked feature is federation or amalgamation of small, and often competing societies, so that an increase in the number of coöperators may be accompanied by a decrease in the number of societies. Examples may be found in the recent developments in Denmark and France. In Denmark, although agricultural cooperation had reached a very high state of development, consumers' coöperation in the towns only began about the beginning of this century. Its progress was slow until 1910. Then there was a rapid increase in the number of societies, members, and turnover; this was followed by a period of consolidation, in which there was extensive amalgamation among the Copenhagen societies while the membership and turnover continued to increase. This process, typical of the development of a consumers' movement, can be seen in the following statistics of Danish urban coöperative societies:—

Year.	Number of Societies.	Number of Members.	Turnover Kr.
1910	44	15,710	4,876,000
1914	92	39,698	14,378,000
1919	79	64,187	23,648,000

The same tendency is at work in France, where since 1914 has been seen the establishment of large district societies which absorbed the small local societies.

Another feature of foreign coöperation, which should be noted, is the development of wholesale societies. The development of a consumers' movement into a large industrial system depends upon the growth of a strong wholesale society which shall eventually be capable of undertaking a great variety of productive enterprises. It is significant that in 1919 no less than 19 European movements had wholesale societies. It is true that many of them were still in the stage of wholesale dealing for the supply of the local distributive societies, but the history of the British movement shows that this stage must precede any large development in manufacturing enterprise, and many foreign wholesale societies, *e.g.* the French, German, and Swiss, have greatly extended their productive activities.

Lastly, it should be remarked that in 1910–20 consumers' coöperation established itself in many countries outside Europe. For instance, up to very recent times consumers' coöperation could hardly be said to have existed in the United States, but latterly, partly owing to the educational work of the Coöperative League of America, a vigorous movement and some 2,000 societies had come into existence. Coöperation had also established itself and was making progress in Armenia, some of the British dominions, *e.g.* Canada, South Africa, and India.

Industrial Producers' Coöperation.—The typical example of producers' coöperation is the workers' society in which the workers own and manage the factory and divide the profits of the enterprise among themselves. But many distinct types of industrial organization are ordinarily included under the term producers' or workers' coöperation, types differing as widely from one another as the ordinary business or joint stock company which gives its employees a share in the profits, and the self-governing workshop. Here we shall deal only with producers' coöperation in the strict sense, *i.e.* societies or enterprises in which the instruments of production are owned and control exercised by the workers or producers.

There was little change in the position of producers' coöperation during 1910–20. There was no marked extension in the number of enterprises or in the sphere of their operations either in Great Britain or abroad. Thus the number of productive societies in the Coöperative Union actually declined from 108 in 1913 to 95 in 1919, while the number of members rose from 34,662 to 39,331. It is true that their annual sales during the period rose from £3,710,234 to £7,047,147, but the rise in prices would more than account for this increase. The history of the workers' society from 1907 to 1921 is, in fact, a repetition of its previous history. This form of industrial organization is liable to peculiar difficulties. A small self-governing workshop is easily started and a small workers' coöperative society easily formed. But the problem of internal organization and discipline is extremely difficult, if full democratic control is exercised by the workers. Hence in Britain, France and Italy workers' societies are continually coming into existence, but, with a few exceptions, their lives are short. And, since the larger and more highly organized the enterprise the more acute become the difficulties of organization, control, and discipline, the workers' society, where successful, has practically always remained a small and simple industrial unit. These facts account for the lack of development in producers' coöperation and its failure hitherto to adapt itself to the large-scale, complex organization of modern industry.

It should be noticed, however, that both syndicalism and guild socialism advocate forms of industrial organization which would in effect be developments of producers' coöperation. The workers' society takes the workshop or the factory as the unit of industrial organization and places the control of industry in the hands of the workers organized in factory or workshop; the syndicalist or guild socialist would make each industry, *e.g.* mining, railway transport or building, the unit of organization and would give control to the workers organized in these larger units. But, although experiments in guild socialism have already been made in England in the building trade, and although the Works Councils Act in Germany and legislation in Italy, following the seizure of factories by the workers in 1920, made some approach to a syndicalist control by workers, both syndicalism and guild socialism still remained in 1921 in the theoretical stage. They had, however, as theories and ideals of industrial organization, taken the place which previously workers' coöperation, in the strict sense, occupied with many people.

Coöperative Credit and Banking.—If the consumers' coöperative movements of the world owe their origin to the British movement, Germany can claim to be the pioneer of coöperative credit and banking. Two well-known types of credit societies are distinguished in Germany, the *Schulze-Delitzsch* and the *Raiffeisen.* Apart from their differences in constitution and structure, these two types are characteristic of a difference in function which runs through the whole of coöperative credit in every country. The Schulze-Delitzsch bank supplies credit or loans to the small industrialist in towns; the Raiffeisen bank supplies credit to farmers and agriculturists. This distinction of function is fundamental, and therefore it is not surprising that the history of the spread and development of urban and rural coöperative credit has not followed the same course.

It is obvious that neither large scale capitalist industry nor consumers, coöperation is favourable for the development of urban coöperative banks. The people whom Schulze-Delitzsch desired to help were townsmen, especially the small craftsmen working on their own account, the joiners, shoemakers and so forth; and his ideal was to do this by stimulating their thrift. The idea was to gather together into a society a number of persons, each individually weak economically, but whose combined capital, savings, and deposits would be sufficient to provide the credit upon which the bank might borrow money and lend it to its members. The membership of such an urban bank is always found to consist mainly of small craftsmen, shopkeepers, and small professional men. It follows that this kind of coöperative credit will only establish itself where the small independent hand worker still exists or where the small shopkeeper has an instinct for coöperation. But these conditions are not fulfilled in many European countries. Hence the success of urban coöperative credit has not been nearly so widespread as that of some other forms of coöperation. In Germany itself the movement was a great success during the first 50 years of its existence, but during 1910–21 it had not made much progress. Thus between 1859 and 1905 the number of Schulze-Delitzsch banks rose from 80 with a membership of just under 19,000 to about 1,000 with a membership of about 590,000: in 1921 the number of Schulze-Delitzsch credit societies organized in the general union remained about 1,000 with a membership of 600,000. Outside Germany the urban bank has established itself mainly in Italy, though it also exists on a small scale in France, Belgium and Switzerland. Its greatest success has been in Italy, where Signor Luzzatti was able to adapt the Schulze-Delitzsch model to the requirements of his own countrymen. As in Germany, so in Italy, the statistics of recent years pointed in 1921 to a very considerable slowing down in the growth of the movement. It should also be remarked that there is a tendency for the urban popular banks if they are financially successful, to lose their original object and function, *i.e.* they tend to neglect the small man for the big man, though there is probably some truth in the contention that this often results from the fact that the bank itself has helped its members to change from small men to big men.

The movement for rural coöperative credit associations has not been subject to the same limitations as the urban movement. In many Continental countries the peasant or small farmer exists in large numbers, and more often than not they are burdened by debt contracted with money lenders on usurious terms. In all these countries the scope for coöperative associations for providing credit to the small agriculturist is very great, and there has in fact been a considerable extension and development of this kind of coöperation. It has usually accompanied a development of other forms of agricultural cooperation, but one of the most curious characteristics of rural coöperative credit is that its development has been most erratic. Thus in Germany the whole of agricultural coöperation has developed from the Raiffeisen rural banks, and the credit associations remain the pivot of the whole movement. But at the other end of the scale are Denmark and Ireland. In no country in the world has agricultural cooperation been more successful than in Denmark, yet in 1921 rural credit societies or banks scarcely existed there. The growth of the Danish agricultural movement was singularly spontaneous, while Irish agricultural coöperation has been the result of intensive and prolonged propaganda. Yet the same fact with regard to coöperative credit is observable in Ireland: in some districts the rural credit societies have performed useful functions, but, taking the country as a whole, they have declined while agricultural coöperation has made great progress; this is shown by the fact that the number of agricultural credit societies declined from 267 in 1908 to 136 in 1920, while the number of agricultural societies and creameries rose from 458 in 1908 to 705 in 1918.

Between Germany at one end of the scale and Denmark and Sweden at the other, the different countries of Europe show great differences in the degree and manner in which they have accepted the rural credit movement. In Italy, Hungary, Finland and France, for instance, rural coöperative credit societies or banks have all proved successful, but as soon as the organization of the movement is investigated in the four countries, marked differences of development become apparent. One of the most important of these differences is the degree in which the movement does or does not rely upon State aid. Thus the Finnish banks are essentially voluntary associations which rely for their working capital mainly upon the Rural Banks' Central Credit Institute, while this central institute obtains its working capital very largely from Government loans. The Hungarian local credit societies in 1912 numbered 2,500 with a membership of between 600,000 and 700,000, and their capital voluntarily subscribed amounted to about £3,000,000, and deposits to about £8,000,000. For many years they relied in no way upon Government aid, but after the beginning of the century they received loans from a central credit organization financed almost entirely by the State. But it is in France that the reliance of agricultural credit upon the State is most marked. The French rural credit societies are grouped under a district bank to which a society wanting a loan applies; the district bank forwards the application through the Préfet to the Ministry of Agriculture, and the Ministry, if it approves, makes the loan to the district bank. The system is therefore little more than a system of State aid to agriculture and has scarcely any of the characteristics of voluntary coöperation.

Agricultural Coöperation.—Voluntary association among farmers, peasants, or agriculturists can and does take place for many different objects. In addition to the rural coöperative bank or credit society, already dealt with, the chief forms of agricultural coöperative organization may be classified as follows: (1) societies or associations for coöperative supply of the instruments and means of production; (2) societies or associations for coöperative production, *e.g.* creameries, dairies; (3) societies or associations for coöperative marketing; (4) societies or associations having a variety of miscellaneous coöperative objects, *e.g.* coöperative insurance. It should be noted, however, that there is no rigid separation of function in the societies actually existing: a single society may and often does perform two distinct functions; it may for instance, as in the case of a dairy, perform both the function of production and that of marketing.

There was a great and widespread development of agricultural coöperation in Europe, and indeed throughout the world, during 1905–20. Unlike consumers' coöperation, however, there was very little uniformity in the development of agricultural coöperation in the various nations. As was pointed out above, in one country the whole of agricultural coöperation will centre in the organization of agricultural coöperative credit, while in another country, like Denmark, a no less highly developed system of agricultural coöperation will exist with little or no organization of coöperative credit. But this lack of uniformity is not confined to agricultural banking; it will be found that in one country agricultural coöperation has developed principally along the lines of coöperative supply, in another of coöperative production, and in another of coöperative marketing. It is not possible, therefore, to give a general account of the progress of agricultural coöperation which would be applicable to every country in which it has proved successful; all that is possible is to show the range of its development and to give one or two typical examples.

In 1907 a fully developed agricultural coöperative system existed already in Germany, Switzerland, Denmark, France, Italy, and Belgium, and a real beginning had been made in Ireland. Up to the outbreak of the World War the old established systems continued to maintain themselves, but such statistics as are available seem to indicate that agricultural coöperation was more adversely affected by the war than the consumers' movements. But the most notable feature of the decade 1910–20 was the spread of agricultural coöperation and its progress in countries where before it was non-existent or only feebly established. The best examples of this development are to be found in the United Kingdom, Norway, Sweden, Finland, and Siberia.

Agricultural coöperation in the United Kingdom nowhere developed spontaneously. Its greatest successes have been obtained in Ireland, where the whole movement was created by the Irish Agricultural Organization Society, founded in 1894. Thanks to the educational work of this organization a considerable number of societies for supply, production, and marketing were formed on the model of Danish societies. The most successful societies were supply societies, dairies or creameries, and egg and poultry societies. By 1908 there were 292 creameries and 166 supply societies. In the next decade there was continuous progress, and by 1920 there were 334 creameries and 371 supply societies. The membership of the creameries rose from 42,404 in 1908 to 50,052 in 1917, and the turnover from £1,700,000 in 1908 to £5,200,000 in 1917, while the membership and turnover of the supply societies rose from 12,999 and £87,000 in 1908 to 31,200 and £691,000 in 1917. These figures indicate the trend of development in Irish agricultural coöperation. It contains two main features. The creameries are productive societies mainly occupied in the coöperative manufacture of dairy products, principally butter and cheese. In the early years of the movement coöperative production was for the most part confined to butter, but the war adversely affected the butter trade, and from 1914 to 1918 there was a big fall in the quantity of butter and a big rise in the quantity of cheese manufactured. The creameries and the Irish Coöperative Agency Society, which is a federation of creameries, also perform the function of coöperative marketing for their members. In recent years the development of the productive side of the movement in the creameries has slackened, and after 1919 conditions in Ireland led to great destruction of property and heavy losses for the creameries. The second feature of Irish coöperation is the rapid development in recent years of the "Agricultural Societies," which are supply societies providing the farmer with every kind of requirement at wholesale prices. They have had

a marked effect upon Irish agriculture, for the supply of such things as fertilizers and feeding stuffs at reasonable prices has created demand for them. The supply associations also perform an important function in providing agricultural machinery which the individual farmer could not possibly afford.

The example and success of the Irish Agricultural Organization Society led to the creation of similar movements and kindred societies in England and Scotland. In 1918 there were in England 237 supply societies with a membership of nearly 40,000 and a turnover of £4,670,000, and 39 dairies with a membership of over 5,000 and a turnover of nearly £1,500,000. In 1918 the total number of all societies in Scotland was 170 and the membership over 8,000.

In Sweden, Norway, and Finland the development of agricultural coöperation has been very rapid. In Sweden organized coöperation dates from 1906 when the "National Union of Swedish Agriculturists" was formed. This union acts both as a supply and a marketing organization. By 1910 the union had 42,000 members and a turnover of over £1,000,000, while there were 19 provincial and 940 local associations for supply and marketing; there were also 477 coöperative dairies. The development in Norway has been as great and even greater, and in 1913 there were 660 coöperative dairies and 1,344 local supply societies. Norwegian agricultural coöperation is remarkable for the highly organized system of federation among both productive and supply societies. Norway and Sweden resemble Denmark in the fact that agricultural coöperation has developed and succeeded with little or no reliance upon coöperative credit. Finnish agricultural coöperation is remarkable for the way in which the various forms of cooperation, credit, supply, production, and marketing have developed. This can be seen from the increase in the turnover of the various types of societies from 1903–13:—

	1903 £	1913 £
Dairies	140,000	1,480,000
Banks	8,000	356,000
Supply	80,000	480,000

The success of agricultural coöperation in Siberia has also been extraordinarily rapid. Coöperative butter-making associations were first started about 1900, and in 1908 the Union of Siberian Creamery Associations was established with 12 affiliated societies for the purpose of both marketing and supply. By 1914 the union had over 1,000 affiliated societies and a turnover of about £1,000,000.

COPPER (*see* 7.102).—The industrial history of copper after 1910 was more important, both technically and economically, than for many decades previously. A very large part of the world's supply of the metal came after that date from deposits so low in grade that they could not be worked under the conditions of 1905. The major developments in this progress were the enlargement of the scale of operations in individual units of stupendous capacity; immense reductions in the cost of mining by the introduction of the caving system and steam shovelling; reduction in the cost of milling and increase in the extraction of mineral by the introduction of the flotation process; reduction in the cost of smelting by the application of coal-dust firing to reverberatory furnaces and the successful operation of basic-lined converters, and finally the development of processes for the hydrometallurgical treatment of certain ores and the direct production of refined electrolytic copper.

These developments were to a large extent both the inspiration toward the exploitation of the "porphyry" deposits, and the consequences thereof. The porphyry deposits are more correctly described as fine disseminations of copper minerals through large masses of igneous rock. The economic characteristics of these deposits were mainly their large size and their occurrence at or near the surface in substantially horizontal positions. Fine disseminations of copper had been exploited for many years in the Lake Superior region, but there the copper occurred in its native form and the mineralization was in lodes dipping steeply. Previous to 1905 the occurrence of immense masses of rock, containing about 2% of copper in sulphide form, was known in Bingham Canyon, Utah, at Ely, Nev., and elsewhere, but it was not believed to be possible to exploit them profitably. The conception of profitable exploitation by taking advantage of improved methods in mining and the prosecution of operations on a previously unparalleled scale, was due especially to Daniel C. Jackling (b. 1869) of San Francisco. The provision of plant and equipment for carrying out that conception called for immense ventures of capital ($10,000,000 for single enterprises), and this at a time when success was problematical. Production by this new group of mines began about 1907, but it was not until about 1910 that it assumed large proportions and the success of the new enterprises began to be clearly recognized. The idea at that time was to work sulphide ores containing about 2% of copper, but in the short space of the 10 years following it became possible to work ores containing but little more than 1% of copper. The brilliant success of the porphyry copper mines and their ability to produce the metal at a very low figure stimulated the operators of lode mines, most notably the Anaconda Copper Mining Co., at Butte, Mont., toward improvements in methods in order to permit them to meet the competition of the porphyries.

Mining Processes.—The following are the major advances made during 1910–20 in the arts of mining and metallurgy:

Steam Shovelling.—No detailed description is necessary, for the steam shovels and general methods are substantially the same as are used in any excavation work. In their application to the mining of copper-bearing ore, the latter is broken down in benches, a line of holes being churn-drilled back of the face, charged heavily with an explosive, and the ore blasted down in quantities of many thousands of tons. The steam shovel is moved along a track at the bottom of the bench and picks up the broken ore, transferring it to cars alongside. Excessively large boulders are broken up by block-holing and blasting, but the steam shovel can pick up very large pieces, its dipper being as much as 8 cub. yd. in capacity. The largest steam shovels weigh 325 tons and dig 300 cub. yd. (place measure) per hour. This method of mining is so cheap per ton of ore that it can be applied economically even when it is necessary to shovel away 100 or 200 ft. of worthless overburden in order to uncover 100 vertical ft. of ore. The process of removing the overburden, technically known as stripping, necessarily precedes the actual mining. The laying out of plans for the working of a mine in this way and the figuring of the various factors furnish complicated engineering problems.

Caving.—When the overburden is too thick, or is too thick with relation to the thickness of the ore deposit, mining by the caving system is adopted. In essence this system consists in opening permanent galleries under the ore body. Raises to the ore body are then made, and sub-galleries of relatively small size are driven into it, with the purpose of so undercutting the ore body that its support by rock pillars is reduced to the minimum. Finally the pillars are blasted out, causing the superincumbent ore to settle in a great crushed mass. The crushed ore is then drawn off through chutes, previously prepared, into cars in the main galleries. This operation proceeds through the ore body section by section, the natural surface over the mines settling as the ore is drawn off. There are many modifications of this system of mining, but its application to large flat-lying ore deposits is substantially as described. Modifications of the caving system of mining are also applicable in many lode mines, when the lodes are of large size. It is a very economical system of mining owing to its reduced requirements for labour, explosives, timber, etc.

The Flotation Process.—Copper ore as mined at the present time contains generally only a small percentage of copper mineral, which is obtained by crushing the ore to such fineness as to liberate the mineral particles and by separating these from the worthless gangue by mechanical processes, commonly performed by washing, in which advantage is taken of the difference in specific gravities. Although there had been great improvements in the processes of ore dressing, the losses of valuable mineral continued relatively high up to 10 years ago. In the flotation process advantage was taken of the discovery that when ore suspended in water was mixed with a small

quantity of certain oils or other agents (the addition of oil being perhaps only 2 lb. per ton of ore), and was then subjected to violent agitation, the copper minerals (if sulphides) would rise to the surface in the form of a froth, while the worthless gangue would settle to the bottom. Separation in this way was possible at relatively low cost and yielded a far higher percentage of the mineral than the older processes. The improvement might be generalized by indicating an extraction of 90%, compared with 65 to 75% previously.

Metallurgy.—Previous to 1910 the blast furnace and the reverberatory furnace were frequently competitive choices for the smelting of copper ore. At one time one would be in the lead and then improvements would cause preference to be given to the other. With the increasing fineness of the ore to be smelted, the leaning began to be definitely in favour of the reverberatory furnace, but with the advent of the Dwight-Lloyd sinterer, which enables fine ores to be agglomerated cheaply and efficiently, the blast furnace gained a new prestige. With the successful application of coal-dust firing, however, which was due especially to the work of David H. Browne at Copper Cliff, Ont., the reverberatory furnace obtained an unquestionable predominance, which it is likely to hold. The modern copper-smelting plant designed for the treatment of fine ore comprises roasting furnaces of the MacDugall type and reverberatory smelting furnaces of very large size. Pr vious to the introduction of coal-dust firing, a furnace at Anaconda, Mont., 19 x 112 ft., smelted 240 tons of charge with one ton of coal per 4½ tons of charge. By the new method a furnace 25 x 144 ft. smelted 650 tons, and one ton of coal smelted seven tons of charge. For the smelting of coarse ore, and especially of heavy sulphide, the blast furnace operated on the pyritic or the semi-pyritic principle still held its place in 1920. These furnaces also were constructed of very large size. The Anaconda Co. attained dimensions of 72 x 1,044 in. at the tuyeres, but this was exceptional, the blast furnaces at most American works being something like 72 x 280 inches.

The converting of copper matte in a basic-lined vessel, which had long been a hope of copper metallurgists, was carried to success by W. H. Pierce and E. A. Cappelen-Smith at the works of the Baltimore Copper Smelting and Rolling Co., just previous to 1910, and early in 1910 the process was introduced in the works of the Garfield Smelting Co. in Utah. Subsequently it was found that the process was not limited to the Pierce-Smith horizontal converters, but could be applied to other forms of converters, both horizontal and upright. The main advantages of the basic over the acid converter are the decreased cost of lining (one basic lining for 2,500 tons of copper compared with one acid lining for 10 tons), greater air efficiency, ability to convert low-grade matte with a mixture of silicious ore, reduction of intermediate products, neatness and cleanliness of plant, and decrease in danger from accidents. The basic converters are lined with magnesite. Their use became general. They reduced the cost of converting copper matte to less than 50% of what it used to be with the converters lined with acid (silicious) material.

The existence of immense ore deposits of the porphyry type, but with the copper occurring as oxide or chloride, which rendered the ore unamenable to mechanical concentration, directed renewed attention to the hydrometallurgical extraction of the copper of such ore. At Chuquicamata, Chile, lies the world's greatest known deposit of copper, its development being estimated at about 700,000,000 tons assaying about 2% copper. Exploitation of this was undertaken by the Chile Copper Co., an American corporation. The copper occurs in the ore as brochantite contaminated with chlorides. E. A. Cappelen-Smith devised a process for the leaching of this ore with sulphuric acid, purification of the solution and deposition of the copper by electrolysis, using magnetite anodes, but in practice anodes of ferro-silicon have been substituted. The copper cathodes are melted and cast into bars of grade equivalent to standard electrolytically refined copper. Production in 1920 was at the rate of 100,000,000 lb. per annum. At Ajo, Ariz., the New Cornelia Copper Co. also produced electrolytic copper directly from ore, from which the copper was first leached by sulphuric acid. Hydrometallurgical extraction of copper was also applied on a large scale for the treatment of tailings, *e.g.*, by the Anaconda Copper Mining Co , and by the Calumet & Hecla Mining Co., the latter extracting the native copper by means of ammonia, and precipitating the copper as oxide by distillation, with recovery of the ammonia. A similar process was employed for ore treatment at the Kennecott mine, in Alaska.

General Economic Conditions.—A large part of the world's copper production was in 1920 derived from immense units. Thus in 1918 Anaconda produced 273,000,000 lb. of copper. This, however, was derived from a group of mines. The Utah Copper Co. produced 12,500,000 tons of ore in 1917, yielding 106,000,000 lb. of copper from a single mine. Previous to the World War about 15 cents per lb. was regarded as a market price reasonably to be expected on the average. The cost of production to the largest producers was about 10 cents per lb. The immense demand for copper for military purposes that began in 1915 temporarily outran the ability of the producers to meet it, and the price ran up to about 32 cents per lb. at the end of 1916; but the increased production began to show its effect in 1917 and the market declined materially during that year. In the latter part of 1917 the American Government fixed the price at 23½ cents. Mining, smelting and refining capacities were rapidly increased and in 1917 American electrolytic refiners attained a capacity for the production of 2,800,000,000 lb. of copper per annum. With the termination of the war it was found that all of the Allied and Associated Powers had overbought their requirements, and producers were unable to curtail their scale of operations quickly. This led to the greatest accumulation of unsold copper in the history of the metal, and combined with the greatly increased cost of operation, a bad economic situation developed in the industry which continued into 1921. At the end of 1920 the price for copper was about 12½ cents per lb. Statistics of the world's production of copper are given in the accompanying table.

Previous to the World War the world's production of copper had risen to an annual rate of about 1,000,000 metric tons. In 1916-8 there was an annual production of about 1,400,000 tons. In 1919 it was curtailed to slightly less than the pre-war rate. In April 1921 a general closing of copper mines became necessary on account of the economic situation, and the world's production was thus curtailed to about one-third of the pre-war rate. American interests control (1921) the major part of the copper production of Chile and Peru, and in fact control upward of 80% of the world's production. Outside of this control the production of Japan, Spain, Portugal, Australia and Africa is the most important, but of those countries Japan is the only one whose output has exceeded 100,000 tons per annum.

The best record of progress in the mining and metallurgy of copper, economic conditions, etc., is to be found in the file of the *Engineering and Mining Journal*, New York. Important technical

McGraw, *The Flotation Process* (1918); E. D. Peters, *Practice of Copper Smelting* (1911); and D. M. Levy, *Modern Copper Smelting* (1912). (W. R. I.)

CORDONNIER, VICTOR LOUIS ÉMILIEN (1858–), French general, was born at Surgy (Nièvre) March 23 1858, and after passing through the military college of St. Cyr entered the infantry as sub-lieutenant in 1879. Eight years later he graduated from the École de Guerre, and thereafter staff and regimental service (including tours of duty in the Alps and in Algeria) alternated till in 1905 he was appointed an instructor at the École de Guerre. He had already served as commander of the cadet battalion and director of studies at St. Cyr, and from this time till 1910 his work was wholly instructional. In this period he wrote his work *Les Japonais en Mandchourie* (published 1911), a study which soon took rank as the most important critical work on the Russo-Japanese War and was translated into several languages (English translation, *The Japanese in Manchuria*, Part I. 1912, Part II. 1914). In 1910 on promotion to colonel he took command of an infantry regiment and in 1913 he was promoted general of brigade and appointed to command the new 87th Brigade, forming part of the reënforced *couverture* created by the Three Years' Service Act.

In command of this brigade, Cordonnier played a distinguished part in the successful action of Mangiennes on Aug. 10 1914, and in the heavy fighting of the IV. Army in the Ardennes. Before the battle of the Marne he had been advanced to the command of the 3rd Division, and he led this formation in that battle and in the advance to Ste. Menehould and the Argonne which followed. On Sept. 15 he was severely wounded, and though he resumed his command in October, he had again to be invalided. In December, having meantime become general of division and an officer of the Legion of Honour, he commanded his division in the bitter trench-warfare fighting in the Argonne, and in Jan. 1915 he was in charge of a group of divisions in Alsace. From May 1915 he commanded the VIII. Corps in the St. Mihiel sector. In July 1916, having been meantime awarded the grade of commander in the Legion of Honour, he was appointed to command the French contingent of the Salonika armies grouped under Sarrail, which became the "Armée française d'Orient."

In general charge of the Allied left wing in Sarrail's autumn offensive he fought the actions of Ostrovo, Florina, Armenohor and Kenali, but owing to acute differences with Sarrail, which are discussed elsewhere, he returned to France just before the battle at Monastir which his movements and combats had prepared. He was already gravely ill, and immediately on landing in France was sent into hospital, where he underwent an operation for cancer. A command on the French front had been promised to him but he was never fit to take it up, and soon after the end of the World War he was placed on the retired list. He then devoted himself to historical and critical work on the war. In 1921 he published an account of the operations of the 87th Brigade under the title *Une Brigade au feu; Potins de Guerre.*

CORNELL UNIVERSITY (*see* 7.169).—The total enrolment of regular students in 1920 was 5,765 (including 1,127 women), divided as follows: graduate school, 407; college of arts and sciences, 1,812; college of law, 178; medical college, 312 in New York city and 37 taking freshman work in the Ithaca division of the college; New York state veterinary college, 103; New York state college of agriculture, 1,283; college of architecture, 130; college of civil engineering, 403; Sibley College of mechanical engineering, 1,210; duplicate enrolment, 110. In addition 2,171 students were enrolled in the 1919 summer session (especially for teachers) and 396 in the short winter course in agriculture in 1920. The students came from nearly all the states, territories, and insular possessions of the United States and from 38 foreign countries—*e.g.* there were 50 students from China, 30 from Europe, 25 from South America, 16 from Cuba, 7 from South Africa, 6 from Japan, 3 from Australia, etc.

In 1919–20 new endowment was pledged to the amount of $5,700,000 to increase teachers' salaries. The same year an anonymous gift was received of $1,500,000 to build and equip a new laboratory of chemistry; $500,000 from August Heckscher of New York for the endowment of research, and from other sources special gifts aggregating $708,000. Under the will of Goldwin Smith, $683,000 was received in 1911 for the promotion of liberal studies, and from Jacob H. Schiff, in 1912, $100,000 for the promotion of studies in German culture; in 1918 at Mr. Schiff's request the purpose was changed to the promotion of studies in human civilization, and in the same year Baron Charnwood gave 15 lectures on this foundation.

During the decade 1911–20 the university's physical growth continued; the state added 10 large buildings to the equipment of the two state colleges and built a new armoury for the department of military science; gifts of $350,000 from George F. Baker, a New York banker, and $300,000 from Mrs. Russell Sage provided four residential halls for students; Mrs. Florence Rand Lang of Montclair, New Jersey, added Rand Hall (machine-shop and electrical laboratory) to Sibley College. In 1919 the university's invested funds amounted to $14,076,500, yielding in the fiscal year 1919–20 an income of $738,100; the income from state and nation was $1,397,800, and from tuition fees $975,000. The grounds, buildings, and equipment were valued at about $7,637,400. The area of the campus was 359 ac. and that of the experimental farms (adjoining the campus) was about 1,100 acres. The appropriation made by the state to the College of Agriculture for the fiscal year 1920 was $1,800,588; in 1910 it was $412,000. The regular annual tuition fee in 1921 was $200, but in medicine it was $300; tuition in the two state colleges was free to residents of New York state. The university library in 1920 contained about 630,000 volumes. Among the important recent accessions were the Charles W. Wason collection of works relating to China and the Chinese, 9,309 volumes, presented in 1918; the James Verner Scaife collection of books relating to the American Civil War; and the engineering library of the late Emil Kuichling, 2,093 volumes, presented by Mrs. Kuichling in 1919. The Willard Fiske bequests have been described in three important bibliographies: *Catalogue of the Icelandic Collection* (1914), *Catalogue of Runic Literature* (1918), both compiled by H. Hermannsson, and *Catalogue of the Petrarch Collection* (1916), compiled by Mary Fowler. The results of the Cornell expedition to Asia Minor and the Assyro-Babylonian Orient were published in 1911. In 1920 appeared the fifth volume of the *Cornell Studies in English*, founded in 1916. Several volumes have also been added to the *Cornell Studies in Classical Philology*, the *Cornell Studies in History and Political Science*, and the *Cornell Studies in Philosophy*. The valuable law library numbered about 53,200 volumes. The law school publishes *The Cornell Law Quarterly* (established 1915). Since 1909 the governor of New York state has appointed five members of the university's board of 40 trustees; 15 are coöpted, and the alumni elect ten; others are *ex-officio* members. Since 1916 the faculty has sent three representatives to the board who sit as trustees, but without a vote. Andrew Dickson White (*q.v.*), who, at the request of Ezra Cornell, drew up the original plans for organizing the university and served as its first president, died at Ithaca Nov. 4 1918. Pres. Jacob Gould Schurman (*q.v.*) resigned in June 1920, and Prof. A. W. Smith, dean of Sibley College, was elected acting-president. Of the 21,445 degrees granted since the founding of the university, 18,992, or more than seven-eighths, were granted during President Schurman's 28 years of service. He was appointed U.S. minister to China by President Harding in 1921. Dr. Livingston Farrand (*q.v.*) was elected president in June 1921. Dr. Farrand, formerly a professor in Columbia University, was president of the university of Colorado from 1914 to 1919, and was then appointed chairman of the Central Committee of the American Red Cross. For two years he directed the work against tuberculosis in France under the auspices of the International Health Board of the Rockefeller Foundation.

During the World War the university, in coöperation with the

War Department, conducted at Ithaca a school of military aeronautics, a school of aerial photography, a school for military artisans, and a unit of the Students' Army Training Corps, and, at the medical college in New York, a school of röntgenology for officers of the U.S. Army Medical Corps. Many members of the faculty gave professional or technical service to the Government. About 7,000 students and former students of the university were in uniform; 1,500 of these were in officers' training organizations when hostilities ceased; of the others, 3,300, or 60%, were commissioned officers; 216 died in the service; 147 were decorated for distinguished services or gallantry in action. (W. P.)

CORONEL (German, *Santa Maria*), the name given to the naval battle fought on Nov. 1 1914 about 40 m. to the W. of Coronel (Chile), between a British cruiser squadron under Rear-Adml. Sir Christopher Cradock and the German East Asiatic Squadron under Adml. Graf von Spee.

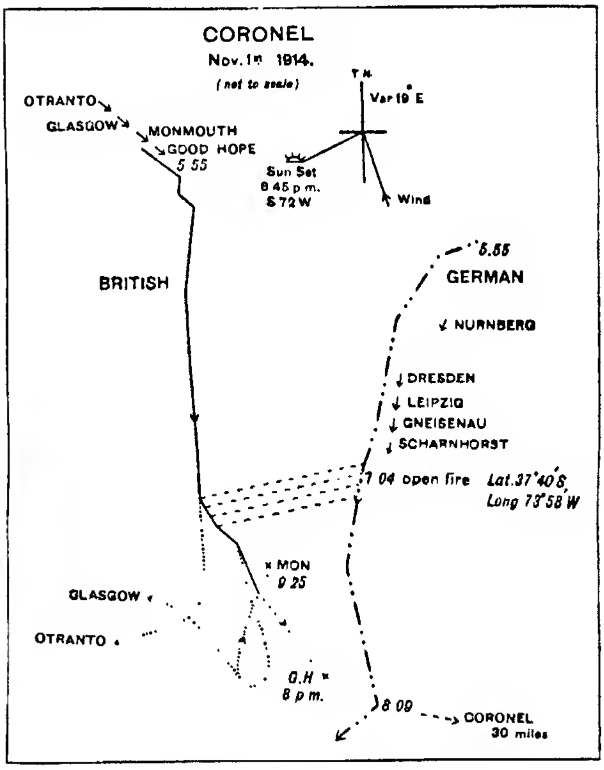
The British squadron consisted of the armoured cruisers "Good Hope" (flag., Capt. Philip Francklin: 1902, 14,200 tons, 2 9·2-in., 16 6-in., 21 knots) and "Monmouth" (Capt. Frank Brandt: 1903, 9,800 tons, 14 6-in., 22·3 knots), the light cruiser "Glasgow" (Capt. John Luce: 1910, 4,800 tons, 2 6-in., 10 4-in., 25 knots), and the armed merchant cruiser "Otranto" (Capt. Herbert M. Edwards: 16 knots, 4 4·7-in.). In the case of the first three ships the full sea-going speed is given. The German squadron consisted of the armoured cruisers "Scharnhorst" (flag) and "Gneisenau" (both 1908, 11,420 tons, 8 8-in., 6 5·9-in., 20½ knots) and the light cruisers "Leipzig" (1906, 3,200 tons, 10 4·1-in., 20 knots), "Nürnberg" (1908, 3,396 tons, 10 4·1-in., 22 knots) and "Dresden" (1908, 3,544 tons, 12 4·1-in., 25 knots). The figures, even as they stand, are sufficient to establish a definite German superiority, but they were accentuated by other circumstances. In the heavy weather prevailing at the time the "Good Hope" and "Monmouth" could not fight their main-deck guns, and their broadside discharge (including "Glasgow") was reduced to 2 9·2-in. and 12 6-in. with a weight of 1,960 lb. against the German 12 8·2-in. with a weight of 2,904 pounds. The Germans in addition had the inestimable advantage of having been in commission over two years and being in a state of prime gunnery efficiency, whereas the "Good Hope" and "Monmouth" were both 3rd Fleet ships, which had been lying idle in the dockyards, manned entirely with reserve men on the outbreak of war. The "Canopus" (Capt. Heathcoat Grant), another 3rd Fleet ship (with 4 12-in. and 12 6-in. guns), had been relegated by Rear-Adml. Cradock to purposes of convoy, as she could steam only 12 knots, and was 300 m. to the S. escorting two colliers when the action began. There can be little doubt that neither in guns nor in gunnery was the British squadron capable of meeting the enemy, and long before the fatal day it should have been reinforced by at least two cruisers of the 1st Cruiser Squadron, all of which were ships in long commission with good armament. ("Defence" carried 4 9·2-in., "Warrior," "Black Prince," "Duke of Edinburgh," 6 9·2-in.) This measure had been suggested, and even ordered in the case of the "Defence," but had never reached fulfilment. The "Black Prince" and "Duke of Edinburgh" were doing convoy work in the Red Sea and Indian Ocean, and the "Warrior" was at Port Said, while the "Defence" was with Rear-Adml. Stoddart on the east coast of South America.

Cradock left Vallenar (Chonos, Chile) with the "Monmouth" on Oct. 30 and proceeded N., leaving the "Canopus" to remedy engine defects and bring on colliers. The "Glasgow" had been sent on to Coronel (Concepcion) to send and receive telegrams, and a rendezvous had been arranged with her 50 m. W. of Coronel for Nov. 1. The junction took place at 1 P.M., and as the sea was too heavy for boats, the mail was floated to the "Good Hope." It had scarcely been opened, and the rear-admiral was probably just reading his telegrams, when at 1:50 P.M. German wireless sounded loud and clear.

Von Spee had come from Mas-a-Fuera, the last anchorage in his long Pacific trip. On Oct. 30 he had sighted the lofty ranges of the Andes, and the "Prinz Eitel Friedrich," an armed merchantman, had been sent into Valparaiso to coal, while the squadron cruised at slow speed out of sight of the port. At 3 A.M. on Nov. 1 she sent news of the "Glasgow's" visit to Coronel on Oct. 31 and the German admiral steered S. to intercept her.

Cradock, when the report of German wireless came in, had made a signal to spread 15 m. on a line of bearing N.E. by E. (in the order from westward—"Good Hope," "Monmouth," "Otranto" and "Glasgow"), course N.W. by N., 10 knots, to get in touch with the enemy. At 4:20 P.M. the line was not yet completely formed when the "Glasgow," to the E., sighted smoke and altered course N. 80 E. to get in touch with it. At 4:40 P.M. she reported the "Scharnhorst" and "Gneisenau" steering between S.E. and S. She turned at once to S. 65 W., closing at full speed on the "Good Hope," and the whole line began to close rapidly on the flagship. The "Canopus" was 300 m. to the S., toiling with her colliers in a heavy sea.

Von Spee had been steering S. at 14 knots. The "Nürnberg" and "Dresden" had been detached to examine passing ships, and the former was 25 m., the latter 12 m. in rear. About



4:15 P.M. von Spee was about 40 m. N. of Arauco Bay when the "Glasgow" was sighted to the W., and he turned and followed, working up to full speed. It had been blowing hard from the S.E. (von Spee says S.), and a heavy sea was running, hurling sheets of spray right over the conning towers; the sun was setting in the south-west. When the "Glasgow" sighted the enemy the "Good Hope" was some 26 m. to W. of her, and turned to the E. to join her squadron, as they came closing in. By 5:50 P.M. the British squadron was in line, with the "Good Hope" leading and the "Monmouth," "Glasgow" and "Otranto" behind, on an easterly course. The enemy were about 11 m. away to the E., steering south-westward (see map). Both squadrons now altered course to the S., and by 6:4 P.M. were steering approximately parallel courses at a range of about 14,765 yards. Cradock then seems to have tried to close in order to force an action while the sun was still high enough to dazzle the enemy, but von Spee turned away and Cradock resumed his southerly course. Had he not been hampered by the

"Otranto," which could only go 16 knots, it is possible that he might have attempted to fall back on the "Canopus," for the rest of his squadron was faster than von Spee's and he could have slipped away to the S. during the night and picked up the "Canopus" next morning. But this would have meant forsaking one of his ships, and Cradock was not the man to take this course. He decided to fight, and sent the "Canopus" a message to this effect at 6:18 P.M. At 6:20 P.M. he turned towards the enemy, but von Spee turned away an equal amount. He was now about two points before Cradock's beam, biding his time and waiting for the sun to set.

The "Otranto" asked if she was to keep out of range, and not getting a clear reply drew out of line on the "Glasgow's" starboard quarter, a potent reminder that a ship that has no guns to fight and no speed to run away is a delusion and a snare. The sun was setting (sunset at 6:45 P.M.), and as soon as it dipped beneath the horizon (just before 7 P.M.) the English ships were silhouetted sharply against the red glow of the western sky, whilst the Germans were scarcely discernible against the gathering night clouds in the east. About 7:4 P.M. von Spee turned one point towards the enemy to clear the smoke, and opened fire at a gun range of 11,373 yards. The conditions were rendered difficult by spray, heavy sea and smoke driving down the line, but the shot fell only 500 yd. short. The third salvo hit the "Good Hope" forward at about 7:0 P.M. and sent up a burst of flame. The rest of the German squadron joined in, the "Scharnhorst" engaging the "Good Hope," the "Gneisenau" the "Monmouth," and the "Leipzig" the "Glasgow." The "Good Hope" had now opened fire, but in the failing light the splashes could not be seen and her firing was poor and ineffective. In the next quarter of an hour the German gunners found the target again and again, and by half-past seven the British cruisers were obviously in distress. The roof of the "Monmouth's" fore 6-in. turret had been blown off and the turret was blazing. She had sheered off to starboard about 7:15 P.M., and the "Glasgow," which continued to follow in the wake of the "Good Hope," had to ease down to avoid masking her fire. A fierce fire had broken out amidships in the "Good Hope" and was increasing in brilliance. It was almost dark. Though the moon had risen about 6:30 P.M. it was still low, but the glare of the fires kindled in the British cruisers offered a sufficient target. At 7:45 P.M. the "Good Hope" was losing speed; the range had closed to about 5,000 yards. About 7:51 P.M. two shells struck her between the mainmast and after funnel, and a vast column of smoke and fire rose into the air. When it subsided the ship was still afloat, but she was nothing but a gutted hull lighted by a dying glare, and she fired no more. Thirty-five hits had been counted on her by the "Scharnhorst's" gunners. By 8 P.M. the fire had died down, quenched by the sea. The "Monmouth" had ceased fire and turned away to the W., followed by the "Glasgow," who had been heavily engaged by the "Leipzig" and "Dresden" and had received five hits. The rising moon shone fitfully through the clouds, and the "Glasgow" continued to fire at any ship that showed up, but as this only betrayed her position she ceased fire at 8:5 P.M. The "Monmouth," badly down by the bows and listing to port, turned N. at 8:15 P.M. to get stern to sea. But von Spee had now launched his light cruisers to attack and they were hot upon the trail. The "Glasgow" could only leave the stricken field, and she lost sight of the enemy at 8:50 P.M.

It was the "Nürnberg," which had been making frantic efforts to overtake her squadron, that found the unfortunate "Monmouth." She missed her with a torpedo and opened fire at 800 yards. The "Monmouth" was listing so badly that she could not use her port guns. The "Nürnberg" ceased firing for several minutes to allow her to surrender, then gave her a final broadside, and she went down at half-past nine with flag flying. The "Otranto" had fallen out and was now working gradually round to the S. towards Magellan Straits.

The British shooting was poor. The "Scharnhorst" was hit twice with little injury; the "Gneisenau" received three hits, one of which bent the flap of the after turret, an injury of little moment. This deficiency must be attributed partly to failing light and an inferior horizon but also to the fact that the ships had had scant opportunity for training and their fire-control equipment was poor. The squadron was weak in guns and gunnery. When the German squadron was sighted it would have been possible to fall back on the "Canopus," but this would have entailed the destruction of the "Otranto," which would have been overtaken by the enemy in two or three hours. Cradock preferred to fight and take the chance of inflicting injury on the German squadron, which was far from any base of refitment and repair. He fought a brave fight, checked von Spee in his onward career, and he and his men take their place in the great roll of naval heroes. His foe was a worthy antagonist. When the Germans at Valparaiso acclaimed him a naval hero, he shook his head. The wide spaces of the Pacific lay behind him, he had fought a famous battle, but the southern waters of the world lay before him, behind loomed the Atlantic, and he knew that Britain's arm stretched far. He found the sequel of his victory at the Falklands (*see* FALKLAND ISLANDS BATTLE). (A. C. D.)

CORSON, HIRAM (1828–1911), American scholar (*see* 7.204), died in Ithaca, N.Y., June 15 1911.

COSTA RICA (*see* 7.210).—The internal history of Costa Rica is almost continuously concerned with the transmission of the presidential office. In 1889 the first comparatively free election seated José Juaquín Rodríguez, a clerical Conservative. He ruled practically without assistance from the legislature until he made use of it to seat Rafael Yglesias as his successor. Yglesias was reëlected in 1898, but gave over the power in 1902 to Asunción Esquivel, after which time serious political revolts were infrequent. Fair liberty of the press was enjoyed, and elections were not abnormally corrupt. Cleto González Víquez was chosen president in 1906, and Ricardo Jiménez in 1910, both by popular vote. Alfredo González was named in 1914 by the legislature after the popular vote had failed to indicate a choice. The radical programme of González led to his forced removal by Federico Tinoco, who was elected to the presidency after his *coup* in 1917. Tinoco's power was minimized by his failure to obtain recognition from the U.S. Government. He was obliged to put down revolts in 1918; in 1919 a popular movement led by Julio Acosta drove him out of the country. Acosta, at first provisional president, was elected and inaugurated in May 1920. Costa Rica prospered under its recent rulers, who promoted public improvements, effected desirable sanitary measures, and promoted education. The landowners, professional men, and habitual politicians controlled the country, their politics being animated by clique and family considerations rather than by genuine differences in policy.

After 1913, the president, members of Congress, and the city officials were popularly elected. The president had large political patronage, dominating Congress. The judiciary was practically independent; its head was the Supreme Court, chosen by Congress. The central Government had more control over local affairs than was usual in Central America. Manhood suffrage was legalized in 1920, and the suffrage was extended to women also. During the World War Costa Rica was among the first of the Hispanic-American countries to evince sympathy with the Allied cause, although the German colony and German influence were strong. On Sept. 21 1917 the Government severed relations with Germany, and on May 23 1918 declared war on Germany. The pact for the Central American Union was signed in Jan. 1921 by Costa Rica, but was later rejected by the National Assembly. For boundary dispute, *see* PANAMA.

Finance and Economics.—During the period 1910–20 Costa Rican coffee was high-priced and a source of national prosperity. There was not, however, a large class of rich native landowners. On the plateau the small peasantry was prosperous and industrious. Foreigners controlled the mines, banks and commerce. The United Fruit Co. settled numbers of English-speaking people along the E. shore in the banana lands. From 1911 to 1918 the coffee crop ranged from 248,000 to 385,000 sacks, valued at from 8,221,000 to 14,789,000 colones (the colon equals $0.4653). In 1920 the coffee export was valued at $4,744,000. In 1918 the banana exportation

was worth 7,129,655 colones. The exportation of the principal variety, *musa sapientium*, is about 11,000,000 bunches per annum. In 1912 the foreign trade was $20,043,311. In 1917 the imports were $5,595,240 and the exports $11,382,166. In 1917 the national debt was $20,254,000. The national budget, approved by the President Jan. 7 for the fiscal year 1920, estimated the expenditure at 12,866,553 colones and the revenues at 13,006,000 colones, leaving a probable surplus of 139,447 colones. The estimated pop. in 1919 was 454,995; the area of the republic being about 23,000 sq. miles.

(H. I. P.)

COST OF LIVING.—Till recent years the phrase "Cost of Living" was only used loosely by economists when the balance between movements of wages and prices was in question, but from 1914 onwards during the World War the need of a measurement of the rise of prices gradually resulted in making the expression prominent in industrial and statistical discussions. In popular parlance it has since become a recognized economic problem. It has frequently been assumed that the term "Cost of Living" (or "High Cost of Living"—sometimes abbreviated to "H. C. L.") has a unique and definite meaning, and that accurate measurements can be applied to it, but in fact the meaning is vague and the statistical methods appropriate to it are complex and lead to results whose precision is not of a high order.

The phrase may be regarded as an abbreviation for "the cost in a defined region to persons typical of a defined social or industrial class of goods of a kind usually purchased at frequent intervals, by the consumption of which a certain standard of economic welfare is reached." We may usefully distinguish four cases: (*a*) where the standard is a physiological minimum; (*b*) where some conventional or average budget of expenditure is taken and the cost of the items in it is measured at different times or places; (*c*) where the items are varied but the whole contents of the budget result in an unchanged standard of welfare; (*d*) where both the contents of the budget are modified and the standard is raised or lowered. Case (*b*) is that which has in recent years been the subject of measurement, but case (*c*) is that which is in reality appropriate to the problem of measuring or adjusting real wages.

Case (*a*).—Prior to the World War attention was directed by Mr. Seebohm Rowntree (*Poverty, A Study of Town Life*, 2nd ed. 1902) to the cost of obtaining in York (England) and elsewhere food, clothing, heat, light and shelter sufficient for a family to maintain itself in health and efficiency for work, when all possible economy was practised, subject to the availability of commodities and the legal requirements for housing, decency, etc. The minimum of food was computed in relation to the quantity of calories, carbohydrates and protein calculated by Atwater and others as necessary for maintaining health and vigour under various conditions of life, and dietaries were drawn up which contained the necessary constituents at the minimum aggregate cost; to this cost was added the expenditure on clothing, fuel, cleansing materials, etc., and rent, which was found to be customary among persons in regular work at the lowest rates of wages of adult men. The most natural meaning of the cost of living is perhaps the cost of maintaining the minimum standard thus described. The standard is, however, not scientifically definite; apart from questions as to the validity and applicability of the measurement by calories, it is clear that there must be a great difference between the amount of food necessary for work of low and of high efficiency; the Indian, Chinese and Japanese peasants live on a sparser diet and produce a lower output than the English or Americans; definable points are where efficiency is a maximum (which needs a more liberal diet than that considered by Mr. Rowntree) and where the value of additional efficiency exactly equals the cost of the additional food, etc., necessary (for whose ascertainment there are no observations); and Atwater's standard is in fact conventional (see Bowley, *Measurement of Social Phenomena*, chap. viii., 1915). If we drop the word "minimum" and speak of Mr. Rowntree's conventional standard for demarcating poverty, we can properly measure the change in the cost of living at this standard (if the facts are ascertainable). The varying cost of the official civilian rations, computed in Germany *circa* 1919, gave a measurement similar to that described. The cost of Mr. Rowntree's standard, and one modified in the direction of ordinary purchasers by Bowley, was worked out for certain English towns in 1913 (*Livelihood and Poverty*, 1915). A legal minimum wage could be based on a standard thus defined, but in fact it is generally related to a higher conventional standard.

Case (*b*).—The usual method of measuring the change of the cost of living during and since the war has been as follows. Detailed statements of expenditure having been obtained from a number of working-class households (in most countries at some date prior to 1914), an average budget is formed showing so many pounds of meat, bread, etc., with the prices and expenditure in considerable detail. The average prices of the same foods are ascertained from time to time, and the expenditure necessary to purchase the former quantities at the new prices is computed. The cost of living (so far as food is concerned) is then taken as having increased or decreased in the same ratio as this standard budget. In many countries a standard of the same kind is established for clothing, fuel, light, rent, cleansing materials and some other articles, and the cost of the aggregate, including food, is computed from time to time. The result obtained (if the process were complete) would be the relative cost of maintaining a defined standard constant in every detail. It is generally expressed as a percentage; thus if the costs were 25s. and 30s. at the two dates, the ratio is 100:120, the index number at the second date is 120 and the percentage increase 20.

This method cannot be carried out in its entirety for two reasons, namely, lack of information and change of quality of the commodities in the market. In most countries data of expenditure and prices are only obtained for principal commodities (meat, bread, etc.) and not for those on which little is spent (currants, pepper, etc.); unless owing to shortage of supplies there is a run on the articles not included, these omissions cannot affect the result significantly. In some countries expenditure is not known, but only prices, and then the resulting calculation is generally valueless; and in others currency is so variable that the computation is meaningless. In nearly all cases there is no sufficient knowledge of expenditure on clothing either in total or in detail, and it is often difficult to obtain adequate data for fuel and light or for miscellaneous items. The sums included in the calculations, in fact, account for only a part of ordinary household expenditure, but where most care has been given to the question the part is a large proportion of the whole. Classes of expenditure that are not strictly necessary, such as amusements, tobacco, alcohol, etc., are generally omitted, as are occasional expenses (doctors, purchase of furniture, etc.), but in some cases subscriptions to trade unions, etc., insurance payments and travelling to work are included. The miscellaneous expenses omitted become a large proportion of total expenditure as we go up the scale of incomes. The difficulty due to the change of quality of goods which has been so marked since 1914 is even more fundamental. Over any long period the actual constituents and quality of a pound of bread, a cut of meat, a pair of boots, change considerably, but from some points of view these gradual changes are not important. During the war, however, substitution of one commodity or ingredient for another was sudden and common, and the pre-war quality was unobtainable at any price, or if obtainable had a quite altered position in domestic economy. Consequently the prices included in the calculations were frequently not for the same things at different dates and the precision of the measurement was greatly diminished. After the Armistice there was some return to former qualities, but the change has been sufficient to undermine the foundation of the numbers, and a new basis is necessary, as discussed in the following sections.

It should be added that separate budgets ought to be formed (and in some countries have been formed) for different grades of income and for different classes of occupation, and also for single persons and for married persons with dependents.

The structure of the index numbers of the cost of living is shown most clearly by algebraic symbols. If Q_1, Q_2, Q_3 . . . are the number

of units of the commodities in the standard budget, and P_1, P_2, P_3 . . . the prices per unit at the date taken as starting point, and we write $Q_1 \times P_1 = E_1$, $Q_2 \times P_2 = E_2$ . . ., where E_1, E_2, E_3 . . . are the expenditures on the commodities, then $E = E_1 + E_2 \ldots = Q_1P_1 + Q_2P_2 \ldots$ is the whole expenditure at the first date on the standard budget. Let p_1, p_2, p_3 . . . be the prices per unit at a subsequent date; then $Q_1 \times p_1 = e_1$, $Q_2 \times p_2 = e_2$ . . . are the presumed expenditures, and $e = e_1 + e_2 + \ldots = Q_1p_1 + Q_2p_2 + \ldots$ is the whole expenditure. The ratio of the cost of the standard budget at the second date to that at the first, is $\frac{e}{E} = \frac{Q_1p_1 + Q_2p_2 + \ldots}{Q_1P_1 + Q_2P_2 + \ldots} = \frac{E_1r_1 + E_2r_2 + \ldots}{E_1 + E_2 + \ldots}$ where $r_1 = p_1/P_1$ (the price ratio for the first-named commodity at the two dates), $r_2 = p_2/P_2$ . . . . The last expression shows that by this method the ratio of the costs of living is a weighted average in which the price ratios are weighted by the expenditures at the first date; hence we only need to know these expenditures and ratios, and not the actual quantities nor prices. In the official measurement in the United Kingdom only the quantities E and r are in fact used; this method is very convenient in dealing with rent (for which there is no natural unit of quantity) and with clothing (for which a general price ratio is obtained without any definition of unit). The general theory of weighted averages shows that a considerable roughness in the estimation of the smaller expenditures is smoothed out in the process of averaging, but that it is important to obtain precision in the case of large items, such as clothing, treated in a single entry, and rent. It is important, however, that the r's should be accurately known when they differ much from one another, and the quality of the commodities that are priced should be the same at both dates.

The index number for the second date is $\frac{e}{E} \times 100$, and the percentage increase is $\left(\frac{e}{E} - 1\right) \times 100$.

Case (c).—It must be granted that when the cost of living is compared at two places or at two dates we ought not to assume that precisely the same quantities of the same commodities are purchasable in both cases, and in order to make a strict numerical comparison we need a test of equality of standard if not a means of comparing two standards. The problem so stated has not yet been completely solved. A measurement could be made on a strictly nutritive basis and the cost of purchasing in the most economic way the amount of calories (including the necessary protein) considered proper to health and efficiency could be ascertained in both countries or at both periods; but this would only give a theoretic solution, since it ignores the influence of custom and taste in diet, and, in fact, in developed countries relatively few people have been compelled to purchase their nutriment in the cheapest possible way. The actual practical question in England in 1921 was what was the cost of maintaining the pre-war standard of living in nutritive power and satisfaction or pleasure derived from food and clothing, allowance being made for changes in prices and available qualities. This statement introduces the vague word *satisfaction*, which it is not practicable to define exactly, though some mathematical methods based on economic principles have been suggested for ascertaining its equality in two cases.

It has been suggested (Bowley, "Measurement of Cost of Living," *Journal of the Royal Statistical Society*, May 1919, p. 354, and "Cost of Living and Wage Determination," *Economic Journal*, March 1920, p. 117) that an approximation could be reached by devising "a diet, based on available supplies, as nutritious, digestible and not less attractive than the pre-war diet, and estimate at what price it could now be obtained," or "to frame a new budget of goods obtainable, and, in fact, purchased, by housekeepers with the same skill of adjusting purchases to desires as in the case of the earlier budgets. Instead of measuring satisfaction by formula, we may recognize that it is subjective and a matter of opinion, and obtain from representative working-class women a budget which in their opinion would now give the same variety and pleasure as a selected budget of 1914, care being taken that the energy value is the same. The result would give a new conventional budget, the ratio of whose cost to (that of) the pre-war budget would give a rough measure of the change of . . . the cost of living." It should be added that this solution would only be definite if the "satisfaction" was obtained as cheaply as possible, it being assumed that before the war given sums of money were laid out to the best advantage. This method would only be satisfactory if fairly close agreement was obtained as to the equality of the new with the old standard.

Another method has been used in the case of comparison of the cost of living in two places. In 1905 the Labour Department of the Board of Trade (United Kingdom) initiated inquiries about the cost of living in the United Kingdom, United States, France, Belgium and Germany, and obtained budgets of expenditure in each country; the results are published in the official papers Cd.3864, Cd.5609, Cd.4512, Cd.5065 and Cd.4032. A comparison was made between the cost of living in the United Kingdom and in each other country on a double basis, as follows:—it was found that an English housewife purchasing in 1909 in the United States a week's supply of food as customary in England would have spent 38% more in the first-named country, the ratio of the costs of living being on this basis 100:138; on the other hand, an American housewife purchasing in England a week's supply of food as customary in America would have found her expenses reduced in the ratio 125:100 (Cd.5609, pp. lxvi., lxvii.). If these ratios had been reciprocate, either would measure the difference in the cost of living (so far as food is concerned); as it is, their divergence illustrates the want of definiteness in the problem. Now it is quite possible to obtain in any country a current budget to be compared with a pre-war budget and the method just described can be applied. Thus, in the *Journal of the Royal Statistical Society*, May 1919, p. 344, details are given of the standard pre-war British budget and of the average of budgets collected by an official committee on the cost of living in the last year of the war, in which the standard of living had been modified and had fallen somewhat. A housewife purchasing in 1918 the same qualities and quantities of food as in 1914 would have increased her expenditure in the ratio 100:212, while if she had purchased in 1914 the same qualities and quantities as in 1918 the ratio of the earlier to the later expenditure would have been 100:202. Both these are possible measurements (the first being identical with case *a* above), and where the difference between them is so moderate an intermediate number, such as the arithmetic or geometric mean (which are nearly coincident), 100:207 makes a plausible measurement of the change.

Another method, allied to that just described, gives perhaps the most practical solution, though its adequacy can hardly be proved from theoretic conditions. Obtain typical budgets of expenditure at two dates; compile a new or mean standard of quantities which item by item are the averages of the entries in the budgets; thus, if in one the consumption of 33 lb. of bread is stated, in the other 35 lb., enter 34 lb. in the mean standard; now find the cost of the mean standard at each date and take the ratio of these costs as the measurement of the change in the cost of living. In the example just used this ratio was found to be 100:204. (On the methods formerly used for this problem, see Palgrave's *Dictionary of Political Economy*, vol. iii., article "Wages, Nominal and Real," p. 640.)

If all prices rose in the same ratio the methods now described would necessarily yield the same result; the need for choice arises from inequalities of increase, including the case where the goods are no longer in the market as one where the price is indefinitely great. Now if at one date purchases are made so as to maximize the satisfaction in the outlay of the week's housekeeping allowance, as we may reasonably assume, and prices rise irregularly, it is evident that somewhat less will be bought of the commodities which have risen most and more of those which have risen least if a maximum is still obtained, and that consequently the increase in the expenditure necessary to obtain the same satisfaction as before is less than the increase if exactly the same quantities had been purchased. For example, if oranges are doubled in price and bananas increased only by one-half, more bananas and fewer oranges will be purchased.

If with the notation used above we also write q_1, q_2, q_3 . . . for the quantities purchased at the second date, the measurement obtained by using these quantities is $\frac{q_1p_1 + q_2p_2 + \ldots}{q_1P_1 + q_2P_2 + \ldots} = \frac{1}{100} I_2$ (say) instead of $\frac{Q_1p_1 + Q_2p_2 + \ldots}{Q_1P_1 + Q_2P_2 + \ldots}$ (as above) $= \frac{1}{100} I_1$ (say). If the small letters refer to a second place (instead of date), then as between England and America $I_1 = 138$ in the illustration $I_2 = 125$. For two dates the method illustrated from expenditure on food in England gives $I_1 = 212$ and $I_2 = 202$, and the suggested index number is $I_3 = \frac{1}{2}(I_1 + I_2) = 207$. The other method recommended is to take

$$I_4 = \frac{\frac{1}{2}(Q_1 + q_1)p_1 + \frac{1}{2}(Q_2 + q_2)p_2 + \ldots}{\frac{1}{2}(Q_1 + q_1)P_1 + \frac{1}{2}(Q_2 + q_2)P_2 + \ldots} \times 100.$$

It is easily shown that I_4 is always *intermediate* between I_1 and I_2, and by a more troublesome analysis that I_4 is *less* than I_1 when prices in general are rising and quantities consumed of individual goods have increased or diminished according as their prices have risen more or less than the average as measured by I_1; in fact

$$I_1 - I_4 = 100 \frac{(p_1 - rP_1)(Q_1 - q_1) + (p_2 - rP_2)(Q_2 - q_2) + \ldots}{(Q_1 + q_1)P_1 + (Q_2 + q_2)P_2 + \ldots}$$

where $100r = I_1$, and the factors in each term of the numerator are both positive or both negative under the conditions named. Hence, I_4 satisfies many of the fundamental conditions of the measurement required. Bowley (*Stat. Journal, loc. cit.*, p. 351) suggests as

a measurement of the loss of satisfaction in the case of a falling standard the expression

$$\left\{(Q_1-q_1)P_1+(Q_2-q_2)P_2+\ .\ .\ .\right\} / \left\{Q_1P_1+Q_2P_2+\ .\ .\ .\right\},\quad i.e.$$

the ratio of the cost of the decrease in quantity to that of the quantities at the first date, both valued at the prices of the first date; this method leads to I_2 as the index of the increase of cost of living, but it is not of general application for it does not give equal importance to the distribution of expenditure at both dates since I_2 does not involve Q_1, Q_2 . . . .

T. L. Bennett ("Theory of Measurement of Changes in Cost of Living," *Journal of the Royal Statistical Society*, May 1920) carries the argument further by important steps. With the notation already used, he supposes that a housekeeper gradually changes her purchases from quantities Q_1, Q_2 . . . at prices P_1, P_2 . . . to quantities q_1, q_2 . . . at prices $p_1\ p_2$ . . ., the quantity of each commodity bought being related to its price by a law of demand. He then shows that the increase of expenditure, when the final is compared with the initial date, viz. $e-E$, is algebraically equal to $X+L$, where

$$X=\tfrac{1}{2}(Q_1+q_1)\ (p_1-P_1)+\tfrac{1}{2}(Q_2+q_2)\ (p_2-P_2)+\ .\ .\ .$$

and $L=\tfrac{1}{2}(q_1-Q_1)(p_1+P_1)+\tfrac{1}{2}(q_2-Q_2)(p_2+P_2)+\ .\ .\ .$ and he identifies X as measuring the increased expenditure necessary to preserve the former standard of living and L as measuring increased satisfaction from increased consumption (or if L is negative a decrease).

This method gives a useful and simple test of the equivalence (as measured by satisfaction) of two budgets at different dates in the same country, for L should be zero, that is $q_1\cdot\tfrac{1}{2}(p_1+P_1)+q_2\cdot\tfrac{1}{2}(p_2+P_2)+\ .\ .\ .$ should equal $Q_1\cdot\tfrac{1}{2}(p_1+P_1)+Q_2\cdot\tfrac{1}{2}(p_2+P_2)+\ .\ .\ .\ .$ This test should be applied if the suggestion made above of constructing an equivalent budget for comparison is carried out.

If L is negative it would be necessary to add to expenditure e to make it equivalent to the earlier expenditure E, and Bennett, having regard to the changed purchasing power of money, suggests a somewhat complex and indefinite method of ascertaining the necessary amount; the index number for the cost of living may be written approximately $100 \times (e+L\sqrt{\tfrac{I}{100}})\ /\ E$, where I is chosen as one of the index numbers already written.

Case (*d*).—The problem with which many countries were faced in 1920 and 1921 was in reality not that of preserving a standard of living on the level of 1914, but of adapting themselves to a lower average standard, whatever the fortunes of favoured classes. This may be illustrated by the arrangement of the salaries of civil servants in England in Feb. 1920. At that date the official measurement (on method *b*) of the increase in the cost of living over 1914 was 130%. The full increase of 130% was awarded to persons with a wage of 35s. weekly (£91 5s. per annum), 60% was added to the residue of salaries up to £200, and 45% to the residue of the salary. Thus a man whose salary was £400 on the pre-war basis received an addition of £273⅞ (130% on £91 5s.=£118⅝, 60% on £108 15s.=£65¼, 45% on £200=£90), about 68% in all. This increment was increased or decreased by one twenty-sixth part for every complete movement of 5 points in the official index number averaged over certain periods. It appears to have been assumed on the one hand that the expenses of the middle class had not increased so much as indicated by the index number based on working-class expenditure, and on the other that the standard of living must be lowered—the higher the income the greater the fall. A similar scale was adopted at nearly the same date for railway officials. We are thus led to consider a conventional standard of living which changes from time to time. When there is no reference to a physiological minimum, the cost of living may be regarded as the cost of maintaining the standard customary to the social or occupational class concerned at a given time and place. In this sense the cost of living of Chinese labourers is lower than that of the Americans, though they pay the same prices for commodities. When "cost of living" is used in this sense it should always be accompanied by a reference to the standard attained. Thus the British Committee on the Cost of Living in 1918 estimated the average expenditure of working-class families in 1914 and 1918 and at the same time reported on the change of standard. In some of the statistics quoted below a conception of this kind is involved in the figure.

United Kingdom

(*a*) *Cost of Food.*—In the United Kingdom the basis of the official measurement of the cost of living is that of finding the cost of a standard budget of expenditure at various dates (see *Labour Gazette*, March 1920, p. 118, and *Report on Working-Class Rents and Retail Prices*, Cd.6955 of 1913, pp. 299 *seq.*). The standard budget was obtained from a collection of 1,944 records of weekly expenditure made in 1904; the average weekly family expenditure was 36s. 10d., of this 22s. 6d. was spent on food, and of the food 18s. 6d. is accounted for in the standard used prior to the war. A somewhat altered basis was taken in 1914. Rice, tapioca, oatmeal, pork, coffee, cocoa, jam, treacle, marmalade, currants and raisins (the expenditure on all of which was about 2s. 1d. in 1904) were omitted and fish and margarine added (an addition equivalent to 6d. in each case). It was assumed that, though prices had increased between 1904 and 1914, the relative expenditure (which alone enters into the computation) on the different commodities was unchanged; this assumption is too rigid but not unreasonable, and the facts otherwise known about price movements and consumption show that the error introduced is insignificant.

Relative importance being determined, the next step was to ascertain the movement of prices. Prior to 1914 the records were obtained exclusively for London, but it was shown (Cd. 6955, pp. 299 and 306) that from 1907 to 1912 the average movement was very nearly the same in provincial towns as in London. From Aug. 1914 statements of prices were obtained for 650 towns and villages.

The index numbers of the cost of living, so far as food is concerned, were then obtained by the method *b* described above; prior to 1914, the year 1900 was taken as base and the prices then equated to 100; from the beginning of the war July 1914 was taken as base.

The index number is in the form $100 \times (E_1r_1+E_2r_2+\ .\ .\ .)\div(E_1+E_2+\ .\ .\ .\ )$ where E_1, E_2 . . . are the expenditures on the separate commodities in the standard budget and r_1, r_2 . . . are the ratios of the prices at any particular time to the prices at the basic date. The values actually taken for the E's were as in Table I., being proportional to the expenditure.

Table I.

Bread	50	British meat:		Milk	25	Tea	22	Sugar	19
Flour	20	Beef	24	Butter	41	Coffee*	2	Jam*	4

1914 and onwards	88		100		105		22		19

Grand totals: before 1914, 360; after, 334.

*Omitted after 1914. †Omitted prior to 1914.

There are certain weaknesses in the method. It is assumed without explicit evidence that expenditure on meat was in the proportion 2s. on beef to 1s. on mutton, and that British and foreign meat were of equal importance, and the price ratios taken for meat are for four selected joints only; during the period 1915 to 1919, when the relative quantities available varied and relative prices were altered, this assumption affects the index numbers. The weight assigned to margarine is ar-

bitrary. The number of eggs consumed (about 12 per household per week) is based on summer records and is no doubt higher than the average for the year.

The resulting index numbers were as in Table II:—

TABLE II.

Index numbers of retail food prices in United Kingdom. (London only prior to 1914.) Average for year unless otherwise stated.

For the monthly figures from Aug. 1914, see the article PRICES.

During the war the validity of these figures was much weakened by the failure of the supplies necessary for the budget to be realized. In 1918 a committee on the cost of living (Cd.6980) collected 1,400 budgets from the urban working-class of a kind comparable with the standard budget already named. Among the differences found were the following (Table III):—

TABLE III.

Weekly Consumption of a Standard Family.

		1914	1918
Bread and flour	lb.	33.5	34.5
Meat	lb.	6.8	4.4
Bacon	lb.	1.2	2.55
Eggs (number)		13.0	9.1
Cheese	lb.	.84	.41
Butter	lb.	1.7	.79
Margarine	lb.	.42	.91
Sugar	lb.	5.9	2.83
Potatoes	lb.	15.6	20.0

The consumption in 1918 practically exhausted the supply, and the calculation of what the 1914 budget would have cost if the quantities had been available at the prices of 1918 was purely theoretical. The committee found that in fact expenditure on food was 90% higher than in 1914 at a date when the above index number showed an increase of 108%. The committee estimated that the nutritive value (measured in calories) of the 1918 budget was only 3% lower than that of 1914. Similarly a committee on the financial results of the occupation of agricultural land and the cost of living of rural workers (Cmd.76 of 1919) reported (p. 43) that the expenditure on food of agricultural labourers had increased 84% since 1914 at a date when the index numbers showed an increase of 108%, and that the nutritive value had fallen 3% as in the towns. Possible methods of measuring the change of the cost of living under such circumstances have been discussed above; here it is only necessary to say that the official index number is not valid.

After the Armistice supplies tended to return to their pre-war level except in the cases of sugar, eggs, butter and cheese; margarine of an improved quality took the place of butter to a considerable extent. The increase of prices over 1914, however, varied greatly from commodity to commodity; thus in March 1921 British beef and mutton were respectively about 161 and 176%, while imported beef and mutton were only about 109 and 100% above the level of 1914; sugar had risen 310%, butter 145%, eggs 200%, tea only 74% and margarine 67%. With this variation it is certain that an unchanged standard would not be composed of unchanged constituents and that (as argued above) the cost of living had risen less than the index numbers show, unless expensive substitutes had taken the place (*e.g.*) of sugar. There had been no information obtained, however, as to new arrangement of consumption up to the summer of 1921.

(*b*) *Other Commodities.*—Next in importance to food comes rent. The figure included in the index number allows for such increases for rates, repairs, etc., as are legally permissible and is accurate for persons who by remaining in the same house since 1914 have the benefit of the Rents Restriction Acts; the increase for those who have moved must have been very variable and for it no estimate is available.

The cost of clothing, which ranks next to rent in expenditure, is always very difficult to measure owing to the difficulty of defining the garments or stuffs purchased, and of assigning their relative importance in the budget, and also there was great variability in the qualities in the shops during 1914 to 1921. The difficulties can be understood by comparing the estimates and method of the Cost of Living Committee (*loc. cit.*, pp. 21–3) with those of the official index number described in the *Labour Gazette*, April 1921, pp. 178–9; the former found an increase of 96% between July 1914 and the summer of 1918, the latter reaches increases of 210% in June and 240% in Sept. 1918. The differences are partly attributable to the great variability of the increases among the articles in consequence of which the relative importance given to each has great effect, and in this respect the committee's measurement is the more systematic; and partly due to the difficulty of obtaining quotations for the same qualities of goods or in allowing for substitution. The question is too intricate to discuss here; it can only be suggested that the results have little precision, and that the process of obtaining an estimate based on a new budget in which modifications of custom are allowed for is even more necessary than in the case of food.

Fuel and Light present little difficulty when a general average for the country is in question since the retail prices of coal and of gas are ascertainable. The variation from north to south in price and consumption and that between winter and summer is not very important, since where coal is dear, gas is used for cooking, and in working-class households one fire is necessary throughout the year for cooking and this also provides heat.

The official index number allows only one-twelfth of the weekly expenditure for all items not already included, or about 1s. 6d. per household in 1914. This sum is exhausted by cleansing materials with a very small margin for tobacco, newspapers, household replacements, and fares. Insurance and trade-union subscriptions are not included, nor is alcohol.

The five classes of expenditure now named are combined in the following proportions, stated for clearness on the basis of a pre-war urban weekly expenditure of 37s. 6d. Food 22s. 6d., rent (including rates) 6s., clothing 4s. 6d., fuel and light 3s., sundries 1s. 6d. Here the proportions on food, rent and light rest on good evidence; that on clothing, for which the expenditure varies greatly according to the income and personnel of the family and for which there has never been a satisfactory investigation, is little more than a guess based on vague estimates; that on sundries is the residuum when other expenses are met and is probably too low.

The results are tabulated in Table IV:—

TABLE IV.

Official Measurement of Cost of Living in the United Kingdom.

	Food	Rent	Clothing	Fuel & Light	Sundries	All combined
Relative importances	60	16	12	8	4	100
July 1914	100	100	100	100	100	100
Dec. 1914	116	*	*	*	*	110 (approx.)
June 1915	132	*	125	*	*	125
Dec. 1915	144	*	135	*	*	135
June 1916	159	*	155	*	*	145
Dec. 1916	184	*	180	*	*	165
June 1917	202	*	200	*	*	180
Dec. 1917	205	*	240	*	*	185
June 1918	208	*	310	*	*	200
Dec. 1918	229	*	360	*	*	220
June 1919	204	105	360	*	*	205
Dec. 1919	234	117	370	185	*	225
June 1920	255	117	325	230	220	250
Dec. 1920	282	142	305	240	230	269
June 1921	278	145	300	255	210	219

The statistics are for the beginning of each month.

* Not stated separately at these dates.

The numerical importance of the criticisms indicated may be seen by computing the number for Dec. 1920 with the following alterations: suppose that the modification of diet (margarine instead of butter, decrease of sugar and eggs and increase of other foods) reduces the food index to 260, that the increase in clothing cost is half that shown (as indicated by the Cost of Living Committee for 1918) and the index is 200 instead of 305, and that rent accounts for 20% of all expenditure, food for 50% and sundries for 10%, instead of 16, 60 and 4% respectively, then the index number would be 225 instead of 269. This is, perhaps, an extreme hypothesis, but it has been suggested (Bowley, *Prices and Wages in the United Kingdom, 1914–1920*, p. 75) that a standard equivalent on the whole to, but modified in detail from, that of 1914 might have been attained throughout by an increase of expenditure equal to four-fifths of that officially stated (100+4/5 of 169=235 in Dec. 1920).

Other Countries

(*a*) *Cost of Food.*—The experience of other countries has been similar to that of the United Kingdom both in the dates of increase and in the difficulties of satisfactory measurement. Table V contains in summary form the index numbers showing the movement of food prices in all the countries which are known to publish official figures based on 1914 prices. Except in Belgium, where the index numbers are the simple average of prices of selected commodities, the measurement is made on the same method as in the United Kingdom and based on the expenditure found from a collection of working-class budgets, though in some countries the number of such budgets is very small. In some cases, noted in the sequel, some changes in commodities are introduced, and in others alternative measurements based on actual expenditure at different dates are given. These numbers are summarized from time to time in the *Labour Gazette* (London), the *Labor Review* (Washington), in the *International Labour Review* (Geneva), and in the *Monthly Bulletin* of the Supreme Economic Council; they are of course also to be found in the official publications of each country.

Though the movements are by no means uniform, the rise is universal, and, except for a temporary break after the Armistice, continuous in nearly all countries till at least July 1920.

The break in the rise occurred at various dates after June 1920, as shown by figures in Table VI.

Table VI.

Index Numbers of Retail Prices of Food.
(The level of 1914 is taken as 100.)

*Figures for beginning of following month.

The prices are of course strongly affected by the relative value of the currency in the countries, and some indication of the effect may be seen (Table VII) by converting them to a gold basis by means of the exchange on New York. July 1920 is taken as being near the date of maximum prices. Corresponding figures are also given for Jan. 1921.

Table VII.

	July 1920			Jan. 1921
	Food index number	Exchange on New York as percentage of parity	Deduced index number	Deduced index number
London	258	76.6	198*	210
Paris	373	39.4	146	151
Rome	318	27.6	88	71
Amsterdam	210	85.5	180	168
Stockholm	297	79*	235	230
Switzerland	235	88*	207	193
Australia	194	77 (approx.)	149	142
United States	215	100	215	169

*Obtained by converting through London, thus: 258 × 76.6 ÷ 100 = 198.

Thus if an American had come to London with $198 in July 1920 he could have converted them into as many £ currency as would buy as much food as $100 would have purchased in July 1914. In Rome he would have needed only $88.

Table V.

Index Numbers of Retail Prices of Food (based on the official statistics of the various countries).

*Notes.—*United Kingdom.*—The figures relate to the first day of the month following that named.

France, other towns.—The figures include fuel and light; the number 380 relates to June not July 1920.

Switzerland.—The numbers relate to June not July in each year.

Belgium.—The base is April 1914.

Netherlands.—In some accounts 217 is stated for July 1920 instead of 210; the basis in 1914 is the average for the year, not the month of July.

Spain.—The July figures are for the average April to Sept. and the Jan. figures the average Oct. to March each year.

South Africa.—The figures for 1914 to 1918 are the averages for the years, not July only.

It is evident that neither the currency reckoning nor a conversion to a gold basis show the real meaning of the increase of prices; we need also to know the change of income accruing to purchasers, on which some information is given below.

In *Germany* a calculation of a standard food budget based on official maximum prices in 200 localities was made monthly for the years 1914–9 (*Deutscher Reichsanzeiger*, Dec. 19 1919). Since the foods could not generally be obtained and there was much evasion of regulations the numbers have hardly even academic interest, and the more important information is that given below under cost of living. The numbers in question yield the following figures (Table VIII):—

TABLE VIII.

Index Number for Standard German Budget.

	1914	1915	1916	1917	1918	1919
Jan.	102	118	161	214	225	253
July	100	152	213	220	231	328

In *Finland* (*Abo Underrättelser*, Feb. 25 1920) it appears that the cost of 1 litre of milk, 5 litres of potatoes and 1 kilo. each of butter, flour, bread, meat, bacon, sugar and coffee rose from 11.68 to 106.23 Finnish marks between 1914 and the beginning of 1920, an increase in the ratio 100 : 909.

For *Japan* a correspondent of the London *Economist* (Aug. 9 1919) gave details showing that the expenditure on food of an ordinary family had doubled in Tokyo between the first quarters of 1916 and 1919.

(*b*) *Other Commodities.*—The preceding tables relate (with certain exceptions) to food only. In many countries index numbers of the cost of living including other expenditure are published with more or less regularity. The relative importance given to classes of expenditure in pre-war budgets is as shown in Table IX, each expenditure being expressed as a percentage of that allotted to food:—

TABLE IX.

	United Kingdom	United States	Norway	Sweden	Denmark	Holland	Rome	Milan	Canada	New Zealand	Uruguay
Food	100	100	100	100	100	100	100	100	100	100	100
Rent	27	35	33	34	35	35	21	18	66	33	77
Fuel & Light	13	14	9	11	11	14	12	7	19	11	—[f]
Clothing	20	43	26	25	28	28	16	19	—	26	56
Other items	7	69[a]	40[b]	58[c]	36	43[d]	11	16	—	39[e]	50

a including 13 for furniture; *b* including 3 for taxes; *c* including 14 for taxes; *d* including 2 for taxes; *e* including 3 for taxes; *f* fuel and light included in other items.

It is clear that the methods of establishing the original budgets varied greatly from country to country. Since rent has increased little for those who have not moved and clothing has increased greatly in expense a good deal depends on the relative importance allotted to these items.

The various countries have collected information about the cost of living at different dates in rather sporadic ways. Only the United Kingdom has computed a monthly index from the beginning of the war on a uniform system. No doubt the difficulties of measurement and of obtaining data described above have been experienced in all countries and it would require very detailed criticism to ascertain whether the basis of collection was sufficiently wide and whether the prices were typical. The numbers in Table X must only be regarded as approximate both in respect of amount and of date, but they indicate the periods of increase and show in which countries it has been most rapid. In most countries there has been a shortage of houses and a legal restriction on rent; the figures are based in general on rents which have been hindered from rising. Whether the index number of food exhibited in the previous table or that of the cost of living has increased most depends mainly on a balance between rent and the cost of clothing, and the latter must have been uncertain in all countries.

In general the index numbers show a nearly regular increase from 1914 to the end of 1918, stationariness in 1919 and a rapid rise to a maximum at the end of 1920.

Many of the figures have been given from time to time in the *Labour Gazette* (London) and the *Labor Review* (Washington) and in similar publications in other countries. For Table X they have been extracted from the originals in the country to which they relate as far as possible.

*Average for 1913. †The original figures for Amsterdam are based on a calculation for 1910–1; it is estimated from other data that prices rose 7% between 1910 and 1914 and the numbers are adjusted on this assumption, but they can only be regarded as approximate when 1914 is compared with other years; for the sequence beginning 1917 the relative numbers are correct.

In some other countries there have been occasional calculations on a similar basis. In *Uruguay* (*Boletin de la Oficina Nacional del Trabajo*, Montevideo, May–Aug. 1919) the increase in necessary expenditure from 1913 to 1919 is given as 44% for an unmarried and 36 or 37% for a married labourer. In *Argentina* (*Revista de Economia Argentina*, May 1920) the increases in food, rent and other expenses are stated as 32, 16 and 165% respectively from 1914 to 1918 and as 45, 50 and 150% from 1914 to 1919. For *Hungary* (*Labour Gazette*, April 1921) a statement is quoted that whole family expenditure was in Jan. 1921 47 times as great in currency as before the war; rent had only increased 67%. For *Germany* an estimate is given (International Financial Conference, Brussels, 1920, Paper vii., statistics of retail prices) that the index number for food, clothing, rent, fuel, etc., in 28 towns was 373 in April 1919 compared with 100 in Jan. 1914, and if 373 is taken for Frankfort-on-Main in April 1919 subsequent numbers for that town are: Sept. 1919 433, Nov. 1919 466, Jan. 1920 630 and March 1920 740.

Change of Standard of Expenditure

In all the tables so far given the index numbers are intended to measure the change in cost of an unchanged and unmodified standard, except that in Denmark there has been a slight change in the relative quantities of butter and other fatty substances. In a few countries, however, the actual change in expenditure ($100\Sigma qp \div \Sigma QP$ in the notation described above, instead of $100\Sigma Qp \div \Sigma QP$, the formula for unchanged standard), and in Amsterdam the index number, has also been calculated by using quantities currently bought instead of the original standard ($100\Sigma qp \div \Sigma qP$).

For the *United Kingdom* the Cost of Living Committee of 1918 (Cd.8980) compared the expenditure of a standard artisan family in 1914 and the summer of 1918, and found the increase to be 74% to June 1918 and 80% to Sept. 1918, when the increase on the standard budget was 100 and 110%; the difference was partly due to the methods of treating clothing; for food alone in June 1918 the increase in expenditure was 90% and in the cost of the standard budget 108%. The Ministry of Food also made a computation of the change in the cost of the average quantities of some principal foods consumed in the United Kingdom from time to time, yielding the comparison shown in Table XI:—

Table XI.

	Expenditure on Principal Foods*	Index Number for Standard Budget
July 1914	100	100
Feb. 1918	144	208
June 1918	181†	208
Sept. 1918	197	216
March 1919	181	220
Jan. 1920	215	236

*The figures in this column are those stated in the *Labour Gazette* for two months later, but it is known that the computation was in arrear of the facts, at least at the earlier dates.

†190 if all the foods of the standard budget were included.

The differences point to important modifications of diet under rationing and control of prices; the Cost of Living Committee found that the nutritive value had fallen very little.

In *Switzerland* an estimate was made by Dr. Jenny (*Journal de Statistique et Revue économique suisse*, 1918 fascicule i., pp. 76 *seq.*) of what he calls the "nominal" and the "effective" increase of cost. The nominal increase, viz. that of an unchanged standard of food, was 92% between 1912 and March 1917; the effective increase, viz. the increase of expenditure when allowance was made for the known or estimated diminution in the consumption of bread, meat and the increase in that of potatoes, was only 56.5%.

In *Milan* the cost of the food actually consumed has been estimated from time to time, and added to the cost of housing, fuel, clothing, etc., these being taken as an unchanged standard after July 1918. Some of the results are shown in Table XII.

Table XII.

Index Numbers Based on:

	Actual Expenditure	Cost of pre-war Standard
1914 Jan. to June	100	100
1918 Jan.	162	—
July	205	286
Dec.	259	351
1919 July	265	280
Dec.	287	352
1920 July	376	441
Dec.	441	534

In *Holland* (Amsterdam) a more elaborate method is used, for not only has the expenditure been ascertained at frequent intervals (unfortunately of only a very small number of families) but it has been computed (see Table XIII) what the quantities actually bought would have cost at pre-war prices.

Table XIII.

Index Numbers.

	Actual expenditure on food, rent, clothing, etc., at selected dates	Cost of actual quantities at pre-war prices	Cost of pre-war budget at current prices
1910–1	100	100	100
1917 Feb. March	113	128	132
Aug.	—	138	142
1918 Feb. March	120	146	165
Aug. Sept.	135	166	183
Nov. Dec.	128	161½	177
1919 March	136	166	184
June	152	180	195
Sept.	164	183	193
Dec.	173	200	205
1920 March	195	214	214
June	194	215	217
Sept.	—	222	223

Table XIII may be thus explained. Expenditure in 1914 was 5.78 fl. (ΣQP) weekly, in Dec. 1919 10.00 fl. (Σqp), an increase of 73% (first column). If the same quantities had been bought in 1919 as in 1914 they would have cost 11.85 fl. (ΣQp), an increase of 105% (third column); but if the 1919 quantities had been bought in 1914 they would have cost 5.00 fl. (ΣqP), and the ratio of the actual cost to this is 2, which multiplied by 100 gives the number in the second column. Thus the third column gives the index number $100\Sigma Qp \div \Sigma QP$, the usual type, and the second gives $100\Sigma qp \div \Sigma qP$ (where q is changed at each date). It is argued above that the true measure of the cost of living lies between the numbers in the second and third columns. It can be seen that considerable modifications of diet took place between 1914 and 1918–9, but that either they had been reversed or that their effect on cost was nil by 1920.[1]

(A similar computation of the budgets in 1914 and 1918 in the United Kingdom gives $100\Sigma qp \div \Sigma QP = 185$, $100\Sigma qp \div \Sigma qP = 202$ and $100\Sigma Qp \div \Sigma QP = 212$, for food only, numbers corresponding in order to the three columns just discussed.)

In *Sweden* an elaborate investigation (involving about 600 household budgets each kept for three periods of four weeks) was made in 1916, 1917, 1918. Besides calculating actual expenditure (Σqp) and the cost of a standard budget (ΣQp) the food value in calories is computed (*see* Table XIV).

Table XIV.

Index Numbers.

July	Actual expenditure on food	Cost of pre-war budget at current prices	Calories in food consumed	Cost of 10,000 calories
1914	100	100	100	100
1916	124	130	102	121
1917	155	173	90	172
1918	233	267	86	271

Expenditure thus increased less than the cost of a standard budget, but whereas in 1916 the nutritive value of the diet had increased, owing to some change from meat to cereals which afford more nourishment for the same price, in 1917 and 1918 the dietary was inferior owing to actual dearth and the cost of equal nourishment rose as rapidly as the food index number on the ordinary basis.

In *Egypt* it was estimated by its statistical department that the cost of living measured by the standard reached in March 1920 was for clerks 138% and for artisans 140% greater than that of the same standard in 1914 ($\Sigma qp : \Sigma qP$). For food, fuel and soap only the increases for artisans and labourers on the same basis were to March, July, Aug., Sept., Oct., and Nov. 1920 respectively 180, 181, 180, 180, 185 and 193% in Cairo; in parts of Egypt there was a fall in Nov. 1920.

Reactions of Prices and Wages

Prior to the war there was in the United Kingdom no direct reaction of retail prices on wages, for wage rates were deter-

[1] The double estimate is now given up and the index number is now computed on the standard of March 1920.

It is evident that neither the currency reckoning nor a conversion to a gold basis show the real meaning of the increase of prices; we need also to know the change of income accruing to purchasers, on which some information is given below.

In *Germany* a calculation of a standard food budget based on official maximum prices in 200 localities was made monthly for the years 1914–9 (*Deutscher Reichsanzeiger*, Dec. 19 1919). Since the foods could not generally be obtained and there was much evasion of regulations the numbers have hardly even academic interest, and the more important information is that given below under cost of living The numbers in question yield the following figures (Table VIII):—

TABLE VIII.

Index Number for Standard German Budget.

	1914	1915	1916	1917	1918	1919
Jan.	102	118	161	214	225	253
July	100	152	213	220	231	328

In *Finland* (*Abo Underrättelser*, Feb. 25 1920) it appears that the cost of 1 litre of milk, 5 litres of potatoes and 1 kilo. each of butter, flour, bread, meat, bacon, sugar and coffee rose from 11.68 to 106.23 Finnish marks between 1914 and the beginning of 1920, an increase in the ratio 100 : 909.

For *Japan* a correspondent of the London *Economist* (Aug. 9 1919) gave details showing that the expenditure on food of an ordinary family had doubled in Tokyo between the first quarters of 1916 and 1919.

(*b*) *Other Commodities.*—The preceding tables relate (with certain exceptions) to food only. In many countries index numbers of the cost of living including other expenditure are published with more or less regularity. The relative importance given to classes of expenditure in pre-war budgets is as shown in Table IX, each expenditure being expressed as a percentage of that allotted to food:—

TABLE IX.

	United Kingdom	United States	Norway	Sweden	Denmark	Holland	Rome	Milan	Canada	New Zealand	Uruguay
Food. .	100	100	100	100	100	100	100	100	100	100	100
Rent. .	27	35	33	34	35	35	21	18	66	33	77
Fuel & . Light .	13	14	9	11	11	14	12	7	19	11	—[f]
Clothing	20	43	26	25	28	28	16	19	—	26	56
Other . items	7	69[a]	40[b]	58[c]	36	43[d]	11	16	—	39[e]	50

a including 13 for furniture; *b* including 3 for taxes; *c* including 14 for taxes; *d* including 2 for taxes; *e* including 3 for taxes; *f* fuel and light included in other items.

It is clear that the methods of establishing the original budgets varied greatly from country to country. Since rent has increased little for those who have not moved and clothing has increased greatly in expense a good deal depends on the relative importance allotted to these items.

The various countries have collected information about the cost of living at different dates in rather sporadic ways. Only the United Kingdom has computed a monthly index from the beginning of the war on a uniform system. No doubt the difficulties of measurement and of obtaining data described above have been experienced in all countries and it would require very detailed criticism to ascertain whether the basis of collection was sufficiently wide and whether the prices were typical. The numbers in Table X must only be regarded as approximate both in respect of amount and of date, but they indicate the periods of increase and show in which countries it has been most rapid. In most countries there has been a shortage of houses and a legal restriction on rent; the figures are based in general on rents which have been hindered from rising. Whether the index number of food exhibited in the previous table or that of the cost of living has increased most depends mainly on a balance between rent and the cost of clothing, and the latter must have been uncertain in all countries.

In general the index numbers show a nearly regular increase from 1914 to the end of 1918, stationariness in 1919 and a rapid rise to a maximum at the end of 1920.

Many of the figures have been given from time to time in the *Labour Gazette* (London) and the *Labor Review* (Washington) and in similar publications in other countries. For Table X they have been extracted from the originals in the country to which they relate as far as possible.

*Average for 1913. †The original figures for Amsterdam are based on a calculation for 1910–1; it is estimated from other data that prices rose 7% between 1910 and 1914 aod the numbers are adjusted on this assumptioo, but they can only be regarded as approximate when 1914 is compared with other years; for the sequeoce beginning 1917 the relative numbers are correct.

In some other countries there have been occasional calculations on a similar basis. In *Uruguay* (*Boletin de la Oficina Nacional del Trabajo*, Montevideo, May–Aug. 1910) the increase in necessary expenditure from 1913 to 1919 is given as 44% for an unmarried and 36 or 37% for a married labourer. In *Argentina* (*Revista de Economia Argentina*, May 1920) the increases in food, rent and other expenses are stated as 32, 16 and 165% respectively from 1914 to 1918 and as 45, 50 and 150% from 1914 to 1919. For *Hungary* (*Labour Gazette*, April 1921) a statement is quoted that whole family expenditure was in Jan. 1921 47 times as great in currency as before the war; rent had only increased 67%. For *Germany* an estimate is given (International Financial Conference, Brussels, 1920, Paper vii., statistics of retail prices) that the index number for food, clothing, rent, fuel, etc., in 28 towns was 373 in April 1919 compared with 100 in Jan. 1914, and if 373 is taken for Frankfort-on-Main in April 1919 subsequent numbers for that town are: Sept. 1919 433, Nov. 1919 466, Jan. 1920 630 and March 1920 740.

TABLE XV.

	General Course of Rates of Wages	Retail Prices of Food in London
1902	93	91
1903	92	92
1904	92	92
1905	92	92
1906	94	92
1907	97	94
1908	96	96
1909	95	96
1910	95	98
1911	95	98
1912	98	103
1913	100	100
1914 (Jan. to July)	100	100

Both sets of figures in Table XV are computed from the XVIIth Abstract of Labour Statistics, except that the level of wages in 1914 is equated to that in 1913 on the ground of other information as to the absence of any important change. The basis of the computation of wages is not sufficiently wide to ensure minute accuracy, and since it depends only on changes of rates it does not allow for the slow but progressive increase of the average earnings of all workers due to the relative increase of the numbers in the better-paid occupations. The inclusion of fuel among retail prices hardly affects the numbers. Rent, however, is known (Cd.6955, p. xxviii) to have increased on the whole less than food prices between 1905 and 1912. The conclusion is that money wages increased nearly step by step with the cost of living in the 13 years in question.

No official index number of average wages had been published up to 1921 since 1913, but there is enough information to lead to a rough estimate (see Table XVI). It should be realized that the figures have not the necessary precision to allow minute calculations to be based on them (Bowley, *Prices and Wages in the United Kingdom 1914–1920*, p. 105).

TABLE XVI.

	General Course of Rates of Wages	Official Cost-of-Living Index Number
1914 July	100	100
1915 "	105 to 110	125
1916 "	115 to 120	145
1917 "	135 to 140	180
1918 "	175 to 180	205
1919 "	210 to 215	210
1920 "	260	250

The wage figures depend throughout on wages for a normal week (reduced in 1918 and 1919) or on changes in piece rates. During the war-years earnings increased so much more rapidly than wages, owing to various facilities for making additional money, that it is probable that an index number for earnings would show as high figures as those in the second column except in 1917. If, however, we pay attention only to rates for nominally the same work, it is seen that prices rose before wages from 1914 for at least three years. If the view is accepted, as argued above, that the official index number tends to show too great a rate of increase, then by July 1918 wages had caught up with prices, and, while in 1919 and 1920 they had slightly passed the official measurement of prices, in fact real wages increased in these years. In 1921 it was too early to trace the effect on wages of the fall of prices that began in the winter of 1920–1; apart from those cases where wages were bound to the cost-of-living figures by a formula, the first influence was felt in unemployment and consequently diminished average earnings, not on rates of wages.

Some examples of the formulae connecting wages with prices are given in the article on WAGES, and that governing civil service and salaries is stated above. The general effect was to increase or decrease weekly rates in a lower proportion than prices, but where the proportion was applied to a standard wage higher than that in 1914 the whole increase over that date was at some periods greater than that of prices. Thus the wages arranged in Jan. 1920 for a porter on the lowest scale were as follows:—

Rate of wages		Moneywages in relation to pre-war rate	Cost-of-living number	Real wages in relation to pre-war rate
22s. pre-war rate		100	100	100
40s. new standard rate		182	145	125
46s.	Sliding scale rates	209	175	119
51s.		232	200	116
56s.		255	225	113
61s.		277	250	111
121s.		550	550	100

If then the cost-of-living index really measures the value of money the porter is better off when prices fall. Where such an arrangement took effect a slight check was put on the circular influence of prices on wages and wages on prices.

So far we have considered the interaction of wages and the prices that enter into working-class expenditure. There is still the question how wages have affected the cost of the unit of output. A bricklayer and his labourer averaged about 14½d. an hour between them in the summer of 1914 and 45d. in the summer of 1920, *i.e.* three times as much as in 1914; owing to the reduction of hours their weekly rates were only 2¾ times the former rate. In industries in general the reduction of hours was rather less, probably about one-tenth on the average, and while the index number for weekly wages was 255 in July 1920 that for hourly wages would be about 285 (July 1914=100). There is no certain information by which to connect the change in the cost of an hour's labour with the cost of a unit of output. On the one side it was generally alleged that the pace of work had heen more or less intentionally reduced, though this is not substantiated by such figures for piece earnings as are available; and, though in factories there is some diminution of overhead expenses and waste time when the day's work is done in two instead of in three shifts, the general expense of salaries, interest on capital, rents, rates, etc., has to be met out of the diminished hours of work. No doubt the potential energy of the workman per hour is greater in a 48-hour than a 54-hour week, but the increase appears not to have been realized in 1919–20. On the other hand the high cost of lahour and of materials (especially coal) stimulates employers to economize their use. In engineering especially many improvements in machinery were made during the war, the use of oil and petrol having replaced in some cases that of coal; in agriculture labour is saved by the use of oil-driven tractors. It is not possible to estimate the net influence of these factors, nor to state numerically in general how far the increase of wages has affected the cost of the product to the purchaser. In the article on WAGES are shown the scanty data relating to the general movement of wages in other countries than the United Kingdom, and these can be brought into relation with the index numbers of food and of the cost of living given above.

In *Norway* wages in the summer of 1918 were about 90% and the cost of living about 160% above the levels of 1914. In April 1919 various rates of wages were from 130 to 210% and the average had probably increased to 180% above 1914, while the cost of living was the same as in the previous year. In spite of reduction of hours weekly wages appear to have gained on the cost of living during the year May 1919 to May 1920.

In *Denmark* a more detailed table (see Table XVII) can be given:—

TABLE XVII.

	Hourly earnings	Cost of living
1914	100	100
1918 Aug.	200	182
1919 Feb.	224	190
Aug.	338	211
1920 Feb.	358	242
Aug.	396	262

Hours were reduced in 1919 till at the end of the year an 8-hour day was usual as compared with 10 hours before the war. Real weekly earnings had evidently increased considerably be-

fore 1920, and in April of that year it was agreed that future increases should be proportioned to the cost of living.

In *Germany* we have the computation shown in Table XVIII. (*Labour Overseas*, Ministry of Labour, London, Oct.-Jan. 1920, p. 51):—

TABLE XVIII.

Date	Average weekly earnings of male adult	Weekly minimum cost of living (four persons)	Earnings in proportion to cost of living
	Marks	Marks	
Aug. 1913 to July 1914	35	29	1·21
Aug. 1919	100	130	·77
Feb. 1920	170	254	·67
Nov. 1920	210	316	·76

The Official Year Book of *New Zealand* (1919) gives figures which are shown in Table XIX.:—

TABLE XIX.

Year	Average minimum hourly rates	Weekly hours	Weekly rates	Retail food prices
1911	1000	1000	1000	1000
1912	1006	1000	1006	1035
1913	1036	998	1034	1055
1914	1087	986	1072	1102
1915	1094	985	1078	1218
1916	1152	983	1132	1290
1917	1200	982	1178	1384
1918	1258	982	1135	1513
1919	1418	979	1288	1537

More than the minimum may have been paid in skilled trades and other items of expenditure may have risen less than food.

Table XX. shows how earnings (as distinguished from rates of wages) moved in New York state in relation to the cost of living:—

TABLE XX.

	Average weekly earnings in factories in New York state	Cost of living index number for the United States
1914 Dec.	100	100
1915 "	107	101
1916 "	123	115
1917 "	140	139
1918 "	185	170
1919 "	209	193
1920 May	224	June 210

(A. L. Bo.)

COTTON, SIR HENRY JOHN STEDMAN (1845–1915), Anglo-Indian administrator (*see* 7.254), lost his seat in Parliament in 1910. He died in London Oct. 23 1915.

COTTON, JAMES SUTHERLAND (1847–1918), British man of letters (*see* 7.255), died at Salisbury July 10 1918. He contributed articles on Indian subjects to the *E.B.* and spent the later years of his life cataloguing European MSS. relating to India in the India Office library.

COTTON, AND COTTON INDUSTRY (*see* 7.256, 281).—The chief problems which faced the cotton industry after the beginning of the 20th century centred in the question of the supply of the raw material. Up to the outbreak of the World War the outstanding feature was the steady increase of the demand. The industry is unique in possessing fairly reliable statistics of the consumption throughout the world, these having been compiled with increasing completeness by the International Federation of Master Cotton Spinners' and Manufacturers' Associations since 1904. The last issue before the war (March 1 1914) contained actual returns from the owners of 132 million spindles out of an estimated world's total of 145 millions, or 91 % of the world's total mill capacity. These figures do not, of course, include domestic spinning, which in many countries, especially India and China, accounts for a large part of the local consumption, so that they must always be incomplete; but this does not greatly affect comparative statistics from year to year.

The possession of such statistics offered an opportunity to attempt a balance sheet of the world's production and consumption such as is given in Table A. During the war it was impossible to continue the world statistics of consumption of cotton of all kinds, but other figures for the American crop alone are available to bring the table down to date as far as was possible in 1921.

The causes of the increase of consumption may be briefly tabulated as follows:—

(1) The increasing wealth of the world, especially of those tropical and subtropical countries whose products are largely raw materials such as cotton, and which for climatic reasons happen to be also the largest cotton-using countries in the world.

(2) Improved methods of manufacture, and the discovery of new processes which made it possible to produce cotton fabrics of an entirely different character, quality and finish from those previously known. The old process of "mercerising," reapplied with new success, produced cotton fabrics with a finish and appearance closely resembling silk, while the additional process known as "schreinering" produced a surface like satin.

(3) Similar developments enabled cotton to be used not merely as an adulterant of, but as a really satisfactory substitute for, fabrics made from other textile materials, such as wool and linen, *e.g.* the raising process made it possible to produce cotton goods as much superior to the early attempts at woollen imitations as these were inferior to the real article. Cotton "damask" was also taking the place of the original linen.

TABLE XV.

	General Course of Rates of Wages	Retail Prices of Food in London
1902	93	91
1903	92	92
1904	92	92
1905	92	92
1906	94	92
1907	97	94
1908	96	96
1909	95	96
1910	95	98
1911	95	98
1912	98	103
1913	100	100
1914 (Jan. to July)	100	100

Both sets of figures in Table XV are computed from the XVIIth Abstract of Labour Statistics, except that the level of wages in 1914 is equated to that in 1913 on the ground of other information as to the absence of any important change. The basis of the computation of wages is not sufficiently wide to ensure minute accuracy, and since it depends only on changes of rates it does not allow for the slow but progressive increase of the average earnings of all workers due to the relative increase of the numbers in the better-paid occupations. The inclusion of fuel among retail prices hardly affects the numbers. Rent, however, is known (Cd.6955, p. xxviii) to have increased on the whole less than food prices between 1905 and 1912. The conclusion is that money wages increased nearly step by step with the cost of living in the 13 years in question.

No official index number of average wages had been published up to 1921 since 1913, but there is enough information to lead to a rough estimate (see Table XVI). It should be realized that the figures have not the necessary precision to allow minute calculations to be based on them (Bowley, *Prices and Wages in the United Kingdom 1914–1920*, p. 105).

TABLE XVI.

	General Course of Rates of Wages	Official Cost-of-Living Index Number
1914 July	100	100
1915 "	105 to 110	125
1916 "	115 to 120	145
1917 "	135 to 140	180
1918 "	175 to 180	205
1919 "	210 to 215	210
1920 "	260	250

The wage figures depend throughout on wages for a normal week (reduced in 1918 and 1919) or on changes in piece rates. During the war-years earnings increased so much more rapidly than wages, owing to various facilities for making additional money, that it is probable that an index number for earnings would show as high figures as those in the second column except in 1917. If, however, we pay attention only to rates for nominally the same work, it is seen that prices rose before wages from 1914 for at least three years. If the view is accepted, as argued above, that the official index number tends to show too great a rate of increase, then by July 1918 wages had caught up with prices, and, while in 1919 and 1920 they had slightly passed the official measurement of prices, in fact real wages increased in these years. In 1921 it was too early to trace the effect on wages of the fall of prices that began in the winter of 1920–1; apart from those cases where wages were bound to the cost-of-living figures by a formula, the first influence was felt in unemployment and consequently diminished average earnings, not on rates of wages.

Some examples of the formulae connecting wages with prices are given in the article on WAGES, and that governing civil service and salaries is stated above. The general effect was to increase or decrease weekly rates in a lower proportion than prices, but where the proportion was applied to a standard wage higher than that in 1914 the whole increase over that date was at some periods greater than that of prices. Thus the wages arranged in Jan. 1920 for a porter on the lowest scale were as follows:—

Rate of wages		Moneywages in relation to pre-war rate	Cost-of-living number	Real wages in relation to pre-war rate
22s. pre-war rate		100	100	100
40s. new standard rate		182	145	125
46s.	Sliding scale rates	209	175	119
51s.	Sliding scale rates	232	200	116
56s.	Sliding scale rates	255	225	113
61s.	Sliding scale rates	277	250	111
121s.	Sliding scale rates	550	550	100

If then the cost-of-living index really measures the value of money the porter is better off when prices fall. Where such an arrangement took effect a slight check was put on the circular influence of prices on wages and wages on prices.

So far we have considered the interaction of wages and the prices that enter into working-class expenditure. There is still the question how wages have affected the cost of the unit of output. A bricklayer and his labourer averaged about 14½d. an hour between them in the summer of 1914 and 45d. in the summer of 1920, *i.e.* three times as much as in 1914; owing to the reduction of hours their weekly rates were only 2½ times the former rate. In industries in general the reduction of hours was rather less, probably about one-tenth on the average, and while the index number for weekly wages was 255 in July 1920 that for hourly wages would be about 285 (July 1914=100). There is no certain information by which to connect the change in the cost of an hour's labour with the cost of a unit of output. On the one side it was generally alleged that the pace of work had been more or less intentionally reduced, though this is not substantiated by such figures for piece earnings as are available; and, though in factories there is some diminution of overhead expenses and waste time when the day's work is done in two instead of in three shifts, the general expense of salaries, interest on capital, rents, rates, etc., has to be met out of the diminished hours of work. No doubt the potential energy of the workman per hour is greater in a 48-hour than a 54-hour week, but the increase appears not to have been realized in 1919–20. On the other hand the high cost of labour and of materials (especially coal) stimulates employers to economize their use. In engineering especially many improvements in machinery were made during the war, the use of oil and petrol having replaced in some cases that of coal; in agriculture labour is saved by the use of oil-driven tractors. It is not possible to estimate the net influence of these factors, nor to state numerically in general how far the increase of wages has affected the cost of the product to the purchaser. In the article on WAGES are shown the scanty data relating to the general movement of wages in other countries than the United Kingdom, and these can be brought into relation with the index numbers of food and of the cost of living given above.

In *Norway* wages in the summer of 1918 were about 90% and the cost of living about 160% above the levels of 1914. In April 1919 various rates of wages were from 130 to 210% and the average had probably increased to 180% above 1914, while the cost of living was the same as in the previous year. In spite of reduction of hours weekly wages appear to have gained on the cost of living during the year May 1919 to May 1920.

In *Denmark* a more detailed table (see Table XVII) can be given:—

TABLE XVII.

	Hourly earnings	Cost of living
1914	100	100
1918 Aug.	200	182
1919 Feb.	224	190
Aug.	338	211
1920 Feb.	358	242
Aug.	396	262

Hours were reduced in 1919 till at the end of the year an 8-hour day was usual as compared with 10 hours before the war. Real weekly earnings had evidently increased considerably be-

huge surplus of the 1914 crop was rapidly being exhausted. It was not till the early summer of 1917, however, that matters came to a head, when the intensive submarine campaign made it impossible to maintain adequate imports of cotton. The Cotton Control Board was set up in Liverpool to ration the limited supplies available,[1] and at a later stage the British and Egyptian Governments set up a control scheme in Egypt to handle the 1918 crop by purchase.

Up to the end of the war, therefore, the supplies actually available remained very limited, and it was only due to the compulsory restriction of the consumption of the Central Powers that the supply was able to meet the demand at all. Unfortunately the Armistice was followed by a temporary period of hesitation and delay in getting things going again, which resulted in a serious fall in the price of cotton. This immediately reacted in a reduction of the acreage again in 1919 in America, and as this happened to coincide with another disastrous season, the 1919 supply was again extremely short. When on the top of this came the great post-war boom of 1919–20, in which the real needs of the world were exaggerated by the speculative hopes of those who saw fortunes in the reopening of the world's markets, prices simply broke all bounds and rose to figures which have perhaps never been equalled in the history of the trade. American cotton was over 2s. 8d. a lb., while the best Egyptian was over 10s. a lb. Indeed one of the features of the period was the extraordinary premiums paid for good staple cotton. This was largely due to the sudden rise of the motor trade in America. When it came out that at the beginning of 1919 there were over six million motor-cars in the United States (since increased to ten millions), it was obvious that the demand for that class of cotton would be large, and the Egyptian varieties were the most desirable for the purpose. The result was practically a corner in Egyptian, which drove the price up to $200 per kantar (100 lb.) in Alexandria, against an average of less than $20 before the war.

The subsequent slump in cotton was as dramatic as had been its rise. Within almost twelve months from the very top prices in Feb. 1920, American cotton had again fallen below pre-war prices, while Egyptian, which had so much farther to fall, reached almost the same point. The inevitable effect again was a movement for the reduction of acreage, which once more brought the world's crops for 1921 far below pre-war records.

[1] See *History of the Cotton Control Board* by H. D. Henderson (the Secretary) 1921.

In the meantime the world's trade had been brought almost to a standstill by the slump in demand everywhere. The extent of this is shown by the Federation statistics (Table C), which were resumed on July 31 1920 (the date of the cotton "season" having been in the meantime advanced by a month).

In their figures as at Jan. 31 1921, shown in the above table, it was possible to compare the consumption during the height of the boom with that of the pre-war year, and also with that of the first six months of the slump. The fact that the consumption even during the boom was not equal to the pre-war consumption is due, first, to the destruction of textile machinery in the devastated districts of France and Belgium; and, second, to the reduction of the hours of labour throughout most parts of the cotton world, which came into vogue immediately after the war. In 1919 the makers of textile machinery were utterly unable to cope with the demand for new machinery to replace that which had been destroyed during the war, or to make up the arrears of renewals which had fallen behind during the war. New machinery outside of these privileged requirements was practically unobtainable, with the result that the trade was unable to take full advantage of the boom in the demand by increasing its output. The high prices were therefore due not merely (if at all) to the shortage of the raw material, except perhaps in the case of Egyptian and other staple cottons, but rather to a shortage of cotton goods.

Prospects in 1921.—It may seem paradoxical to speak of possible scarcity at a time (Aug. 1921) when the actual demand for cotton goods seemed almost at a standstill, and the world was apparently over-stocked not only with cotton goods, but also with the raw material. Yet there could be no practical doubt that the world would ere long be seriously short of cotton again; because it could only be a question of time till a return to something like normal conditions of demand would again lead to a consumption of cotton substantially in excess of what the world was producing. The abnormally large carry-over which was accumulated during the slump might prevent any scarcity arising within the immediate future, but it could hardly be doubted, unless the world was to face a prolonged period of practical starvation, that the consumption of cotton, which is the cheapest textile in the world for many other purposes besides clothing, could not permanently remain at the low level of 1921. The question was whether, when the demand came again, the supply would be as quick to respond as it was to contract when prices fell. It was extremely unlikely that pre-

war conditions would ever again be reproduced in America. Then the crop was increasing slowly, but on the whole steadily, and in 1914 the actual growth was probably not less than 17 million bales, though this record total never came "into sight" during the season. It was clear that, at anything like the 1921 level of prices, and indeed under almost any conditions which could then be visualized as possible, the world could not look to America to equal that figure again or to resume the pre-war rate of increase. The difficulties in America were the extremely variable climate, the scarcity and high cost of labour, and the reduction of the average yield owing to the spread of the boll weevil; and although the cost of production would probably be substantially reduced again, it would take a price very much higher than the 1921 level to tempt the growers back again from the policy of diversification, which they had been taught since the war, to their old policy of cotton and nothing else.

The basic fact of the situation in 1921 was that prices were substantially below the cost of production, and this was a state of affairs which could not continue. It is true that where so much of the labour—and cotton is essentially a cheap-labour crop—is supplied by the grower himself and his family, they may for a time submit to a reduction of price which will not cover an adequate wage for their labour; but even where mobility of labour is low, as it is in the American cotton belt, such a state of affairs is bound in course of time to have its effect. It did so very strongly during the war when a large quantity of labour left agriculture in the cotton belt for the more highly paid industries in the Southern towns or in the industrial North; and while the subsequent slump had, for the time being reversed this tendency, it was extremely improbable that the South would again become resigned to a permanent lowering of its standard of living, especially as the policy of diversification in itself enabled them to meet this difficulty by supplying many of their requirements from their own land, instead of putting it all under cotton. The probability was, therefore, that it would require a substantially higher price than in pre-war times to induce America to return to her pre-war acreage.

A further point of detail may be noted. Part of the American crop before the war, the Sea Island crop, grown in Florida and Georgia, and on the so-called "Islands" off the coast of South Carolina, was the best cotton in the world, because its staple was the longest and finest; but this crop had by 1920 been virtually wiped out by the advent of the boll weevil in these districts, and the gap thus created would be extremely difficult to fill. The only supply of a similar kind which America could offer was the small crop of excellent cotton of Egyptian character which had for some years been growing in Arizona and California, especially in the Salt River Valley in the former state. The crop amounted in 1920 to 92,000 bales grown upon a total area of about 256,000 acres; but that was largely due to the high prices of 1919–20 and was not likely to be repeated. For the very best cotton, therefore, the world was entirely dependent on the West Indian Sea Island crop, which, however, was only about 7,000 bales, against the pre-war figure of about 100,000 from Florida and Georgia.

The supply of fine cotton was still further diminished by the serious reduction of the Egyptian crop, due to several causes, of which the most controversial was the view that drainage had not kept pace with irrigation, leading to a rising "water table" and partial water-logging of the lower zones in the Delta. The ravages of the pink boll worm in recent years had also contributed to the reduction of the average yield, which had become serious even before the war, and still more so since 1914. To counteract this reduction would require very heavy expenditure; and the further development of the Egyptian area was apparently dependent on the execution of large irrigation works, the chief of which, the White Nile Dam, above Khartum, had been begun, though work was suspended in the meantime through lack of funds. The most striking development in Egypt, however, had been the replacing of the original Delta type of cotton (Afifi) by the new longer-stapled variety Sakelarides, the best of which has to some extent taken the place of the lost Sea Island.

In view of the reduction of the Egyptian crop the possible development of the Sudan became of the greatest importance. The Gezira scheme, which was expected to provide the larger part of the crop, was also dependent on large irrigation works on the Blue Nile, in course of construction in 1921. Other parts of the Sudan, such as Tokar, Kassala and certain areas on the Nile north of Khartum, were of considerable promise, but large expenditure on transport and irrigation was still required there, especially for the Tokar and Kassala districts.

Great hopes have been entertained of the development of cotton of the ordinary American inch-staple in India, where it is regarded as relatively long-stapled in comparison with the $\frac{5}{8}$ in. to $\frac{7}{8}$ in. staple cotton which forms the bulk of the Indian crop. This development has had the active support of the Government, who in 1917 appointed a special commission to make a survey of the whole position (see *Report of the Indian Cotton Committee, 1919*). For many years to come, however, these improved cottons could not hope to form a large part of the total Indian crop. Since the formation of the British Cotton-Growing Association in 1902 attention had therefore been directed to other parts of the Empire, and much pioneer work had been done in proving the possibilities of many districts, especially in Africa. Distinct success has been achieved in West Africa, where the best cotton is of a good American type, and in Uganda and Nyasaland, where varieties akin to the American long-stapled upland have been produced. The development of all these districts was, of course, seriously checked by the war, and subsequently by the high cost of the necessary development works, such as transport. The war also left a great gap in the supply of skilled men of all kinds, whose services were everywhere required for the development of new cotton-fields. Everything depends in the first place on the maintenance of an adequate seed supply, which involves not only the finding of a suitable variety, but also the maintenance of a pure supply. Much had also been done in promoting improved methods of agriculture, in providing the necessary facilities for the ginning, baling, and handling of the crop, and for its marketing at adequate prices, especially in the case of superior varieties. In South Africa also excellent cotton had been grown in small quantities, but the necessary organization of the trade had still to be provided before it could be a success on a large scale. Other foreign Powers with colonies in Africa had also done a great deal for the development of cotton, but up to 1920 the total quantity produced in all these new areas in Africa (outside of Egypt) was relatively small, and the time when Africa could produce a million bales of cotton was still far distant (see *Report of the Empire Cotton-Growing Committee of the Board of Trade*, Cmd. 523, 1920).

In Australia there was little doubt that cotton could be successfully grown, either by rainfall or under irrigation; but there were problems to be faced with regard to the labour supply as well as the ordinary difficulties of organization.

There are many other countries which could provide large additions to the world's cotton supply if all the necessary conditions of the successful organization of the industry could be secured. Brazil, for example, could undoubtedly yield a very much larger crop than it has ever done (500,000 bales); but political as well as labour and other economic difficulties are apparently serious. The Argentine is also a country where excellent staple cotton has been grown, but labour seems to be the chief obstacle to its development on a large scale. Many of the other Latin-American countries, especially Mexico, also have great possibilities for cotton-growing. Peru produced a small crop (about 200,000 bales) of excellent staple cotton, a little below Egyptian in value, but much of it better than the staple American upland. The supply of the latter from America itself suffered a severe loss when the boll weevil appeared in the the Mississippi Valley and drove out the old $1\frac{1}{2}$ in. long-staple cotton that used to be produced there. Subsequently, however, a great development took place in the production of new staple upland varieties of about $1\frac{1}{4}$ in. staple in southern Carolina, the Mississippi Valley and northern Texas; but their total supply probably did not exceed 250,000 bales per annum.

In Asia the chief crops before the war, apart from India, were in China and Asiatic Russia, including Transcaucasia. Statistically, the Chinese crop has always been a mystery, and its amount can only be guessed at about two million bales. The Russian crop had before the war risen rapidly to nearly 1½ million bales, part of which was of indigenous varieties similar to the Indian, and the remainder of good American quality; but this crop had been almost wiped out by the war, and it was not likely to recover as long as Russia remained in chaos.

The Cotton Industry.—The growth of the cotton industry throughout the world has already been indicated by the figures of spindleage given in the appended tables. Perhaps the most interesting feature up to 1921 had been the development of the American, Japanese and Indian sections of the trade. The first was largely due to the growth of the Southern mills, which had increased from ten million spindles in 1910 to 15 millions in 1920. In Japan the percentage increase of spindles had probably been greater than in any other country, though the total in 1921 was still comparatively small. The output of the Indian mills had also advanced in recent years, both in quality and quantity; but this unfortunately raised bitter controversy with regard to the Excise duties, which were imposed on the product of Indian mills in 1896 to balance the 3½% Customs duty[1] imposed for Revenue purposes on cotton goods imported into India. In 1917 the import duty was raised to 7½% without a corresponding increase in the Excise duty; and in 1921 the differentiation was still further increased by an addition of 3½% to the import duty. Table D shows the growth of the Indian cotton industry since 1911.

The facts with regard to the foreign trade of Great Britain in cotton and cotton goods are shown in Table E (See p. 769).

Number of Operatives.—In Table F are given the latest figures obtainable in 1921 as to the number of British operatives engaged in the cotton trade since the date of the Census of Production in 1907:—

TABLE F.—*Numbers employed (in thousands).*

Date.	Males.	Females.	Total.
1907	218	359	577
July 1914	274	415	689
Nov. 1918	144	349	493
July 1920	218	396	614
Nov. 1920	211	376	587

The controversial question of the employment of half-timers in the trade moved a step forward in England by the Education Act of 1918, which provided for their gradual abolition.

Wages.—With regard to wages, the outstanding feature of the British cotton industry was for many years the excellent organization both of masters and men, as the result of which wage disputes in the trade have, ever since the famous Brooklands Agreement of 1893, been reduced to a minimum. It is perhaps also due to this organization that, as a class, the cotton operatives of Lancashire are the most highly skilled, and enjoy the highest standard of living, of any section of the industry throughout the world.

[1] Both duties were originally 5% in 1894.

In the Report (1909) by the Board of Trade in England into the Earnings and Hours of Labour of workpeople in the Textile Trades in 1906 (Cd. 4545) the average wages earned in the cotton trade for a full working-week were given as follows:—

Men.	Lads and Boys.	Women.	Girls.	All Workpeople.
26s 9d	11s 6d	18s 8d	10s 1d	19s 7d

The total wages bill for a full week at that time was £512,000 and the total number of operatives employed 523,030. It was also calculated that in 1906 the average annual earnings per head in the cotton trade were about £48. The number of hours constituting a full working-week at that time was 55½. Wages in the cotton trade in the United Kingdom are calculated on the basis of certain standard lists, the chief of which are known as the Bolton List and the Oldham List for cotton-spinning, and the Uniform List for cotton-weaving. In 1906 the wages actually paid were 5% above list prices for the Bolton and Oldham Lists and list prices for the Uniform List. Table G shows the changes since that date:—

Capital.—Much attention was attracted to the great movement in 1919–20 for the recapitalization of the British industry, which was to some extent inevitable. Owing to the demand for machinery and the high cost of production during the war, the book values of the mills represented only a fraction of the actual market value to which they had risen. The process of writing up the nominal capital of the companies to something approaching the actual market value of the plant was in itself harmless; but when the inevitable reaction came, those who had invested in the industry at the top of the wave seemed likely in 1921 to find it difficult to secure a normal rate of dividend on what had come again to be regarded as inflated values. The table on next page, founded upon Mr. F. W. Tattersall's list of 100 typical joint-stock companies in the Lancashire industry, gives an interesting indication of the earnings of the trade.

It is obvious that the later dividends, and especially in 1919–20, were extraordinarily high, even after allowing for Excess Profits Duty, but in 1921 the reaction was in full swing.

Cotton-seed.—Since 1910 a great change has come over the relative position of cotton-seed among the innumerable commodities which contribute to the supply of the vegetable and animal oils and fats. Until then oils were classified pretty rigorously, on the one hand as soft and hard, and on the other as edible and non-edible. Soft or liquid oils, such as linseed,

In Asia the chief crops before the war, apart from India, were in China and Asiatic Russia, including Transcaucasia. Statistically, the Chinese crop has always been a mystery, and its amount can only be guessed at about two million bales. The Russian crop had before the war risen rapidly to nearly 1½ million bales, part of which was of indigenous varieties similar to the Indian, and the remainder of good American quality; but this crop had been almost wiped out by the war, and it was not likely to recover as long as Russia remained in chaos.

The Cotton Industry.—The growth of the cotton industry throughout the world has already been indicated by the figures of spindleage given in the appended tables. Perhaps the most interesting feature up to 1921 had been the development of the American, Japanese and Indian sections of the trade. The first was largely due to the growth of the Southern mills, which had increased from ten million spindles in 1910 to 15 millions in 1920. In Japan the percentage increase of spindles had probably been greater than in any other country, though the total in 1921 was still comparatively small. The output of the Indian mills had also advanced in recent years, both in quality and quantity; but this unfortunately raised bitter controversy with regard to the Excise duties, which were imposed on the product of Indian mills in 1896 to balance the 3½% Customs duty[1] imposed for Revenue purposes on cotton goods imported into India. In 1917 the import duty was raised to 7½% without a corresponding increase in the Excise duty; and in 1921 the differentiation was still further increased by an addition of 3½% to the import duty. Table D shows the growth of the Indian cotton industry since 1911.

The facts with regard to the foreign trade of Great Britain in cotton and cotton goods are shown in Table E (See p. 769).

Number of Operatives.—In Table F are given the latest figures obtainable in 1921 as to the number of British operatives engaged in the cotton trade since the date of the Census of Production in 1907:—

TABLE F.—*Numbers employed (in thousands).*

Date.	Males.	Females.	Total.
1907	218	359	577
July 1914	274	415	689
Nov. 1918	144	349	493
July 1920	218	396	614
Nov. 1920	211	376	587

The controversial question of the employment of half-timers in the trade moved a step forward in England by the Education Act of 1918, which provided for their gradual abolition.

Wages.—With regard to wages, the outstanding feature of the British cotton industry was for many years the excellent organization both of masters and men, as the result of which wage disputes in the trade have, ever since the famous Brooklands Agreement of 1893, been reduced to a minimum. It is perhaps also due to this organization that, as a class, the cotton operatives of Lancashire are the most highly skilled, and enjoy the highest standard of living, of any section of the industry throughout the world.

[1] Both duties were originally 5% in 1894.

In the Report (1909) by the Board of Trade in England into the Earnings and Hours of Labour of workpeople in the Textile Trades in 1906 (Cd. 4545) the average wages earned in the cotton trade for a full working-week were given as follows:—

Men.	Lads and Boys.	Women.	Girls.	All Workpeople.
26s 9d	11s 6d	18s 8d	10s 1d	19s 7d

The total wages bill for a full week at that time was £512,000 and the total number of operatives employed 523,030. It was also calculated that in 1906 the average annual earnings per head in the cotton trade were about £48. The number of hours constituting a full working-week at that time was 55½. Wages in the cotton trade in the United Kingdom are calculated on the basis of certain standard lists, the chief of which are known as the Bolton List and the Oldham List for cotton-spinning, and the Uniform List for cotton-weaving. In 1906 the wages actually paid were 5% above list prices for the Bolton and Oldham Lists and list prices for the Uniform List. Table G shows the changes since that date:—

1910. In 1894 he was created a baronet, and in 1910 was raised to the peerage. He was in 1917 made president of the Air Board, and the same year was created a viscount. He was elected Lord Rector of Aberdeen University in 1918.

COX, JAMES MIDDLETON (1870–), American politician, was born near Jacksonburg, O., March 31 1870. He was educated in the common schools, worked in a newspaper office, for a short time was a country school teacher, and later became a reporter on the Cincinnati *Enquirer*. Afterwards he went to Washington as secretary to Congressman Paul Sorg, of Ohio. On the latter's retirement he decided to enter again the newspaper field. In 1898 he purchased the Dayton *News* and five years later the Springfield *Press-Republic*, subsequently named the *Daily News*, these papers being known thereafter as the Newspaper League of Ohio. From 1909 to 1913 he was a member of Congress from the Dayton district and served on the Appropriations Committee. He was an active opponent of the Payne-Aldrich tariff measure. He was elected governor of Ohio for the term 1913–15, was defeated for the following term, then was reëlected twice in succession (1917–21). At the time of his third election he was the only Democrat to be returned to state office, even the lieutenant-governor being Republican, and two-thirds of the congressional districts went Republican. In 1916 he was delegate-at-large to the Democratic National Convention. His career as governor was notable. Among the many reforms introduced under his guidance were a workmen's compensation law; a survey of occupational diseases with recommendations for health insurance; the elimination of the sweatshop; the establishment of a state industrial commission for dealing with questions of labour and capital; the provision of a minimum wage and a nine-hour day for women; mothers' pensions; ratification of the proposed woman suffrage amendment; the budget system for state expenditures; pure food laws; a "blue sky" law for protecting investors from unscrupulous promoters; the initiative and referendum; a Corrupt Practices Act; the indeterminate sentence for convicts; improvement of rural schools; the establishment of a state tuberculosis hospital and the extension of safety devices on railways and in mines. Many of these reforms were followed as models by other states. He was energetic in suppressing violence in connexion with strikes, his general policy being to hold local authorities responsible without recourse to the state militia. In at least one case he removed a mayor who had called for state troops. He favoured abolishing the Federal inheritance tax, believing that the state alone should have jurisdiction over inheritances. He opposed the excess profits tax but maintained that a small tax should be laid "on the volume of business of a going concern." He was a strong supporter of President Wilson's policies and especially of the League of Nations. He was often charged with opposing prohibition but repeatedly declared that all laws must be enforced. At the Democratic National Convention in 1920 he had from the beginning strong support for the presidential nomination. On the first ballot he stood third (with 134 votes); on the seventh ballot second (with 295½ votes); on the twelfth ballot first (with 404 votes); on the thirtieth ballot he dropped to second (with 400½ votes); on the thirty-ninth vote he again stood first (with 468½ votes); and continued to gain thereafter until he was nominated on the forty-fourth ballot. Following his nomination he "stumped" the country, making the League of Nations the prominent issue but was overwhelmingly defeated by Warren G. Harding, the Republican nominee. The electoral vote was 404 for Harding and 127 for Cox. The popular vote was 16,138,000 for Harding and 9,142,000 for Cox. The vote in Ohio, the home state of both candidates, was 1,182,000 for Harding and 780,000 for Cox. The magnitude of the defeat, unprecedented in American history, was generally considered as due in part to the unwarranted character of the charges made by Cox himself during the campaign, but chiefly to a widespread revolt against the recent course of President Wilson, whose policies Cox upheld.

COX, KENYON (1856–1919), American painter (*see* 7.353), died in New York, March 17 1919. In 1910 he was awarded the medal of honour for mural painting by the Architectural League. In 1911 he published *The Classic Point of View*, being lectures delivered that year before the Chicago Art Institute. Other works are *Artist and Public* (1914, largely reprints from periodicals); *Winslow Homer* (1914) and *Concerning Painting* (1917).

COZENS-HARDY, HERBERT HARDY COZENS-HARDY, 1st Baron (1838–1920), English lawyer and Master of the Rolls, was born at Letheringsett Hall, Dereham, Norfolk, Nov. 22 1838, the son of William Cozens-Hardy, a Nonconformist solicitor in large practice at Norwich. He was educated at Amersham school and afterwards at London University, where he took his degree in 1858. He was called to the bar in 1862, and built up a large and very successful connexion, chiefly in Nonconformist and Liberal circles. He became a Q.C. in 1882, and was raised to the bench in 1899. In 1885 he was returned as Liberal member for Norfolk, retaining the seat until 1899. In 1901 he was made a lord of appeal, and in 1907 Master of the Rolls. In August 1913 he was appointed one of the three commissioners of the great seal during the absence of Lord Chancellor Haldane in Canada. In 1914 he was raised to the peerage, and in 1918 resigned the office of Master of the Rolls, being succeeded by Lord Swinfen. He died at Letheringsett Hall June 18 1920.

CRACKANTHORPE, MONTAGU HUGHES (1832–1913), English lawyer, was born at Nowers, Som., Feb. 24 1832, the son of Christopher Cookson of Nowers. The name of Crackanthorpe was assumed by him in 1888 on succeeding to the estate of Newbiggin, Westmoreland. He was educated at Merchant Taylors' school and St. John's College, Oxford, when he took his degree in classics in 1854, winning the Eldon law and University mathematical scholarships. He was called to the bar in 1859, and soon became well known not only as a barrister but as a keen student of criminology. He became a Q.C. in 1875, and from 1893 to 1899 was standing counsel to Oxford University. He took much interest in eugenics, and was president of the Eugenics Education Society from 1909 to 1911. He published *Population and Progress* (1907). He died in London Nov. 16 1913.

CRADOCK, SIR CHRISTOPHER GEORGE FRANCIS MAURICE (1862–1914), British admiral, was born at Hartforth, Yorks., July 2 1862, the son of Christopher Cradock. He entered the navy at the age of 13 and saw service in Egypt both in 1882 and again in the Soudanese expedition of 1891. He commanded the British Naval Brigade at the capture of the Taku forts and the relief of Peking (1900). He more than once performed personal feats of gallantry in saving life at sea and showed himself a bold and fearless leader in action. He was promoted captain after Taku, and rear-admiral in 1910. In 1912 he was granted the K.C.V.O. He published *Sporting Notes in the Far East* (1889); *Wrinkles in Seamanship* (1894) and *Whispers from the Fleet* (1907). Early in the World War he was given command of a British squadron in the Pacific consisting of the cruisers "Good Hope" (flagship) and "Monmouth," the armed merchantman "Otranto" and the light cruiser "Glasgow." His squadron was attacked off the coast of Chile (Nov. 1 1914) by five German warships, the "Scharnhorst," "Gneisenau," "Leipzig," "Dresden" and "Nürnberg." Though inferior in speed and gunpower he decided to attack. The "Monmouth" was sunk and the "Good Hope" was blown up whilst making for shore, Admiral Cradock going down with the ship.

CRAM, RALPH ADAMS (1863–), American architect, was born at Hampton Falls, N.H., Dec. 16 1863. He was educated at the Westford (Mass.) Academy and the Exeter (N.H.) high school. He studied architecture in a Boston office, was for a time art critic on the *Boston Transcript* and in 1889 opened an architect's office in Boston. He had a profound knowledge of mediaeval architecture and was an able advocate of the Gothic style, employed by him in many church and college buildings. Examples of his successful ecclesiastical work include St. Thomas's church, New York; Calvary church, Pittsburgh; St. Paul's cathedral, Detroit; the Fourth Presbyterian church, Chicago; and St. Alban's cathedral, Toronto. He was consulting architect for the cathedral of St. John the Divine, New York. He designed buildings for the Princeton graduate school, Sweet Briar College

(*Va.*), the *Rice Institute* (Texas), Williams College, Williamstown, Mass., and Phillips Academy at Exeter, N.H. In 1903 his plans were accepted for remodelling the U.S. Military Academy. In 1914 he was appointed professor of Architecture at the Massachusetts Institute of Technology.

His numerous writings include *Church Building* (1901); *The Ruined Abbeys of Great Britain* (1905); *Impressions of Japanese Architecture and the Allied Arts* (1906); the *Gothic Quest* (1907); *The Ministry of Art* (1914); *Heart of Europe* (1915); *The Substance of Gothic* (1916, Lowell lectures); *The Nemesis of Mediocrity* (1918); *The Great Thousand Years* (1918); *The Sins of the Fathers* (1919); *Walled Towns* (1919) and *Gold, Frankincense, and Myrrh* (1919).

CRAMP, CHARLES HENRY (1828–1913), American shipbuilder (*see* 7.363), died in Philadelphia June 6 1913.

CRAMP, CONCEMORE THOMAS (1876–), British Labour politician, was born at Staplehurst, Kent, on March 19 1876. He left school at the age of 12, and worked as a boy gardener to the local squire. At the age of 18 he left his native village and obtained employment as a gardener outside Portsmouth. In 1896 at the age of 21 he joined the service of the Midland Railway at Shipley, near Bradford, as a porter at 16s. a week of seven days of 12 hours each. He was later transferred to Masboro', then to Sheffield, and promoted to a passenger guard. He joined the Amalgamated Society of Railway Servants and first appeared as a delegate at its Birmingham all grades conference, 1907. Later he became delegate to the annual general meeting of the A.S.R.S. and in 1911 was elected to represent his district on the executive committee. He was elected president of the National Union of Railwaymen at the 1917 annual general meeting. During the World War he became a member of several Government committees including the Port and Transit Executive Committee, Committee on Adult Education, Consumers' Council, and Railway Advisory Committee. He stood for Parliament unsuccessfully as Labour candidate for Middlesborough at the general election in 1918. He was appointed Industrial General Secretary of the National Union of Railwaymen on Jan. 1 1920 and became a member of the Executive Committee of the Labour party.

CRANE, WALTER (1845–1915), English artist (*see* 7.366), died at Horsham March 14 1915.

CRAWFORD AND BALCARRES, 26TH EARL OF (1847–1913), British astronomer and orientalist (*see* 7.385), died in London Jan. 31 1913. He was succeeded as 27th earl by his son David Alexander Edward Lindsay (b. 1871), well known under his former title of Lord Balcarres as an art critic and connoisseur. He was appointed a trustee of the National Portrait Gallery, and has published *Donatello* (1903), and *The Evolution of Italian Sculpture* (1910). In 1916 he was included in Mr. Lloyd George's Cabinet as President of the Board of Agriculture and in 1921 became Lord President of the Council.

CREWE, ROBERT OFFLEY ASHBURTON CREWE-MILNES, 1ST MARQUESS OF, English statesman and writer (*see* 7.432), remained leader of the House of Lords through Mr. Asquith's first administration, and during the Coalition Government of 1915–6. Though he was not Lord Granville's equal in the difficult and delicate task of endeavouring to win the peers' assent to a succession of unpalatable measures of Radical reform, he contrived, by his courtesy and charm, to retain their liking and respect throughout the critical period beginning with the budget of 1909. He succeeded Lord Morley at the India Office in Nov. 1910, and attended, as Secretary of State, the King and Queen on their visit to India in the winter of 1911–2. He was responsible for the high acts of policy announced at the Delhi Durbar; the removal of the capital of India from Calcutta to Delhi, and the reunion of the two Bengals under a Governor-in-Council. At the coronation of King George he was promoted to a marquessate. In the first Coalition Government he was Lord President of the Council. He followed Mr. Asquith in declining to take office under Mr. Lloyd George; and after his resignation he continued to lead the independent Liberal opposition in the Lords.

CRICKET: *see* SPORTS AND GAMES.

CRILE, GEORGE WASHINGTON (1864–), American surgeon, was born at Chili, O., Nov. 11 1864. After graduating from Ohio Northern University (1884), he studied medicine at Wooster University (M.D. 1887) and later at Vienna, London and Paris. He taught at Wooster from 1889 to 1900. He was professor of Clinical Medicine at Western Reserve University from 1900 to 1911, and was then made professor of Surgery. During the Spanish-American War he was made a member of the Medical Reserve Corps and served in Porto Rico (1898). He was made an hon. F.R.C.S. (London) in 1913. After America entered the World War he became major in the medical O.T.C., and professional director (1917–8). He served with the B.E.F. in France and was senior consultant in surgical research (1918–9). He was made lieutenant-colonel in June 1918 and colonel later in the year. He made important contributions to the study of blood pressure and of shock in operations. Realizing that any strong emotion, such as fear before operation, produced shock, he attempted to allay dread by psychic suggestion, also endeavouring to prevent the subjective shock which affects the patient, even when under general anaesthesia, by first anaesthetizing the operative region with cocaine for several days, if necessary, before operating. Thus nerve communication between the affected part and the brain was already obstructed when the general anaesthetic was administered (see *Anoci-Association*, 1914, with Dr. Wm. E. Lower). For his work in shockless surgery he received a gold medal from the National Institute of Social Sciences in 1914.

Among his works are: *Surgical Shock* (1897); *On the Blood Pressure in Surgery* (1903); *Hemorrhage and Transfusion* (1909); *Surgical Anemia and Resuscitation* (1914); *The Origin and Nature of the Emotions* (1915); *Man an Adaptive Mechanism* (1916); *A Mechanistic View of War and Peace* (1916) and *The Fallacy of the German State Philosophy* (1918).

CROCE, BENEDETTO (1866–), Italian philosopher and statesman, was born at Pescasseroli, in the province of Aquila, Italy, Feb. 25 1866. He came of a family that counted among its members several jurists and magistrates. Born in the part of Italy formerly known as Greater Greece, it may be said of him without paradox that the development of his mind and character represented a modern incarnation of all that was subtle and profound in the Hellenic genius, linked with the best and wisest tradition of Roman civilization and of the Christianity that came to take its place. From the remote township of his birth, however, the branch of the family to which the philosopher belonged transferred itself soon afterwards to Naples, so that, like his predecessor Vico, Benedetto Croce may be correctly described as a Neapolitan. He studied at Rome and in Naples, afterwards adopting the life of an independent student and occupying himself especially with literary and with Neapolitan history. Much of his work that bears upon that period of youth is to be found in the volumes: *La Rivoluzione Napoletana del 1799; Saggi sulla letteratura italiana del Seicento; La Spagna nella vita italiana durante la rinascenza; Storie e leggende napoletane.* But Croce did not altogether neglect philosophy at this period. Towards his thirtieth year the study of philosophy and of history together occupied most of his attention. His principal works are contained in four volumes comprised under the general title *Filosofia dello spirito:* (1) *Estetica come scienza dell' espressione e linguistica generale,* (2) *Logica come scienza del concetto puro,* (3) *Filosofia della practica: economia ed etica* and (4) *Teoria e storia della storiografia.* These were published between 1902 and 1913. With these may be mentioned certain volumes of essays, among which are to be noted those upon *Historical Materialism and Marxist Economy* (1896–1900); upon *Hegel* (1905); upon *Vico* (1910); and the *New Essays upon Aesthetic* (1920), which complete and carry further the first *Aesthetic.*

Croce only took part in the administrative work of Naples upon rare occasions and in moments of crisis. During the World War he developed a polemic directed against democratic-humanitarian conceptions and particularly those of President

Wilson, whose influence on the peace settlement was regarded by him as injurious to Italy. His writings on this subject have been collected in a volume entitled *Pagine sulla guerra* (Naples, 1919). In June 1920, when the Giolitti Government was formed with the programme of a reconstitution of the Italian State and of radical reforms, Croce (who had been a senator of the Kingdom of Italy since 1920) was asked to accept the office of Minister of Public Instruction. He agreed conditionally upon his programme being carried out. This programme was based upon the idea of a liberal reconstruction: he aimed at the reduction and simplification of the State schools combined with a more rigorous method of teaching, and at affording all facilities to, and indeed inviting the competition of, private instruction, fearless of the confessional school, which in his view would be compelled to modernize itself in order to maintain competition with the State school. In 1921 he retired from office on the resignation of the Giolitti Ministry.

It may be said of the philosophy of Benedetto Croce that it has formulated the truth of the unity of the spirit in the form most acceptable to the Western world. Its fundamental motive is the serious consideration, in a continuous and concrete manner, of that union of philosophy and history which had been glimpsed by earlier thinkers, but had hitherto been pursued in a manner more or less capricious. For Croce, the only knowledge is knowledge of the history, in its widest sense, both of men and of what is called nature, or the history of the spirit. This knowledge, however, is by no means positivistic or empirical, but on the contrary it is dialectical and *a priori* synthetic, brought about by the spiritual categories; and from it there constantly arise new problems, an ever new position of the fundamental categories. The treatment and solution of these problems is what is called "philosophy" in the strict sense of the word, which for that reason coincides with methodology speculatively understood. In the treatment of the spiritual categories, Croce laid special stress upon those which had been least elaborated and least studied.

A vivid new light is shed by him upon certain problems, such for instance as those of the imagination or intuition, the source of Art and the theme of the *Aesthetic*, upon pure will, the source of Economic of Rights and of Politics, treated by *Economic*. The more precise determination and configuration of the categories and their mode of acting, by means of which is negated and solved the concept of an external reality and of nature placed outside the spirit and opposed to it, led Croce to an absolute spiritualism, widely different from the pan-logicism of Hegel and his school, which only seemed to solve the dualism of spirit and nature and really opened the door to the notion of a transcendental God, as became clear in the development of Hegel's theory at the hands of the right wing of his school. In the *Philosophy of the Practical*, but more especially in the work entitled *What is living and what is dead of the Philosophy of Hegel* Croce criticizes the erroneous treatment of the opposites, and shows that on the contrary every opposition has at bottom a distinction from which it arises, and that therefore the true unity is unity-distinction, which is development and, as such, opposition that is continuously surpassed and continually re-appearing to be again surpassed. Another important conception connected with the preceding is the infinity of philosophy, which arises out of history and is as it were a reflection from history, varying at every moment and always solving a problem by placing alongside its solution the premise of a new history and therefore of a new problem and a new philosophy. Croce's substitutes for the old formula "system" the new formula "systematization." He thus admits that to philosophize is to systematize, but holds that every systematization is narrowly circumscribed, and is therefore to be solved and completed with ever new systematization. Thus scepticism and relativism are superseded by a historical philosophy, and the *absoluteness* of truth is affirmed, but the notion of a *definite* truth is at the same time both negated and satirized.

The philosophers from whom Croce learned most are Vico, the author of the *Scienza nuova*, and Hegel, but the thought of all other thinkers flows in his writings, in conformity with its historical character, and for this reason may, for instance, be found in it traces of some of Hegel's most active opponents, such as Herbart.

But the origin of the philosophy of Croce is the need, so keenly felt in our time, of a philosophy that shall be both realistic and idealistic, in which the fact will not drive out thought and thought will not go beyond the fact: in short, of a philosophy of immanence. The religious feature of this philosophy, against which has often been brought the accusation of excluding religion, resides in the consciousness of the unity of all and of the perpetual creation of the world by the spirit, as though it were a poem that the spirit is eternally composing, to which each individual contributes his strophe, or it may be only his line or his word: this poem has its end in itself and in its rhythm has beauty and joy, as well as labour and sorrow. This conception sets us free from the antithesis of optimism and pessimism.

Croce has elaborated the various philosophic sciences in treating of the various theories to which they give rise, and he has completed the doctrines with their history, either, as in the case of the *Aesthetic*, with a masterly historical survey of previous speculation on the subject, or in a more modest form in appendices. It is only possible to allude briefly here to the different conclusions that he has attained in treating the various problems, as for example in *Aesthetic*, the unity of art and language, of intuition and expression, the negation of particular arts, the refutation of literary and artistic classes, the criticism of rhetoric, of grammar and so forth; and in the *Philosophy of the Practical* or of Practice, the conciliation of the antitheses of utilitarianism and moralism, the critique of precepts, of laws and of casuistry, the new conception of judgments of value, the constitution of a philosophic economy side by side with the science of Economy, the resolution of the Philosophy of rights in the Philosophy of economic, and so forth. It is important to note that in conceiving philosophic studies to be all one with historical studies and attaining to this unity in himself, he cultivated historical studies to an equal extent with purely theoretical and speculative studies, concentrating especially upon the history of thought and poetry. Among his principal works upon these subjects may be noted the four volumes of *Letteratura della nuova Italia* (1860–1910); his essays upon *Goethe*, *Ariosto*, *Shakespeare*, *Corneille*, and the *Poetry of Dante*; his two volumes *Storia della storiografia italiana del secolo XIX* and the collection of essays entitled *Una famiglia di patrioti*.

Croce, occupied with such studies as those mentioned, also found time to edit numerous texts and miscellaneous collections and composed many bibliographies, in addition to editing the *Critica*, in many respects the profoundest and widest in scope of all the European literary and philosophical reviews. In the work of this review his chief collaborator was Giovanni Gentile, but Croce contributed most of the literary and much of the philosophic criticisms.

The works of Croce have been translated into many languages. Douglas Ainslie was the first in Great Britain to draw attention to his importance as one of the leaders of European thought, and made him known in many articles and lectures both in Great Britain and in America. He also translated and published the complete *Philosophy of the Spirit* in four volumes (the *Aesthetic*, the *Logic*, the *Practical*, with Macmillan; the *Theory and History of Historiography*, with Harrap). The work on Vico has been translated by R. G. Collingwood, and that on *Historical Materialism and Marxism* by C. M. Meredith, the *What is living and what is dead of the Philosophy of Hegel* (Macmillan), and the *Breviary of Aesthetic* (Rice Institute, Texas), the volume *Shakespeare, Ariosto and Corneille* (Henry Holt & Co., New York), and the *Poetry of Dante* by Douglas Ainslie.

Among the numerous studies of Croce may be mentioned Dr. H. Wildon Carr's work *The Philosophy of Benedetto Croce* (Macmillan), and the further development of the same in his essay *Time and History*, where will be found a parallel and a distinction between Croce and Bergson (*Proceedings of the British Academy*, vol. viii.); and the very full and complete bibliography by G. Castellano, *Introduzione allo studio delle opere di B. Croce: Note bibliografiche e critiche* (Bari, Laterza, 1920).

Croce has himself composed a mental autobiography: *Contributo alla critica di me stesso* (Naples, 1918, limited to one hundred numbered copies for private circulation), and also a brief history of his native place and of his family (*Montenerodomo, storia di un comune e di due famiglie*, Bari, 1919), and another opuscule upon the house in which he lives: *Un angolo di Napoli* (Naples, 1912).

(D. A.; G. C.)

CROCKETT, SAMUEL RUTHERFORD (1860–1914), Scottish novelist (*see* 7.477), died at Avignon April 20 1914.

CROMARTY (*see* 7.483).—Before the outbreak of the World War the Cromarty Firth was surveyed as an advanced base for the main battle fleet in the event of a war with Germany, and the erection of defences at Cromarty was begun in 1912 and had made considerable progress by the outbreak of war. When the war began, Scapa Flow (*see* SCAPA FLOW) was adopted as the chief naval base because of the more restricted space of the Cromarty Firth and in view of the unsuitability of the narrow single entrance to the firth for sweeps into the North Sea and for the guarding of the northern exits. The existence of an anti-submarine defence made Cromarty important in the early months of the war. It was used throughout the war as a coaling station and was one of the nine "Trawler Stations" under the control of the Admiral of Patrols. Cruiser squadrons, with their destroyer flotillas, used Cromarty as their base, and it was from Cromarty that the "Invincible" and "Inflexible" started for the battle of the Falklands. One of the most serious naval disasters of the war occurred in the harbour of Cromarty on Dec. 30 1915, when the armoured cruiser "Natal" was destroyed by an accidental explosion.

CROMER, EVELYN BARING, 1ST EARL OF (1841-1917), British statesman and diplomatist (*see* 7.484). Lord Cromer's life was prolonged for nearly ten years after his return from Egypt; and, in spite of enfeebled health, culminating in a serious illness in 1914 from which he never completely recovered, he took an important share in political, social and literary movements at home. He was constant in his attendance in the House of Lords, and indefatigable in the work of its committees; he was a leading member of the free trade section of the Unionist party; he was active in opposition to female suffrage, and in combating anti-vivisection propaganda. Besides publishing his two volumes of *Modern Egypt*, he composed several addresses and pamphlets, wrote frequently for the periodicals, and from 1912 onwards was a regular contributor of signed articles and reviews of books to the *Spectator*—his vigorous and informed writing becoming an attractive feature of the paper. When the British Protectorate of Egypt was proclaimed, he completed his history of the modern development of that country in a small volume entitled *Abbas II.*, containing matter which it would have been indiscreet to publish so long as Abbas remained Khedive. While he was forward in promoting the study of Oriental languages, his strongest affection was for the Greek and Latin classics with which he had only become acquainted in mature life; he became president of the Classical Society, and endowed a Greek prize for the British Academy. In the critical period of which the main features were the budget of 1909 and the Parliament bill of 1911, Lord Cromer played an energetic part. He failed to prevent the rejection of the budget by the House of Lords; but he was successful in his untiring efforts to persuade moderate Unionist and cross-bench peers to counter the "Die-hard" movement, and to vote for the Parliament bill rather than force the Government to swamp the House by an unlimited creation. It was in the performance of another patriotic duty, during the World War, that he met his death. In spite of age and indifferent health he accepted the laborious and invidious task of chairman of the special commission to inquire into the abortive Dardanelles operations. The sittings occupied the autumn of 1916, and while engaged on the draft report he was seized in Dec. with an attack of influenza. Before he had recovered, he resumed the work of the commission, which completely broke him down. He died a few weeks after the beginning of the new year. Seldom has there been a life more singly and successfully devoted to the good of his country.

See Lord Sanderson's *Memoir of Evelyn, Earl of Cromer* (1917).
(G. E. B.)

CRONJE, PIET ARNOLDUS (1840-1911), Boer general (*see* 7.501), died at Klerksdorp, Transvaal, Feb. 4 1911.

CROOKES, SIR WILLIAM (1832-1919), English chemist and physicist (*see* 7.501), died in London April 4 1919. He was given the O.M. in 1910.

CROOKS, WILLIAM (1852-1921), British Labour politician, was born at Poplar April 6 1852. After spending his early years in the workhouse of which he afterwards became chairman of the Board of Guardians, he started work at the age of 14 as a cooper's apprentice, and soon became an ardent trade unionist. His long career of public work began in 1882, when he was made trustee of the parish of Poplar and Library Commissioner. In 1892 he became a member of the L.C.C., on which he worked continuously for 28 years. From 1898 to 1906 he was chairman of the Poplar Board of Guardians, and in 1901 mayor of Poplar. In 1903 he entered Parliament for Woolwich, and, except for one short interval in 1910, continued to represent that constituency until his resignation in 1921. On the outbreak of the World War he entered wholeheartedly into the work of recruiting and in 1916 he was made a Privy Councillor. Continued ill-health compelled his retirement from politics in Feb. 1921, and he died in Poplar hospital on June 5 1921.

CROTHERS, SAMUEL McCHORD (1857-), American clergyman and author, was born at Oswego, Ill., June 7 1857. He was educated at Princeton (A.B. 1874), Union Theological Seminary (1874-7), and the Harvard Divinity School (1881-2). Ordained as a Presbyterian minister in 1877 he was a pastor in Nebraska, Nevada, and California (1877-81). He became a Unitarian minister in 1882, called to Brattleboro, Vt. (1882-6), St. Paul, Minn. (1886-94), and Cambridge, Mass. (since 1894). An inspiring preacher and a very popular public speaker, he won a still wider audience by his essays, which recall the quaint humour of Charles Lamb.

Among his best known volumes are:—*The Gentle Reader* (1903); *The Understanding Heart* (1903); *The Pardoner's Wallet* (1905); *The Endless Life* (1905); *By the Christmas Fire* (1908); *Oliver Wendell Holmes and His Fellow Boarders* (1909); *Among Friends* (1910); *Humanly Speaking* (1912); *Three Lords of Destiny* (1913); *Meditations on Votes for Women* (1914) and *Pleasures of an Absentee Landlord* (1916).

CROWDER, ENOCH HERBERT (1859-), American soldier, was born in Missouri April 11 1859. He graduated from the U.S. Military Academy in 1881 and while detailed as commandant at the university of Missouri won in 1886 the degree of LL.B. in the law school. He was appointed major judge-advocate in 1895. He served in the Philippine Islands (1898-1901), was observer with the Japanese army in Manchuria (1904-5), and was in Cuba as Secretary of State and Justice (1906-8). He was provost-marshal general from May 1917 to July 1919, and as such had full control of the U.S. machinery of conscription in the World War, which he conducted witn much success. He was reappointed judge-advocate general in 1919, and the same year invited by the Government of Cuba to advise in connexion with changes in the election legislation there. General Crowder was recognized as an exceptionally authoritative legal adviser in military affairs. In his book *The Spirit of the Selective Service* (1920), he described the method whereby within 18 months after America had entered the World War 2,000,000 men were in France, almost as many more were in cantonments, and altogether no fewer than 24,000,000 had been registered and classified.

CROZIER, JOHN BAPTIST (1853-1920), Protestant Archbishop of Armagh, was born at Ballyhaise, co. Cavan, Ireland, April 8 1853. After a distinguished career at Trinity College, Dublin, where he took his degree in 1872, he was ordained in 1876. From 1885 to 1897 he was vicar of Holywood, co. Down. In 1896 he became honourable secretary of the General Synod of the Church of Ireland, becoming in the same year a canon of St. Patrick's cathedral. In 1897 he was elected Bishop of Ossory, was translated in 1907 to the see of Down, and in 1911 succeeded Dr. Alexander as Archbishop of Armagh and Primate of All Ireland. In 1912 he took a conspicuous part in the agitation against the Home Rule bill, and presided over the monster meeting of Unionists held at Balmoral, Belfast, on Easter Tuesday. In the Irish Convention of 1917-8, he and Dr. J. H. Bernard (then Archbishop of Dublin), represented the Church of Ireland. At the close of the Convention the Archbishop joined Dr. Mahaffy, the provost of Trinity, in presenting a minority report advocating a solution of the Irish question on the lines of the Swiss federalism. He died at Armagh April 1 1920.

CROZIER, JOHN BEATTIE (1849-1921), British philosopher, was born at Galt, Can., of Scottish parentage April 23 1840. He was educated at the local grammar school, where he won a scholarship to Toronto University, which he was, however, obliged soon to surrender owing to ill-health. He returned to the university four years later and took a course in medicine, graduating in 1872. He then came to England, bought a practice in London, and began a systematic study of philosophy and economics. His first publication, *The Religion of the Future* (1880), attracted little attention; but *Civilization and Progress* (1885) reached a 4th edition and was translated into Japanese. His *History of Intellectual Development* (1897-1901) was followed by the grant of a Civil List pension, some compensation for failing eyesight and the loss of his medical practice. His further publications included *My Inner Life*, an autobiography (1898); *The Wheel of Wealth* (1906); *Sociology applied to Practical Politics* (1911) and *Last Words on Great Issues* (1917). He died in London Jan. 8 1921.

CROZIER, WILLIAM (1855–), American soldier (*see* 7.520), was detailed in 1912 as president of the Army War College and the following year was reappointed chief of ordnance with the rank of brigadier-general. He was made major-general, chief of ordnance, U.S.A., in 1917, and the provision of munitions in the World War was under his charge until Dec. 1917. He was then made a member of the War Council, and in the discharge of this office was in France and Italy for the first half of 1918. For the remainder of the year he was commandant of the N.E. Department, U.S.A., retiring from active service in December.

CRYSTALLOGRAPHY (*see* 7.569).—The geometry of the external forms of crystals may be said to have been completely worked out. The 32 crystal-classes differing from one another in their type and degree of symmetry and the six crystal-systems into which these classes can be grouped are now well established. The same is also true of the geometrical conceptions of the internal structure of crystals (though a good general account is still wanting). It is known that there are 230 possible types of homogeneous point-systems and that these are referable to 14 kinds of space-lattices. Recent work has been in the direction of attempting to trace a connexion between the internal structure of crystals and their chemical constitution. Here there is ample scope for speculation; but since 1912, when X rays provided a new method of investigation, some real advance has been made. By this method it is possible not only to determine the internal structure of crystals, but also actually to measure the distance between the atoms.

Crystals consist of a homogeneous assemblage of particles, and these particles are marshalled in certain definite ways. The grouping around any one particle (except those on the boundaries of the crystal) is the same as that around every other particle of the same kind. Further, the particles are arranged at regular intervals along straight lines. Throughout the structure there are several parallel sets of such lines, and these lie in several parallel sets of planes also at regular intervals apart.

An example of such a structure is the simple cubic space-lattice represented in fig. 1. Here the particles (all of the same kind) are placed at equal distances, say a, along parallel lines in three sets at right angles; the distance between the parallel lines in each plane and between the parallel planes of lines being also a. That is, the particles are situated at the points of intersection of a system of lines that form a square network or lattice in three dimensions. Or the structure may be regarded as a stack of small cubes each with a quarter of a particle at every corner; the four adjoining cubes at each corner then providing the whole particle. In this grouping, any one particle is surrounded by a set of 6 similar particles at distance a; further, it is surrounded by 12 particles at distance $\sqrt{2}a$ (*i.e.* the diagonal of the square); and by 8 other particles at distance $\sqrt{3}a$ (*i.e.* the diagonal of the cube).

It is clear from fig. 1 that the three sets of lines are parallel to the edges of the cube, and that they lie in planes parallel to the faces of the cube. But it is to be noticed that the particles also lie in other sets of parallel lines, and that these lines fall in other sets of parallel planes. Certain of these additional lines and planes of particles are represented more prominently in fig. 2, which is drawn on a smaller scale with a larger number of particles (but to avoid confusion only those on the surface of the solid are marked). In this figure the three front edges of a portion of the main cube are truncated by planes of the rhombic-dodecahedron, and one corner has been cut off symmetrically by a face of the octahedron. (Since the octahedron face intersects both the cube and the rhombic-dodecahedron faces, its outline is hexagonal.) It will be seen that the several layers of particles parallel to any one of these faces are continuous over the other faces, although the particles themselves are ranged along lines of different directions. Hundreds of different planes of particles can, in fact, be traced out in such a structure; and it is important to remember that these structure planes are parallel to possible external faces on the crystal. A close relation exists between the Millerian indices of these faces and the number of particles along certain lines in the corresponding planes. The dotted lines on the front cube face in fig. 2 represent the intersections or traces of such planes with the indices: (111), (211), (311), etc.; (221), (321), etc.; (331), (431), etc.; respectively for the lines from right to left. The seven planes of which the indices have just been given necessitate by symmetrical repetition the presence of 93 other structure planes, or, in all, 200 external crystal faces.

It will be further seen from a study of fig. 2 that the spacing between the particles is not the same on each of the faces (allowance being made for foreshortening in the drawing: only on the front cube face are the particles represented at their true distance apart). On the cube faces the distances each way are, of course, a. On the faces of the rhombic-dodecahedron they are spaced at distance a in one direction, but along the second direction at right angles at distance $\sqrt{2}a$. On the octahedral face there is, instead of a rectangular grouping, a triangular and hexagonal pattern with the particles spaced at distances $\sqrt{2}a$ in three directions. It follows therefore that the number of particles on each of the faces is not the same for equal areas. The network of particles is closer on the cube face than on the rhombic-dodecahedron, and more open on the octahedron. This "reticular density" of the different faces is a question of importance and is closely related to the cleavage of crystals. Minerals with cubic cleavage (*e.g.* rock-salt and galena) would be expected to be of this structure.

In addition to the spacing of the particles in the planes, there is also to be considered the distances between the planes themselves. This is represented in fig. 3 by means of vertical sections through the structure (fig. 2) perpendicular to the respective planes. In fig. 3a the spaces between the cube planes is, of course, a, and the particles are also spaced at distance a; the pattern being, in fact, that on a cube face perpendicular to the first. In fig. 3b the distance between the rhombic-dodecahedron planes is given by half the diagonal of the cube face, namely $a / \sqrt{2}$, and the particles are at distances a apart. Here, however, the section-plane intersects lines of particles only in alternate rhombic-dodecahedron planes. In fig. 3c the distance between octahedron planes is given by one-third the diagonal of the cube, namely $a / \sqrt{3}$; and the particles are at distance $\sqrt{6}a$ apart along the traces of the octahedron planes, though only at distances a or $\sqrt{2}a$ across these planes. (In figs. 3b and 3c the section-plane is the same, since it is perpendicular to both the rhombic-dodecahedron and the octahedron, and the particles intersected are also the same; but to avoid confusion in the drawing the two sets of planes are separated in the two figures.) Other section-planes could, of course, be drawn perpendicular to the planes in question, but, whilst the distances between the planes would be the same, the spacing of the particles would be different.

In addition to the simplest type of cubic lattice discussed in some detail above, there are two other types. The three are represented together for comparison in fig. 4. In fig. 4b there is an additional point at the centre of each cube—this may be called the centred cubic lattice; and in fig. 4c there are additional points at the centre of each face, giving the face-centred cubic lattice. The different relations afforded by these types need not be discussed here. But it may be pointed out that in the centred cubic lattice the greatest reticular density is in the rhombic-dodecahedron planes, whilst in the face-centred cubic lattice the particles are most closely packed in the octahedron planes. These would be expected to correspond to cubic crystals showing rhombic-dodecahedral and octahedral cleavage (*e.g.* zinc-blende and fluor-spar) respectively.

Types of lattices other than the cubic are deduced by varying the distances of the particles along the different axes and by varying the angles between these axes, in a manner similar to that in which the six crystal-systems are deduced. In fact the elements of the elementary cells of the lattice, namely the lengths and inclination of their edges, are identical (except in certain cases) with the parameters $a:b:c$ and the axial angles α, β and γ deduced from the external crystal faces.

The "particles" referred to above may be crystal molecules, chemical molecules, or even atoms. They are represented in the diagrams as spots without committing ourselves as to their shape or size (in relation to their distance apart). Some authors represent them as spheres in contact with one another, regarding these as the spheres of influence of each atom. If the spheres are of equal size, the number of points of contact and the closeness of the packing will vary with the type of lattice. Or again, we may regard the particles (all of the same size) as completely filling space. In this case the particles in the simple cubic lattice will be cubes, each in contact with six other cubes; in the centred cubic lattice they are cubo-octahedra with 14 surfaces of contact; and in the face-centred cubic lattice they are rhombic-dodecahedra with 12 surfaces of contact.

The above outline of the geometrical structure of crystals has been necessary for the purpose of introducing the new X-ray methods of investigating the internal structure of crystals.

X rays, or Röntgen rays, are propagated as waves in the same manner as rays of ordinary light, but they are of much smaller wave-length. The wave-length of yellow (sodium) light is 0·0000589 cm. (*i.e.* of the order 10^{-5} cm.), whilst the wave-lengths of X rays are of the order 10^{-8} or 10^{-9} cm., or one thousand to ten thousand times smaller. The very fine rulings of parallel lines (about 7,000 to a cm.) of diffraction gratings being of a magnitude (10^{-4} cm.) comparable with the wave-lengths of light, they produce well-known diffraction effects. It would be impossible to produce mechanically a grating which would

be fine enough to diffract the much shorter X rays. But it occurred to Dr. Max Laue, of Zurich, that the reticular structure of crystals would supply the necessary grating, since the distances between the atoms in the space-lattices are of the order 10^{-8} cm. When, in 1912, this idea was put to the test a very surprising result was obtained. Plates cut from crystals parallel to certain faces were placed perpendicularly in the path of a thin pencil of X rays, and beyond a photographic plate was exposed. The resulting photograph (known as a Laue photograph or radiogram, Röntgenogram or Röntgen pattern, or spot photograph) shows a larger central spot representing the direct rays, whilst surrounding it is a symmetrical pattern of smaller spots. The spots may also be shown directly by projection on a screen of fluorescent material. This pattern shows the same degree of symmetry as that on the crystal face. Thus a plate from a hexagonal crystal of beryl cut parallel to the basal plane (*i.e.* perpendicular to the principal axis) shows a six-fold arrangement of spots symmetrical about six radial lines at 30°; whilst when the plate is cut parallel to a prism face of the same crystal the spots are symmetrical about two lines at right angles. Fig. 5 is a reproduction of an actual photograph obtained by passing a pencil of X rays through a basal cleavage plate, 0·81 mm. in thickness, of the pseudo-rhombohedral chlorite, penninite. This photograph (after H. Haga and F. M. Jaeger, 1915) is selected on account of its comparative simplicity and the obvious three-fold arrangement of the spots.

The results obtained with these Laue photographs were at first explained as due to diffraction, but the problem is much more complex than diffraction by a single system of parallel lines in one plane, since we are here dealing with a lattice in three dimensions in which there are many series of lines in many planes. As explained by Sir William Bragg and his son Prof. W. L. Bragg in their book (*X-rays and Crystal Structure*, London, 1915; 3rd ed., 1918) it is due to the amplification of waves reflected from successive layers of atoms within the crystal. In fig. 6 a beam of X rays AB, $A'B'$, $A''B''$, all of the same wave-length λ, strikes at a glancing angle θ the planes of particles, the distances between which are d (cf. fig. 3). They are reflected by successive planes as a single ray BC. Produce $A'B'$ to D (then BD is perpendicular to the planes) and draw BN perpendicular to $A'D$. Then, since $B'B=B'D$ and $AB=A'N$, the length of path of the ray $A'B'C$ is greater than that of the ray ABC by the distance $ND=2d \sin\theta$. Similarly, $A''B''C$ is longer than $A'B'C$ by the same amount. If, now, this distance is equal to the wave-length of the rays, namely, if $\lambda=2d \sin\theta$, the rays reflected by successive layers of particles will be vibrating in the same phase and their amplitudes will be added together. If the glancing angle θ be varied but slightly the reflections from the millions of layers will vary in phase and they will mutually interfere. But at certain other glancing angles θ_2, θ_3 when $2\lambda=2d \sin\theta_2$ or $3\lambda=2d \sin\theta_3$, there will again be an accumulative effect, giving reflections of the second and third orders. (See fig. 6.)

In the Bragg apparatus, called an X-ray spectrometer, homogeneous ("monochromatic") rays from an X-ray tube emerge through a narrow slit in a leaden screen and strike at a glancing angle the crystal plate mounted on a goniometer. The reflected beam enters an ionization chamber containing sulphur dioxide or methyl bromide and connected with an electroscope. The crystal is slowly turned on the goniometer until a maximum effect is noted in the electroscope, when the angle θ is read. Plotting the readings of the electroscope against those of the goniometer, a curve (X-ray "spectrum") is obtained which shows a series of sharply defined maxima or peaks corresponding to reflections of the first, second, and other orders. Knowing the wave-length of the rays, the distance between the planes of particles can then be calculated from the above fundamental equation; or alternatively, knowing the spacing of the planes, the wave-length of the rays can be determined. As an example, rays from a palladium anticathode ("palladium rays") were strongly reflected from the cube face of rock-salt when the angle θ was 5·9°, 11·85°, and 18·15°. Taking the spacing d between the cube planes of rock-salt as $2{\cdot}81\times10^{-8}$ cm., the wave-length λ is found to be $2\times2{\cdot}81\times10^{-8} \sin 5{\cdot}9° = 0{\cdot}578\times10^{-8}$ cm., or $2\lambda = 2\times2{\cdot}81\times10^{-8} \sin 11{\cdot}85° = 1{\cdot}154\times10^{-8}$ cm.

To return now to an explanation of the spots shown by the Laue photographs. Here, instead of homogeneous rays, the rays employed are of mixed wave-lengths (as in white light). For such a bundle of rays reflected by a certain set of parallel planes (as explained in fig. 6) there will be some of wave-length that will satisfy the equation $\lambda=2d \sin\theta$, or at least $n\lambda=2d \sin\theta_n$. There will then be a reinforcement in the reflection of these rays from the particular set of planes. Let fig. 7 represent a plate of beryl cut perpendicular to the principal axis of the crystal, the upper and lower boundaries in the figure being then parallel to the basal plane. The rows of particles lie in the traces of two sets of planes respectively parallel to two possible pyramidal faces of the crystal. Reflection from these will yield two spots on the photographic plate. Now, according to the hexagonal degree of symmetry possessed by beryl, there will be 6 (or 12) similar sets of planes equally inclined to the vertical axis, and corresponding to a hexagonal (or dihexagonal) pyramid; consequently 6 (or 12) similar spots will appear on the photograph equally distant from the centre. For other sets of 6 (or 12) planes inclined at other angles to the vertical axis of the crystal, and parallel to possible faces of hexagonal or dihexagonal pyramids, intensified reflections will take place for rays of other wave-lengths. The result will be a large number of spots on the photographic plate, but all of them in sets of 6 (or 12) symmetrically grouped around the centre.

Some of these Laue photographs are highly complex in appearance, but by analysis they can be reduced to simple crystallographic relations. Since each spot represents a structural plane in the crystal and also a possible external crystal-face, the series of spots lie in zones and their Millerian indices can be deduced. Further, it will be seen from fig. 7 that the distances of the spots from the centre are in direct relation to the inclinations of the various planes. Fig. 8 (after H. Haga and F. M. Jaeger, 1915) shows plotted on a stereographic projection the series of spots of a Laue photograph on the face (010) of anhydrite. The spots are here symmetrical with respect to two lines at right angles, corresponding with the orthorhombic symmetry of the crystal. The zone-circles are drawn in one-half of the diagram and the indices of the planes are given in one-quarter. It is thus possible to deduce from the Laue photographs not only the zonal relations and indices of possible faces (many of which have not been observed as actual faces), but also the angles between these faces and the fundamental elements of the crystal. This information can even be obtained from an irregular fragment showing no external faces and of unknown orientation. Such a fragment is mounted on a two-circle goniometer and a series of Laue photographs taken in various positions; and a special instrument is provided for the analysis of the series of photographs.

A further point to be noticed in the Laue photographs (figs. 5 and 8) is that the spots are of different sizes and intensities (though spots repeated by the symmetry are, of course, identical). The stronger reflections are from planes of greater reticular density and indicate at once the important structural planes and the prominent faces of the crystal.

A third method of investigation has been devised by P. Debye and P. Scherrer in Germany in 1916, and independently by A. W. Hull in the United States in 1917. Here a beam of homogeneous ("monochromatic") X rays of known wave-length is transmitted through the finely powdered crystalline material, and the reflections received on a photographic film. The tiny crystal fragments are in all manner of orientations; and to further ensure all possible orientations in the aggregate, the tube containing the small amount of powder is rotated during the exposure. For structural planes with the spacing d there are bound to be some of the particles in the position shown in fig. 6 in which the equation $\lambda=2d \sin\theta$ is satisfied: but these will be lying in all azimuths, *i.e.* sloping away in all directions at the angle θ from the axis of the rays. The reflected rays will consequently lie on the surface of a cone, the angle of which is 4θ; and, instead of a single spot, a continuous series of spots forming a circle will appear in the photograph. Similarly, in other fragments the same set of planes with spacing d may be inclined at angle θ_2 giving a second order reflection as required by the equation $2\lambda=2d \sin\theta_2$, and producing a wider-angled cone concentric with the first. Further, other structural planes with spacing d_1 and inclined at other values of θ will be provided by other fragments, giving still other conical reflections. Since, however, the experiment is performed with rays of one wave-length, it is only certain values of d that will satisfy the equation, so that the number of reflections is really limited. Even with this limited number, there would appear to be some difficulty in sorting out the reflections of the different orders and those from different structural planes. Since it is only the angles of divergence of the concentric conical sheaths that are to be measured, all that need be photographed is a narrow strip through the centre. This strip is made semicircular, in order to embrace a wide field of reflected cones. Knowing θ and λ, the equation gives, as in the Bragg method, the spacing d between the structural planes of the crystal.

Although the Debye-Scherrer method may be regarded as a modification of the Laue method, yet the results it gives are the same as those given by the Bragg method, namely the spacing between the structural planes of the crystal. The Laue method gives other supplementary information, but it is mainly on the spacing between the planes of particles that ideas of structure are built up. A large amount of experimental work on crystals of different substances has been done in this direction, and deductions have been drawn as to their probable atomic arrangement. In this place only one or two examples can be briefly considered.

Rock-salt (sodium chloride) crystallizes in cubes and possesses a perfect cleavage parallel to the faces of the cube. Plates cut parallel to the faces of the cube (100), the rhombic-dodecahedron (110), and the octahedron (111) respectively give by the Bragg method values for the spacing between the planes of particles in the ratio of $1:1/\sqrt{2}:1/\sqrt{3}$. These ratios are the same as those mentioned above for the simple cubic space-lattice (figs. 1–3), and the conclusion

CRYSTALLOGRAPHY

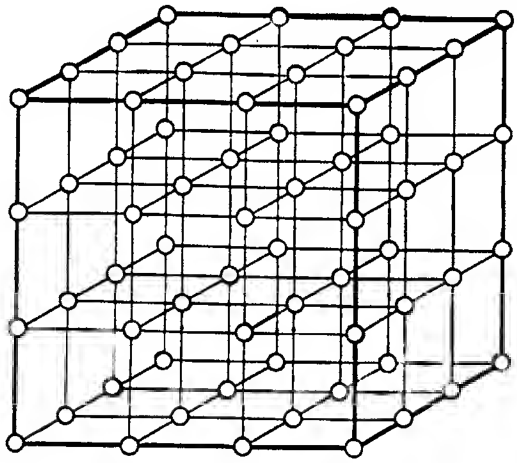

FIG. 1.—Simple Cubic Space-Lattice.

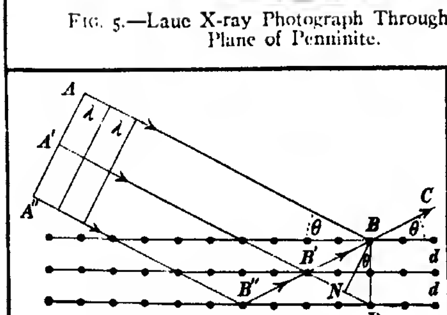

FIG. 6.—Reflection of X Rays by Planes of Particles.

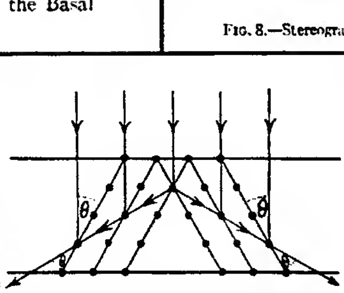

FIG. 7.—Reflection of X Rays by Planes of Particles: production of spots in the Laue photographs.

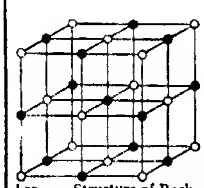

FIG. 9.—Structure of Rock-salt (sodium and chlorine atoms in simple cubic space-lattice): or of Galena (Pb S).

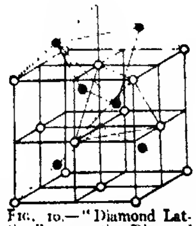

FIG. 10.—"Diamond Lattice" representing Diamond when the atoms are all of the same kind, or Zinc-blende when of two kinds.

may be drawn that this represents the structure of rock-salt. The two kinds of atoms, sodium and chlorine, may be placed alternately along the three directions, as shown in fig. 9. As so represented the structure may also be regarded as an interpenetration of two space-lattices of the face-centred cubic type (fig. 4c), with the sodium atoms on one lattice and the chlorine atoms on the other. One lattice can be brought into the position occupied by the other by a parallel shift along a cube edge through the distance between two consecutive planes. The actual distance between the cube planes, and consequently also between the atomic centres, has been determined to be $2\cdot81\times10^{-8}$ cm., or rather more than a hundred-millionth of an inch. In the drawings, the scale of the lattice is enormously enlarged and only an infinitesimal portion of the crystal is represented. Some idea of this may be conveyed by saying that if we took a cubic inch of rock-salt and represented the whole of the structure on the same scale as in fig. 9 the drawing would be rather more than a thousand miles across. The same structure is also shown by galena (lead sulphide, PbS), the crystals of which also possess a perfect cubic cleavage: the two kinds of atoms shown in fig. 9 here represent lead and sulphur. Other examples are potassium chloride, potassium bromide, etc.

Examples of crystals with the structure of the centred cubic lattice (fig. 4b) are those of the metals iron, sodium, tungsten, etc. The face-centred cubic lattice (fig. 4c) is represented by crystals of the metals copper, silver, gold, platinum, etc.

A special type of cubic lattice, known as the "diamond lattice," consists of another kind of interpenetration of two face-centred lattices. In fig. 10, to avoid confusion, only one such lattice is represented in detail—the white particles clearly having positions shown in fig. 4c. Four black particles belonging to the other lattice are placed each at a centre of alternate sub-cubes in the first lattice. Through the whole structure there are, of course, equal numbers of the white and black particles. The positions of two more black particles are indicated in the next storey above of the white-particle lattice. Now it will be seen that around each black particle there is a tetrahedral arrangement of four white particles; and around each white particle a tetrahedral arrangement of four black particles (but, conversely, it is only alternate tetrahedral groups of each kind that have a particle of the other kind at their centre). The front outlines of two of these tetrahedra are indicated in the figure. The upper tetrahedron of four black particles has at its centre the white particle in the centre of the top cube face; and one of these same black particles is at the centre of the tetrahedron of white particles at alternate corners of the upper, front, right-hand sub-cube. The first tetrahedron can be brought into coincident position with the second by sliding it downwards and forwards along one-quarter of the diagonal of the cube, and then rotating it through 90° about a cube edge. The same is also true of the whole lattice; *i.e.* one lattice can be brought into exactly the position of the other by these two successive operations. The symmetry of the whole model is that of the tetrahedral class of the cubic system; but, in addition, the two sets of particles are directed towards different directions. Regarding the particles as spheres of equal size and in contact with one another, then each one is touched by only four others, the latter with a tetrahedral arrangement; much of the space is thus vacant, and more spheres of the same size could be dropped into the larger interspaces. Or again, if the particles (all of the same size) entirely fill λ space, they will have the form of regular tetrahedra the four corners of which are each replaced by three faces of the rhombic-dodecahedron (much as in fig. 33, vol. 7, p. 575, but with the faces of the tetrahedron cut off to regular hexagons).

This type of structure is shown by diamond, silicon, grey tin, and zinc-blende, and also by copper-pyrites (a tetragonal mineral, but with very nearly cubic angles). In the first three, being chemical elements, the atoms on the two lattices are of the same kind. In diamond each carbon atom is surrounded tetrahedrally by four others at a distance, between the centres, of $1\cdot53\times10^{-8}$ cm. In zinc-blende (ZnS) the zinc atoms lie on one lattice, whilst the sulphur atoms lie on the other. Since the two lattices are identical and superposable, it is immaterial whether the black particles represent sulphur or zinc atoms. In copper-pyrites ($CuFeS_2$) the sulphur atoms are said to lie on one lattice and the copper and iron on the other; the copper and iron atoms being in alternate horizontal layers perpendicular to the principal axis of the crystal. It is, however, to be remarked that these three minerals, to which the same type of structure is ascribed, exhibit marked differences in their cleavages. Diamond has a perfect octahedral cleavage, zinc-blende a perfect rhombic-dodecahedral cleavage, whilst copper-pyrites has none. Again, the high density and the extreme hardness of diamond would seem to suggest that there should be less unoccupied space in the structure.

A fuller account is given in Bragg's book quoted above. A series of excellent summaries of this and other matters relating to chemical crystallography are given by T. V. Barker in the *Annual Reports of Progress of the Chemical Society* (London, 1913 *et seq.*). In the latter will also be found the best available account of the extraordinary work of the Russian crystallographer, E. S. Fedorov, who perished in Petrograd in 1919.

REFERENCES.—A comprehensive and general treatise is A. E. H. Tutton's *Crystallography and Practical Crystal Measurement* (London 1911; 2nd ed. 1921). A popular work of the same author is *Crystals* (International Scientific Series, London 1911). Structure theories are discussed by P. Niggli, *Geometrische Krystallographie des Diskontinuums* (Berlin 1918); F. M. Jaeger, *Lectures on the Principle of Symmetry* (Amsterdam 1917; 2nd ed. 1920); J. Beckenkamp, *Statische und kinetische Kristalltheorien* (Berlin 1915); see also Bragg and Barker quoted above. Elementary text-books are: T. L. Walker, *Crystallography, an Outline of the Geometrical Properties of Crystals* (New York 1914) in which the subject is treated from the point of view of two-circle goniometry; Sir Wm. P. Beale, *An Amateur's Introduction to Crystallography from Morphological Observations* (London 1915); P. Groth, *Elemente der physikalischen und chemischen Krystallographie* (Munich 1921); J. Beckenkamp, *Leitfaden der Kristallographie* (Berlin 1919). A collection of thousands of drawings of crystals with critical lists of forms is given by V. Goldschmidt, *Atlas der Krystallformen* (several 4to vols., in progress, Heidelberg 1913, etc.). New crystal-forms together with other crystallographic constants are listed in the international *Tables annuelles de constantes et données numériques* (4 vols., Paris 1912, etc.). An historical sketch of the early development of crystallography is given by Hélène Metzger, *La genèse de la science des cristaux* (Paris 1918). (L. J. S.)

CSAKY, ALBIN, COUNT (1841–1912), Hungarian statesman, was born on April 18 1841 at Krompach, in the county of Szepes, and studied law at Kassa (Kaschau) and Budapest. Deputy in 1865, he was from 1868 to 1880 *Obergespan* (lord-lieutenant), in which capacity he gained the reputation of an excellent administrator. In 1884 he pleaded eloquently in the House of Magnates for the establishment of civil marriage, and in 1888 was Minister of Education in the Cabinet of Koloman Tisza. Together with Szilagyi, the Minister of Justice, Csaky was one of the most decided champions of obligatory civil marriage and of the rights of the Jews. He resigned in 1894, and in 1900 was appointed president of the House of Magnates, an office which he resigned on the fall of the Liberal party in 1906. Under the Khuen-Hedvary Government he became on June 18 1910 once more president of the House of Magnates.

CUBA (*see* 7.504*).—From 1900, when for the second time the management of Cuban affairs was turned over by the United States to the Cuban Government, until the end of 1920, there was a steady growth in Cuba's prosperity. This growth was greatly accelerated during the first half of the year last mentioned, but suffered a serious reverse toward the end of the year. The census of 1919 showed a pop. of 2,898,905 (1907, 2,048,980), an average of 65·56 per sq. mile. The total immigration was in 1914, 24,420; in 1918, 37,320; and in 1919, 80,485. Of immigrants in 1919, 30,573 were from Spain. The immigrants from Jamaica, who numbered only 995 in 1914 and 9,184 in 1918, increased to 24,187 in 1919. It is stated that probably 75% of the immigrants return to the country of origin within the course of a year, coming to Cuba only for the high wages paid during the cane cutting and grinding season.

The Sugar Industry.—Sugar is the basis of Cuba's prosperity. The climate and fertile soil are admirably adapted to the growth of sugar cane, and the island has come to be recognized as the "sugar bowl of the world." The high prices that prevailed in 1919-20 enabled the sugar industry to put more of the soil under cane than ever before and to construct many of the most modern and efficient sugar mills in the world. The sugar crop, which in 1910–1 totalled 1,379,609 long tons, steadily increased, except for a slight decline in 1914–5. In 1918–9 the production reached 3,720,000 tons or 61% of the total cane sugar produced by the western hemisphere, 34% of the world's cane sugar production, and 25% of the world's total sugar production, as against an average of 11% in the decade preceding the World War. Production increased more than 50% during the five years 1913–4 to 1918–9. During the period 1909–14, approximately 95% of Cuba's crop went to the United States (almost half of that country's supply), the remaining 5% being used for home consumption. In 1917–8 the entire crop, except that used for home consumption, was purchased by the United States and the Allies, two-thirds for the former, one-third for the latter. The 1918–9 crop was similarly contracted for, but part of the share of the United States was later diverted to other countries. The crop for 1919–20 was 3,730,077 tons. The price, which had been from two to three cents a pound before the war, advanced slowly but steadily during the war. The crop for 1917–8 was sold to the United States at 4·6 cents f. o. b. Cuban ports, and that for 1918–9 at 5½ cents. But the next year the world's shortage (nearly 2,000,000 tons compared with 1913–4), the increased consumption in the United States and the failure of the latter to purchase the 1919–20 crop, although it was offered and could probably have been obtained at about 6½ cents a pound, caused a keen competition for the Cuban supplies,

**These figures indicate the volume and page number of the previous article.*

opened the way for wild speculation and led to an unprecedented rise in price. In the early part of the year the price was about 11 cents a pound, but rose rapidly until a peak of 22½ cents was reached in May, when the market broke. Thereafter, the price declined almost as rapidly as it had risen, reaching at the end of Nov. about 3½ cents, near which it continued for several months. To prevent a further decline and, if possible, force an upward reaction, a price-fixing commission was in Feb. 1921 appointed by the president of Cuba and given power to control the sale and exportation of the entire 1920–1 crop.

Other Industries.—Of the island's agricultural products, tobacco ranks next to sugar in importance, the total value of the crop ranging from 40 to 50 million dollars per annum. A high import duty recently placed upon coffee had the effect of stimulating that industry, but the production in 1919 was still far below the requirements of the population. The culture of henequin or "sisal" promised to become important, as did also the production of jute. Cotton was being cultivated experimentally. The cultivation of fruit and vegetables for winter consumption in the United States was quite an extensive industry, the soil and climate lending themselves easily to the production of citrus fruits, bananas, pineapples, coconuts and various garden vegetables. Cuba produced an appreciable portion of the world's supply of sponges. The average output of Batabanó, where 25% of the male population were engaged in this industry, is said to approximate half a million dollars a year. There was a considerable and growing interest in the cattle industry, and hides and skins were exported in increasing quantities. In 1911 a commission was sent to the United States to purchase thoroughbred stock for breeding purposes at the six Government experiment stations. There were, in 1919, about 4,000,000 head of cattle, 780,000 horses, and 64,570 mules. The manufacture of turpentine was a new industry, begun after an investigation of pine trees in the Isle of Pines. Of mineral products, iron continued to be the most important, though mines of manganese, copper and asphalt were important. The iron deposits in the province of Oriente near Santiago de Cuba, in spite of active mining since 1908, can be said to be hardly touched. The iron mines in this district employed over 4,000 workmen and supplied an average of 50,000 tons of ore per month to the United States. Exploitation for petroleum has been going on for several years, but no proof has been found of oil deposits of commercial importance.

Commerce.—Cuba is an intensely commercial country, exporting most of what she produces and importing nearly everything that she consumes. Metals and manufactures thereof constitute about 7% of her total imports; drugs and chemicals 7%; textiles and manufactures 13%; paper 2%; wood and manufactures 3%; animals and their products 5%; machinery and instruments 12 to 13% and foods 35 to 40%; the balance being made up of miscellaneous articles. Of exports, sugar constitutes about 85%, tobacco 8 to 10%, fruits about 2%, minerals and ores 3%. During the fiscal year 1913–4, the last normal year before the war, the total commerce of the island was valued at $304,805,000, with imports valued at $134,008,000 and exports $170,797,000, imports from the United States representing 53·2% and exports to the United States 80% of the total. Sugar represented 70% and tobacco 20% of the exports, whereas from 1904–7 they had represented 60·3 and 27·3% respectively. Cuba enjoys a preferential duty of 20% on exports to the United States and grants reciprocal concessions of 20 to 40% on all merchandise imported from the United States. This accounts for the dominant position of the United States. During the fiscal years 1912–3 to 1915–6, the United States received on an average 80·6% of the total exports from Cuba. For the years 1916–7 and 1917–8 the average was 71·86%, this reduction in percentage being due to shipments of sugar to the Allies in Europe where production of beet sugar had been lowered by the war. Cuba's international trade for the fiscal year 1918–9 was $794,000,000, exports totalling $477,000,000 and imports $316,000,000.

The United States supplied 74·5% of the imports and received 73·2% of the exports. The import item of greatest value was foodstuffs worth $115,000,000. Exports of sugar and its products amounted to $409,629,000, representing 85·6% of the total, while exports of tobacco and its products amounted to $40,837,000, or 8½% of the total exports. Cuba's total foreign trade during the fiscal year 1919–20 amounted to $480 per capita, about four times as much as that of the United States during 1920 and probably more than that of any other country for any year. During 1920 the trade of the United States with Cuba was greater than the combined trade with the three next most important Latin-American customers—Argentina, Brazil, and Mexico; and United States trade with Cuba for the same year was only slightly (a little under 10%) less than with all South America. The total value of imports from the United States in 1918–9 was $235,727,000, compared with $228,102,000 in 1917–8. Imports from Great Britain in 1918–9 amounted to $9,349,000; from Spain $13,332,000; from France $8,265,000 compared with $12,508,000, $11,695,000 and $6,875,000 respectively in 1917–8. Exports from Cuba to the United States in 1918–9 were $350,316,000; to Great Britain $96,814,000; to Spain $6,057,000; to France $11,324,000. Exports to these countries in 1917–8 were $278,704,000, $76,722,000, $4,199,000 and $8,965,000 respectively. During the calendar year 1919, imports from the United States amounted to $278,371,222, and exports to United States $418,610,263. For the calendar year 1920, imports from the United States amounted to $515,082,549 and exports to the United States $721,695,905. Thus, the total trade between the United States and Cuba was almost twice as great in 1920 as for the fiscal year 1918–9.

Port Congestion.—When, early in 1920, fabulous prices for sugar prevailed, and all kinds of merchandise sold readily at high prices, goods were ordered abroad more rapidly than they could be cleared through the customs house. This condition grew steadily worse until near the end of the year when, after the appointment of a special supervisor charged with the duty of clearing the ports, recommendations made by a joint Cuban-American Port Congestion Commission which had sat at Havana in Aug. were put into operation. Thereafter, improvement though slow was steady. The situation was aggravated by the desire of many importers to cancel their orders for high-priced merchandise when the general decline in prices held out a prospect of obtaining cheaper goods. In the case of rice, the concerted efforts at cancellation became so general that the Government placed a temporary embargo on further importations of rice except on special licence. The port congestion and the cancellation movement were both intensified by the declaration of a moratorium in October.

Communications.—Cuba had in 1920 four principal railway systems which together extended their lines from one end of the island to the other, namely, the United Railways of Havana, the Cuba Railroad, the Cuban Central Railways, and the Western Railway of Havana. These systems, together with the private lines connecting the larger sugar estates with them, constituted 3,200 m. of railway in 1919 as against 2,329·8 m. in 1908. Considerable attention has been paid in recent years to the construction of good roads, and large sums of money have been voted. In 1919 there were said to be over 1,400 m. of splendid roads for automobiles. A car ferry service between Key West and Havana inaugurated in 1915 greatly facilitated the movement of freight between Cuba and the United States. Direct steamship connexion existed with many of the ports of the United States as well as with Europe and Mexico. Frequent service was maintained to New York, Boston, Philadelphia, Galveston, New Orleans, Mobile, Tampa and Key West, and in 1920 regular passenger and freight service was inaugurated by the Miami Steamship Co. between Jacksonville, Fla., and Havana, with sailings every five days. Air mail service was started late in 1920 between Key West and Havana with two seaplanes, each having a capacity of 1,000 lb. of mail, 12 passengers and 400 lb. of luggage.

Education.—Educational affairs were given increasing attention after 1908. Considerable sums of money were appropriated and many new schools established, among them normal schools in the several provinces, numerous day schools, several night schools, and agricultural experiment schools in Havana. A national military academy was established in 1912. A bill was passed in 1916 granting to rural public-school teachers an increase in salaries aggregating more than $1,000,000 per year. This raised individual salaries of $45 and $50 per month to $75 and $80. On Nov. 30 1919 there were 5,877 teachers and 334,671 pupils in the elementary schools. In "Institutes of Secondary Instruction" there were 2,087 students in 1915–6. The university of Havana was said to have, in 1919, nearly 1,600 students.

Finance.—Until recent years Cuba had no money of its own issue, mainly Spanish gold and various other foreign coins having been the medium of exchange; but in 1915, by virtue of an Act passed during the preceding year, a new coinage was put into operation. The monetary unit is the gold peso of the same weight and fineness as the American dollar. Gold coins, of which the issue is unlimited, are 1, 2, 4, 5, 10 and 20 peso pieces, the last three of the same shape, weight and value as corresponding U.S. coins, and the others proportionate; silver coins, of which the issue is limited to 12,000,000 pesos, are 10, 20 and 40 centavo pieces and the peso; nickel coins, limited by executive discretion only, are 1, 2 and 5 centavo pieces. United States coins and paper currency are also legal tender, but not those of other foreign countries unless such payments are specifically contracted for. The revenues of the Government, which in 1912–3 amounted to about 37·9 million dollars, rose to 64·5 millions in 1918–9, and 79 millions in 1919–20. More than half of the revenue is derived from customs duties. Cuba had in 1920 a foreign debt of about $51,000,000, floated through banking houses in the United States, also a domestic debt of about $39,000,000.

The Moratorium.—The enormous profits derived from the sale of high-priced sugar during the first half of 1920, instead of being conserved in the form of liquid assets were invested in enlarging the facilities for producing and grinding sugar, in building fine homes and in purchasing luxuries. When, about midsummer, the price of sugar began to decline, an effort was made to check the tendency by refraining from selling the remaining portions of the preceding crop. To continue operations and prepare for harvesting the new crop, large amounts of money were borrowed from the banks, the unsold sugar being pledged as security on what was at the time regarded as a safe basis of 15 or 16 cents per pound. The experiment was unsuccessful. The rapid decline soon carried prices far below the point at which the banks had accepted the sugar as security. Thereupon, it ceased to be an asset and became a liability. Early in Oct. there occurred a run on one of the largest banking institu-

tions in Havana, which had many branches throughout the island. In order to prevent the collapse of this bank, and the extension of the panic to others, a moratorium was declared on Oct. 10 to last for 50 days. On Dec. 1 it was extended until Dec. 31, and again until the end of Jan. 1921. Just before the last date, a Congressional Act provided for the gradual lifting of the moratorium, requiring partial payments running through 105 days for ordinary commercial obligations, and 135 days for banking obligations. A law was simultaneously promulgated providing for the liquidation of insolvent banks under Government supervision; and provision was also made for a reform in banking laws with a view to preventing a recurrence of such a condition.

Political Conditions.—The administration of President José Miguel Gómez and Vice-President Alfredo Zayas of the Liberal party continued from Jan. 28 1909 (at which time the administration of the American Provisional Government ceased) until May 20 1913. During this period there were internal troubles which threatened to assume a revolutionary character. A serious revolt of negroes in May 1912 was followed shortly afterwards by the concentration of a U.S. fleet of battleships at Key West. President Taft assured the Cuban Government that this was not due to a purpose of intervention, but to a desire to act promptly in case it became necessary to protect American life and property. By the middle of the summer the rebellion was suppressed. On Nov. 1 1912, Gen. Mario G. Menocal and Enrique José Varona, Conservative candidates, were elected president and vice-president, respectively, and were inaugurated on May 20 1913. The administration proved to be efficient. The Government's progressive policy was evidenced by the attention given to educational affairs, by the enactment of comprehensive health laws and by large expenditures for the development of the resources of the country and for public works. During 1915 there was considerable political activity looking toward the elections of Nov. 1 1916, the Conservatives supporting Menocal for reelection while the Liberals, under the leadership of Alfredo Zayas, a former vice-president under Gómez, were trying to secure control. Menocal's reëlection was declared Nov. 5, but was contested, and not until May 7 1917 was it finally proclaimed by the Cuban Congress. This contesting of the election occasioned a revolt by the Liberals under the leadership of ex-President Gómez, which assumed serious proportions; but by May 20 the revolt had subsided and Gen. Menocal took the oath of office for a second term. On April 7 1917, Cuba declared war on Germany. The president of the republic was authorized to dispose of the land and naval forces and the economic resources of the nation in whatever manner necessity required. Several revenue measures were announced, including normal and extraordinary war taxes on sugar, and taxes on net profits of mining and insurance companies. A bond issue of $13,000,000 was authorized for a war loan beginning July 1. In 1918 an obligatory military service law was put in force and a Food Administration with extensive powers was established. Diplomatic relations with Germany were renewed on Oct. 27 1920. A new electoral law was passed in Aug. 1919. This new code was compiled with the assistance of Maj.-Gen. Enoch H. Crowder of the U.S. army. It was he who, while serving with the American army of occupation in Cuba, had formulated the existing laws and had supervised the first presidential election. The new law provided for recognition of all political parties and for public counting of ballots. This new law was put to the test on Nov. 1 1920, which marked the end of the most bitter political campaign since Cuban independence. José Miguel Gómez (1856–1921) was the Liberal candidate, and Dr. Alfredo Zayas was the candidate of the National League or Coalition party, the latter having broken away from the Liberal party and, backed by the Menocal administration, parted company with Gómez. The result of the election was doubtful. Charges of unfair practices made investigations necessary. Incorrect interpretations placed upon the new election laws brought about a complete deadlock. Early in Jan. 1921 Gen. Crowder was sent to Cuba as the personal representative of President Wilson. As a result of his interpretation, means were found for facilitating the procedure of the courts in the contested election cases, and supplementary elections were held in March.

(W. R. Ma.)

CUMMINGS, WILLIAM HAYMAN (1831–1915), English musician, was born at Sidbury, Devon., Aug. 22 1831, the eldest son of Edward Manley Cummings. He became a chorister at St. Paul's cathedral and the Temple church, and was subsequently appointed organist of Waltham Abbey. Later he was appointed tenor at Westminster Abbey, the Temple church and the chapels royal, being well known for many years as an oratorio singer. From 1879 to 1896 he was professor of singing at the Royal Academy of Music, and from 1896 to 1910 principal of the Guildhall School of Music. In 1900 he received the degree of Mus. Doc. from Dublin University. Cummings was the author of many works on music, including *Lives* of Purcell (1881) and Handel (1904), and *The Origin and History of "God Save the King"* (1902). He was also an authority on ancient music, and left a fine collection of old MSS. and early editions. He died at Dulwich June 6 1915.

CUMMINS, ALBERT BAIRD (1850–), American politician, was born at Carmichaels, Pa., Feb. 15 1850. After leaving Waynesburg (Pa.) College he studied surveying and became assistant chief engineer for a railway. He next studied law, was admitted to the bar in 1875, and for three years practised in Chicago. In 1878 he went to Des Moines and ten years later was a member of the Iowa House of Representatives. He was chairman of the Republican State Committee (1892, 1896), candidate for the U.S. Senate (1894, 1900), member of the Republican National Committee (1896, 1900), and a delegate to the Republican National Convention on four occasions. He was elected governor of Iowa in 1902 and reëlected for two succeeding terms. He filled the unexpired term of Senator Allison in 1908, and was reëlected to the U.S. Senate in 1909 and 1915. He opposed the nomination of Mr. Taft in 1912, but did not bolt his party. He was specially identified with measures concerning trusts and railways, and had a leading part in drafting the so-called Esch-Cummins bill under which the Government in 1920 handed back to private control the railways of the United States.

CUNLIFFE, WALTER, 1ST BARON (1855–1920), English banker, was born in London Dec. 4 1855, the son of Roger Cunliffe, a banker of the City of London. He was educated at Harrow and Trinity College, Cambridge, and entered upon his banking career in the City in 1880, establishing ten years later the merchant banking business of Cunliffe Bros. He became a director of the Bank of England in 1895, was elected deputy governor in 1911 and governor in 1913. He was, therefore, in office as governor when the World War broke out, and, after being raised to the peerage with the title of Baron Cunliffe of Headley in Dec. 1914, he was continued as such by successive reëlections until 1918, a longer period than had ever been served before. During the whole of this period the deputy-governor was Mr. Brien Cokayne, who was knighted in 1917, and who, after succeeding Lord Cunliffe as governor, was created Lord Cullen of Ashbourne on his retirement in 1920. Lord Cunliffe was associated with the working out of all the chief financial problems during the war, and in 1917 accompanied Mr. Balfour on his financial mission to the United States. He died suddenly at Epsom Jan. 6 1920.

CUNNINGHAM, WILLIAM (1849–1919), English economist (*see* 7.633), died at Cambridge June 10 1919.

CUNNINGHAME-GRAHAM, ROBERT BONTINE (1852–), British author and traveller, was born in 1852, the son of William Cunninghame-Graham Bontine of Ardoch and Gartmore, and was educated at Harrow. He sat in the House of Commons for North Lanarkshire from 1886 to 1892, and during this period became known as an extreme Socialist, taking part with H. M. Hyndman and others in Socialist meetings and processions in London to demand work for the unemployed. He travelled much in North Africa, Mexico and South America, and wrote a number of short stories and vivid studies of life in those regions. Among his books may be mentioned *Mogreb-el-Acksa: a Journey in Morocco* (1898); *The Ipane* (1899); *A Vanished Arcadia* (1901); *Faith* (1909); *Hope* (1910); *Charity* (1912); *A Life of Bernal Diaz del Castillo* (1915); *A Brazilian*

Mystic (1920); *Cartagena and the Books of the Sinu* (1920). Early in the World War he went to South America to buy horses for the British army, and carried out his mission with success.

CURRIE, SIR ARTHUR (1875–), Canadian general and administrator, was born at Napperton, Ont., Dec. 5 1875. On the outbreak of the World War his natural bent for military affairs quickly brought him to the front. He commanded the 1st Canadian Div. 1914–7, and the Canadian Corps in France 1917–9. He gained the confidence of the English military authorities in the field, and when Lord Byng resigned his command of the Canadian troops Sir Arthur Currie was the one Canadian to whom it was felt by the British Headquarters that the command could be entrusted. The manner in which he carried out his command marked him by common consent a military leader of unusual distinction. In the concluding phases of the war the Canadian forces under his command played a notable part. Currie was given the C.B. in 1915, K.C.M.G. 1917, K.C.B. 1918 and G.C.M.G. 1919; he was awarded the French Legion of Honour and the Croix de Guerre both of France and of Belgium, and was created Grand Officer of the Belgian Ordre de la Couronne. In 1920, after Sir Auckland Geddes had finally declined the nomination to the principalship of McGill University, Montreal, on his appointment as British ambassador to Washington, Sir Arthur Currie was elected to the post.

CURTIS, CYRUS HERMANN KOTZSCHMAR (1850–), American publisher, was born at Portland, Me., June 18 1850. He was educated in the public schools of Portland, sold newspapers when a boy, and in 1870 joined a Boston paper as advertising solicitor. In 1876 he went to Philadelphia and became a publisher of the *Tribune and Farmer*, a weekly paper. In 1883 he established the *Ladies' Home Journal*, and in 1891 organized the Curtis Publishing Company. In 1897 he purchased the *Saturday Evening Post*, which was a direct continuation of the *Pennsylvania Gazette*, founded in 1728 by Benjamin Franklin, and in 1911 he bought the *Country Gentleman*. The *Ladies' Home Journal* and the *Saturday Evening Post* attained a circulation of 2,000,000 each, and probably carried more paid advertising than any other publications in the world. For this reason, although the cost of producing a copy of the *Saturday Evening Post* was many times its selling price to the public (5 cents), this magazine was highly profitable to the publisher. In 1913 he purchased the *Philadelphia Public Ledger*.

CURZON OF KEDLESTON, GEORGE NATHANIEL CURZON, 1ST MARQUESS (1859–), English statesman (*see* 7.665), received an earldom (along with the viscountcy of Scarsdale and the barony of Ravensdale) as one of the coronation honours in 1911. He was conspicuous in that year first by his strong denunciation of the Parliament bill and the whole Liberal attack on the Lords, and then by the leading share which he took, in the final stage, in persuading the bulk of the Unionist peers to abstain from voting in the crucial division and so to permit the bill to pass rather than have their House swamped by hundreds of creations *ad hoc*. During the vehement party conflicts of the next two or three years before the World War he established his position as the chief lieutenant of Lord Lansdowne in the Lords. But much of his time and attention during the period of opposition were given to the affairs of Oxford University, of which he had become chancellor; and he promoted the cause of reform there by personal effort and by publishing a detailed memorandum on the subject. With other Unionist leaders he joined Mr. Asquith's Coalition Cabinet in the summer of 1915, as Lord Privy Seal; and in that capacity he introduced the bill constituting the new Ministry of Munitions under Mr. Lloyd George, and took charge in the Lords of the Munitions of War bill which was to furnish that Ministry with its weapons. In these and other ways he gave proof of a determination to prosecute the war with zeal and energy. He accepted the presidency of the Air Board in May 1916, and in July became a permanent member of the War Committee of the Cabinet. When Mr. Lloyd George formed his Ministry in Dec., he was accorded a still more prominent position. Lord Lansdowne and Lord Crewe—the two leaders of parties in the Lords—both retired, and Lord Curzon became the leader of the House with the office of President of the Council. He was chosen also to be one of the four ministers (the others being the Prime Minister, Lord Milner, and Mr. Henderson) who constituted the War Cabinet, and were charged with the permanent daily conduct of the war. After the Paris Conference he took over the Foreign Office from Mr. Balfour, retaining his leadership in the Lords. As leader, though not able to claim the sympathetic touch and close familiarity with their lordships' idiosyncrasies possessed by some of his predecessors, he exhibited remarkable intellectual powers and oratorical capacity, and gradually established his ascendancy in the House. In the Foreign Office he found a specially congenial sphere, as he had throughout his life made a study of the external relations of the country, and had travelled extensively. But foreign affairs in the years immediately following the war were still dominated by the Prime Minister, and by the Supreme Council.

Lord Curzon's first wife, by whom he had three daughters, died in 1906, and in 1917 he married, as his second wife, Grace Elvina, widow of Alfred Duggan, of Buenos Aires, and daughter of J. Munroe Hinds, U.S. minister in Brazil. He succeeded to the barony of Scarsdale on his father's death in 1916, and became a K.G. in the same year. He was created a marquess on the King's birthday in 1921.

CUSHING, HARVEY (1869–), American surgeon, was born at Cleveland, O., April 8 1869. He graduated from Yale in 1891 and from the Harvard Medical School in 1895. After doing exceptional cerebral surgery abroad under Kocher at Berne and Sherrington at Liverpool he began private practice in Baltimore. Here at the age of 32 he was made associate professor of surgery at Johns Hopkins University, and at the hospital was placed in full charge of cases of surgery of the central nervous system. Yet he found time to write numerous monographs on surgery of the brain and spinal column and to make important contributions to bacteriology. He made (with Kocher) a study of intracerebral pressure and (with Sherrington) contributed much to the localization of the cerebral centres. In Baltimore he developed the method of operating with local anaesthesia, and his paper on its use in hernia gave him a European reputation. He has also made important contributions to the study of blood pressure in surgery. In 1911 he was appointed professor of surgery in the Harvard Medical School and surgeon-in-chief at the Peter Bent Brigham hospital in Boston. In 1913 he was made an hon. F.R.C.S. (London). In 1915, before the Clinical Congress of Surgeons in Boston, he showed the possibility of influencing stature by operating on the pituitary gland. During 1917–9 he was director of a U.S. base hospital attached to the B.E.F. in France. In 1918 he was made senior consultant in neurological surgery for the A.E.F. He held the rank of colonel in the Medical Corps of the U.S. army.

CUST, HENRY JOHN COCKAYNE (1861–1917), English journalist, was born in London Oct. 10 1861. Educated at Eton and Trinity College, Cambridge, he entered the House of Commons as Unionist member for Stamford in 1890, but lost the seat in 1895. He was returned for Bermondsey in 1900 and sat till 1906. In 1892 Mr. (afterwards Lord) Astor made him editor of the *Pall Mall Gazette*, and for four years he held that post with distinction, gathering round him a brilliant staff (*see* 19.561). In politics and society his personal charm and *esprit* always gave promise of more than he ever achieved in the way of public life. But in Aug. 1914, at the outbreak of the World War, he founded the Central Committee for National Patriotic Organizations, and a Cust annual lecture "on some important current topic relating to the British Empire" was endowed in Nottingham University to commemorate his work. His *Occasional Poems* appeared in 1918, printed in Jerusalem. He was heir to the barony of Brownlow, a position which at his death fell to his brother, Adelbert Salusbury Cust (b. 1867). He died in London March 2 1917.

CYTOLOGY (*see* 7.710).—The effect of the work done in cytology up to 1910 may be summarized as follows.

The bodies of animals and plants are made up of units termed cells, which may be compared to the bricks in a brick wall. Each cell

is composed of a viscid semi-fluid material termed protoplasm, surrounded by an elastic membrane termed a cell wall. This wall is composed of cellulose in the case of the vegetable cell and may acquire considerable thickness and firmness; in the animal cell it is almost always very thin, and never consists of cellulose: but appears to agree in composition with the protoplasm, of which it may be considered a condensation. There is reason to believe that in most if not all cases the cell wall is porous, and that adjacent cells are connected with one another by bridges of protoplasm.

The activities of living cells are manifested in four ways, viz.:—

(1) By movement, which takes the form of alternate contraction and expansion.

(2) By secretion, *i.e.* by the production of definite substances which accumulate in the protoplasm, but which are finally extruded from the cell.

(3) By the transmission of stimuli, so that shocks or stimuli of various kinds applied to one cell result in movement or secretion in a different cell.

(4) By reproduction, which takes the form of the division of the cell into two daughter cells.

All these activities are dependent for their continuance on the consumption of a certain portion of the protoplasm; and if life is to persist and if the cells are to increase in number this waste must be repaired. This is effected by the taking in and assimilation of food; and this assimilation can only be carried out if there exists in the protoplasm a specially differentiated portion termed the "nucleus," which appears to be of rather different composition from the rest. For this reason it is customary to use the term "cytoplasm" for the extra-nuclear protoplasm.

Cells may be specialized for rapid movement or for the reception and transmission of stimuli or for secretion. Locomotor cells may be provided with freely projecting filaments, termed "cilia" or "flagella," which are capable of rapid vibration, and act the part of oars in propelling the animal, or their cytoplasm may contain threads termed "myonemes" or "muscular fibrils," which are capable of thickening and contracting; and these threads may be simple or cross-striped—*i.e.* composed of alternate discs of singly and doubly refracting material; cells provided with these threads are termed "muscle cells."

Cells devoted to the reception and transmission of stimuli are known as "nerve cells" or "neurones." Those which are situated at the free surface of the animal, and which are provided with stiff processes of various kinds which are easily affected by stimuli, are known as "sense cells." Those which are more deeply situated have, in place of the stiff processes, one or more root-like branching processes known as "receptive dendrites." Stimuli when received are transmitted by outgrowths of the neurone known as "axons," and these axons, after preservation by fixing fluids, are seen to consist of a series of delicate fibres, the "neuro fibrillae." The axon ends in a brush of root-like processes called "terminal dendrites"; these dendrites are in contact either with the receptive dendrites of another neurone to which they hand on the stimulus, or with a muscle cell in which they cause contraction, or with a secretory cell in which they initiate secretion.

In the case of secretory cells the secretion may be fluid and poured forth at a free surface only, from which it is washed away by the currents of the circumambient medium. Of this type are the mucous cells which give rise to the slime which lubricates the skin of earthworms, or the similar cells which produce the mucus inside the human mouth cavity. On the other hand the secretion may take the form of fibres or another form of solid material and may be extruded from the entire surface of each cell so that the cell becomes in this way separated from its neighbours by masses of the secretion or, as it is now termed, the "intercellular substance." Cells of this kind are known as "connective tissue cells" and give rise to the various supporting tissues such as fibrous tissue, cartilage and bone.

The reproductive cells or "germ cells" are, as their name implies, cells which have the capacity of giving rise to a mass of cells out of which the body of a new individual is built up. They occur in many forms amongst the lowest grades of animals, *i.e.* the Protozoa, but amongst the higher animals, or Metazoa, they are remarkably constant in general characters, exhibiting practically the same forms throughout the whole range of animals from the sponges to the human race. They appear under two types, viz.:—(1) a small motile male cell, which consists mainly of a head which is a condensed nucleus, to which is added a vibratile flagellum termed the tail; and (2) a much larger motionless female cell or egg, in the cytoplasm of which there are deposits of food material known as yolk. Normally a male cell must unite with a female cell before development can be initiated, but the eggs of many animals can develop without this union and are then termed "parthenogenetic." In other cases where union with a male cell normally takes place eggs can be stimulated to develop without previous union with a male cell, and these cases are termed "artificial parthenogenesis."

Turning now to the consideration of the nucleus, we find that this is frequently invisible in the living cell, but when it can be made out it appears either as a clear vesicle (as in many eggs) or as a slightly more granular portion of the protoplasm (as in Amoeba). When, however, it is fixed and stained it exhibits a characteristic structure. It then appears as a vesicle containing a fluid termed the "nuclear sap," and bounded by a membrane termed the "nuclear wall." The sap is traversed by a network of threads known as "linin fibres," and adhering to these fibres—suggesting the arrangement of beads on a necklace—are a number of granules termed "chromatin" because they attract and retain the colouring matter of the staining fluid so strongly. In addition there are usually one or two rounded bodies termed "nucleoli," which also attract stain strongly, but these are apparently not composed of exactly the same chemical substances as the chromatin granules—and it is possible by the use of certain stains to colour them differently from the tint assumed by the chromatin.

We have already seen that assimilation or the building-up of fresh protoplasm is impossible in the absence of a nucleus. This is proved by dividing a uninucleate amoeba into two, when it is seen that the non-nucleate piece, though capable of movement, cannot digest or assimilate food and, after a short period of activity, dies.

The division of the nucleus always precedes the division of the cell and this division is occasionally direct, *i.e.* by the process of simple constriction into two, or much more frequently indirect by the process termed "karyokinesis" or "mitosis." In this method the chromatin grains were believed to become aggregated into a continuous spirally-coiled thread termed the "spireme," which then became segmented into a definite number of segments called "chromosomes." The chromosomes always appear in the same number in the same species at every division of the nucleus. Meanwhile the nucleolus or nucleoli disappear, apparently dissolved in the cell-sap; and the nuclear membrane becomes dissolved so that the cell sap is mingled with the cytoplasm; and then a small body termed the "centrosome," lying at the side of the nucleus in the cytoplasm, becomes discernible. The centrosome can occasionally be demonstrated lying at the side of the resting nucleus, but when it becomes visible in the process of mitosis it is seen to be in process of division into two. The chromosomes at the same time appear to be split longitudinally, whilst from the daughter centrosomes as they move apart a series of filamentous rays are developed, some of which ("astral fibres") extend out to the periphery of the cell, whilst others ("mantle fibres") become attached to the halves of the split chromosomes, one fibre from each centrosome going to a corresponding half of the chromosome. When the centrosomes have reached positions at opposite ends of the nucleus the mantle fibres proceeding from them have constituted the mitotic spindle: certain other fibres appear running directly from one centrosome to another in the axis of the spindle, which are termed "spindle fibres," whilst the split chromosomes, under apparent tension of the mantle fibres, have assumed positions lying at right angles to the axis of the spindle, and constituted what is called the "equatorial plate."

By a continuance of the apparent tension of the mantle fibres the two halves of each chromosome are dragged apart from one another, and eventually one set of half-chromosomes becomes massed together in the vicinity of each pole of the spindle, that is, close to each daughter centrosome. Each of such sets of chromosomes constitutes a daughter nucleus. The chromosomes become longer and thinner and more entangled with one another until the initial stage of a linin network with adhering chromatin granules is re-established, and round this a new nuclear wall is formed. The stages leading to the segmentation of the spireme thread and the solution of the nuclear membranes are termed the "prophases of mitosis"; those leading to the establishment of the equatorial plate are termed the "metaphase." The stage involving the separation of the halves of the chromosomes is termed the "anaphase," whilst the steps leading to the reconstitution of the daughter nuclei are termed the "telophases" of mitosis.

In the fertilization of the egg it is penetrated by the head of the spermatozoon which carries with it a segment of the tail termed the middle-piece. The middle-piece is distinguished by its diameter from the thinner more distal part of the tail and it includes a centrosome which has been derived from the centrosome active at the last division of the sperm mother cell. Sometimes the distal part of the tail is left behind at the surface of the egg—sometimes it penetrates with the rest of the spermatozoon. In the latter case it remains passive in one cell of the embryo and is absorbed and is without influence on the hereditary potencies of the embryo, since it is never distributed to any but the one cell. All the paternal influence must be carried by the head, which is a condensed mass of chromatin: hence is derived the strong belief that not only is the nucleus the bearer of hereditary powers but that the chromatin is the element of the nucleus in which they are concentrated.

The spermatozoon head, once immersed in the egg, swells up and assumes the characteristic structure of a nucleus: it acquires nuclear sap and a nuclear wall and its chromatin becomes resolved into the same number of chromosomes as are present in the egg nucleus. It is then known as the "male pro-nucleus," whilst the egg nucleus is termed the "female pro-nucleus." The centrosome derived from the middle piece gives rise to an enormous aster with radiating rays which is termed the "sperm-aster"; the two nuclei approach each other, and the sperm-aster then becomes changed into a spindle, and the chromosomes of both nuclei are arranged side by side on the equatorial plate of this spindle: so that when the compound or "zygote" nucleus divides equal portions of maternal and paternal chromatin are distributed to the first two cells of the embryo—and

the same thing follows at every subsequent division of the growing embryo, so that paternal and maternal chromatin is distributed in equal amounts to every cell of the body.

The ripe germ cell consequently possesses only one-half the number of chromosomes which the ordinary body cell possesses, and therefore at some time in its history a reduction of chromosomes must take place. The older view was that this occurred at one of the ripening divisions in consequence of the spireme becoming segmented into half the usual number of pieces: each of these pieces then exhibited a transverse split which was regarded as an indication of the belated appearance of the full number: at the first maturation division these halves were, however, supposed to be distributed to different cells, so that each daughter cell received only half the original number of chromosomes—this division was known as the "reduction division," or "meiotic division."

Since the chromosomes are usually invisible during the resting stage of the nucleus the question has been raised whether they retained their individuality throughout the whole growth cycle. Various considerations lead to the conclusion that their individuality is retained. In some cases where the number is very small, as in the cells of the nematode worm *Ascaris*, the chromosomes or at least their ends can be detected in the resting nucleus: moreover the chromosomes are not all alike, but differ in size and shape from one another, and to each paternal one there is a corresponding maternal one of similar size and shape, and it seems unlikely that, if they vanished in the resting stage, they should reappear in exactly the same form at the subsequent mitosis. It has been surmised that this individuality in form and size was an indication of a difference in function in distributing the hereditary qualities—and Boveri's[1] discovery that, when an echinoderm egg was entered by two spermatozoa, one alone fused with the female pro-nucleus whilst the other acted as an independent nucleus, so that at the first division the egg was divided into four cells—led to the same conclusion. For Boveri showed that under these circumstances an abnormal spindle was formed connecting all four daughter nuclei, and on this spindle the chromosomes were irregularly distributed: and that if the four resulting cells were separated and allowed to develop separately they developed abnormally; whereas Driesch[2] had proved that it was possible to rear any of the first four cells into which a normally fertilized egg divides into a perfect larva of diminished size. Since an unfertilized egg has also been induced by appropriate stimuli (*see* EMBRYOLOGY) to develop into a perfect larva, the conclusion is inevitable that one complete set of chromosomes (maternal or paternal) is essential to the normal development, and that cells receiving fewer chromosomes than these cannot grow into normal embryos; hence every kind of chromosome has its appropriate function to play in growth.

Progress since 1910: the Cytoplasm.— If we now turn to the great advances in our knowledge of the cell which were made in the 15 or 20 years ending in 1921, we may direct our attention first of all to the cytoplasm.

About 1899 Hardy published his first paper[3] in which he showed that the effect of the usual preservatives used in killing cells was to produce fibrous networks which had no counterpart in the living protoplasm, for exactly the same effect could be produced by the use of these same fluids on dead proteid: that in fact all colloid solutions, which he termed "sols," could be easily induced to pass into a semi-solid or "gel" phase in which the molecules were arranged in strings. From such networks the intervening fluid could be easily forced out, but by gently heating colloid solutions a different form of "gel" was produced, from which a pressure of several atmospheres failed to force the fluid out. In the first case the fluid contents were called the continuous phase and the fibres the disperse phase—but in the second case the fluid is locked up in tiny droplets inside the semi-solid gelatine and then the fluid was the disperse phase and the gelatine the continuous phase.

This discovery led to great scepticism as to the existence in life of the various structures seen in stained protoplasm. Fresh attention was given to the study of protoplasm in the living state and a most ingenious instrument designed by Kite[4] was used with effect by Chambers[5] for this purpose. This was an excessively fine needle point of hard glass, bent at right angles to the glass tube from which it was drawn, fixed so that the point projected into a glass cell from the roof of which in a hanging drop was suspended the living cell or cells it was desired to explore. The needle could be manipulated by screws and the glass cell was mounted on the stage of a microscope. It was discovered that, generally speaking, the cytoplasm of a cell was a sol which was sometimes very thick and viscid and sometimes more fluid, but that the outer layer next the cell wall was a gel, of which indeed the cell wall might be regarded as an intensification. The various inclusions contained in the central cytoplasm, such as coloured granules, oil drops, etc.—could be freely pushed about by the needle. When, however, the nucleus of the cell approached mitosis, a change took place, and the astral rays were found to be strings of semi-solid material, as were also the mantle fibres of the mitotic spindle: the astral rays became connected with the peripheral gel surrounding the cell. On the other hand no centrosome could be detected in the living cytoplasm, but the sphere surrounding the centrosome was found to consist of fluid material which Chambers supposed to be squeezed out from the cytoplasm during the process of gelatinization of the astral rays, and from it proceeded fluid rays visible as clear streaks in the living cell which alternated with the astral rays. When the spindle divided, the mantle fibres passed again in the centre into the sol state, and this change propagated itself towards the poles as the two daughter cells separated from one another.

Examined in the same way, the cross-striped myonemes characteristic of the muscle cells of arthropods and vertebrates turned out to be composed of alternate discs of gels of different consistencies[6]; but no trace could be made out of neuro fibrillae in the living nerve fibre and the nerve cell, *i.e.* the body of the neuron containing the nucleus when examined in the living condition exhibited Brownian movement—*i.e.* the granules pulsated under the impact of freely rolling molecules—a circumstance which proves it to be in the sol condition.[7] On the other hand it should be recorded that Chambers[8] found that the cytoplasm of the ganglion cells from the central nerve-cord of the lobster was a very viscid substance which could be pulled out into long threads without undergoing essential change. When pulled away from the nucleus a clear empty space appeared on the side of the nucleus in the direction of the pull, which was only slowly filled by inflow of the plasma from the two sides.

It will be observed that in living protoplasm the change from the sol to the gel condition is reversible and very frequently takes place, and many of the phenomena exhibited by living cells will find their explanation in this circumstance. Dr. Gates, professor of botany in King's College, London, has described to the present writer a beautiful demonstration once shown him by Chambers. It consisted of living spermatogorria (immature male germ cells) from the testis of an insect; these when stimulated by the needle could be induced to undergo mitotic division; the chromosomes could be seen like bunches of grapes of a slightly more granular consistency than the rest of the cytoplasm moving along the mantle fibres.

The Brownian movement affords a criterion of whether protoplasm is in the condition of a sol or a gel, although not an absolute one, for Chambers has shown that a sol may be so thick as to prevent this movement and yet it may be possible to move particles in it freely by means of the glass needle. Bayliss[9] has shown that the actively moving pseudopodia of amoeba show a vigorous Brownian movement, but that when

they are caused to retract by electric shocks the movement ends, showing the conversion of the material into a gel.

Side by side with these observations on living protoplasm have gone renewed observations on its structure by means of more refined fixatives and stains. It has been shown that many of the older preserving fluids which were used to differentiate the nucleus and especially the chromatin of the nucleus from the cytoplasm, had a destructive effect in dissolving out many of the constituents of the cytoplasm.

A more refined technique has demonstrated the existence of bodies in the cytoplasm termed "mitochondria," which take the form of fibres or, less frequently, of small oval granules. What their function in the life of the cell is has not been determined. Meves[1] supposed them to be bearers of heredity like the chromosomes and described them as dividing into two at the division of the cell, the halves being distributed to the two daughter cells. Later researches by Gatenby[2] have failed to confirm this. He finds that the mitochondria are irregularly distributed at all divisions. Besides the mitochondria another element of the cytoplasm known as the "Golgi apparatus" has come to light. It is so called because it can be demonstrated only by the Golgi method of preservation and a staining, a method which involves the use of preserving fluids which contain osmic acid, followed by treatment with salts of silver. In young cells this apparatus takes the form of a wreath surrounding the centrosphere or area of clear cytoplasm which envelops the centrosome in the young cell—*i.e.* in the cell just after it has originated by division of the mother cell. During the growth of the cell this wreath dissolves into smaller elements which become scattered throughout the cytoplasm interspersed amongst the mitochondria. These elements in their typical form consist of disc-like bodies made up of a substance which stains faintly, edged for half their circumference by a rim of stains intensely black with the reagents which are used to differentiate the Golgi apparatus. The earlier observers failed to note the disc-like form of these elements and fixed their attention solely on the deeply staining rim, which they regarded as a rod and to which they gave the name "dictysome," but Bowen[3] has brought out clearly the real structure of these bodies. The fact that the Golgi apparatus reacts strongly with osmic acid has been held to prove that it must be partially made up of a substance allied to lecithin, which contains a fat group in the molecule.

The most interesting fact about both mitochondria and the Golgi apparatus is that the elements of both increase in number by transverse division, and hence they cannot be regarded as food reserves, or temporary deposits of excreta, but are in some sense elements of the living cytoplasm. What relation they have to the general metabolism of the cell is not yet clear. Efforts have been made to show that in certain cells they are the centres of fat formation, and in pancreatic cells of the characteristic pancreatic secretion—but these endeavours have not yet carried conviction to the minds of cytologists. Much further work on these lines is needed before certainty can be obtained. In the formation of the spermatozoa of insects and mollusca the mitochondria and the Golgi apparatus play a very definite part which has been elucidated by Gatenby.[4] The former give rise to a sheath surrounding the base of the tail which forms the middle-piece of the spermatozoon; the latter becomes largely metamorphosed into the "acrosome" or pointed structure which is attached to the front of the head of the spermatozoon, and plays the part of a spear-head when the spermatozoon reaches and penetrates an egg. The remnant of the Golgi apparatus migrates round the head and eventually forms a bead projecting from the tail which is eventually rubbed off. The middle-piece penetrates the egg, but undergoes no growth there: it remains embedded in one cell of the embryo and is eventually absorbed so that the mitochondria can have no function as bearers of heredity. In living cells particles resembling mitochondria[5] and Golgi discs[6] in their shape have been observed, oscillating in the typical Brownian manner, whence it is inferred that these bodies really exist as such in living protoplasm and are not merely artefacts produced by preserving reagents.

Nuclear Structure.—As regards advances in our knowledge of nuclear structure, we may note especially the demonstration of the presence of sex chromosomes in many animals. Already before 1915 the fact was known that in certain cases an odd chromosome was present in the ripening germ cells, that is, a chromosome which in one of the ripening divisions of the germ cells passed without dividing to one pole of the mitotic spindle. But Wilson[7] showed that not only are such odd chromosomes found in the developing sperm cells of many insects but that their presence is related to the determination of sex. The odd chromosome sometimes divides like the rest at the first maturation division, but at the second passes undivided to one pole of the spindle. Sometimes it migrates to one pole in the first division and divides like the other chromosomes at the second: in either case its presence causes the formation of two types of germ cell, one possessing one more chromosome than the other. In the case of these insects the ripening eggs are all found to possess the same number of chromosomes: and this number is equal to that found in the sperm cells which have the larger number. It is clear, therefore, that when the eggs are fertilized with the sperm, two types of fertilized egg should be found; one characterized by having one more chromosome than the other, and these eggs should give rise to animals all of whose cells should have nuclei with a number of chromosomes equal to those found in the fertilized egg from which each one arose. If we now examine the cells of the males, it is discovered that they have nuclei with the smaller number of chromosomes, whereas the cells of the female enclose nuclei with the larger number of chromosomes. Therefore it is clear that the male has been produced by the fertilization of an egg by a spermatozoon devoid of the odd chromosome: whereas a female arises when an egg is fertilized by a spermatozoon containing this chromosome.

Wilson showed further that sometimes the odd chromosome has a mate with which it pairs but which is much smaller than itself. This mate is denominated by Wilson the Y chromosome, whereas the large one which alone is present in the case of many insects is termed the X chromosome. The male germ cell which receives the Y chromosome gives rise to a male when it fertilizes an egg. Still other modifications, which lack of space prevent us entering into, are recorded by Wilson. There has been a diligent search for these six chromosomes in the germ cells of other animals, and enthusiastic investigators have announced their discovery in the spermatids of echinoderms, vertebrates and even of man himself. These cases cannot yet be taken as fully proved, mainly owing to the fact that the number of chromosomes in the nuclei of these spermatids is large, and accuracy of count is difficult.

The earlier conception of the preparation for the mitotic division of the nucleus has been that the chromosomes became arranged in a continuous thread termed the spireme, which then became transversely segmented into the characteristic number of chromosomes. This conception has gradually been superseded by a much simpler one, viz. that the chromosomes persist as long looped threads during the resting stage of the nucleus and that these long U-shaped filaments become shorter and thicker as mitosis approaches. To this change of view many workers have contributed, amongst whom we may specially mention Agar[8] and Hogben.[9] The free ends of these U's are attached to a spot on the nuclear wall immediately outside which lies the centrosome. In the preparation for the reducing division of the germ cells, when the chromosomes first become distinguishable they are said to be in the "leptotene" stage. These leptotene threads then approach one another in pairs, and these pairs are termed "zygotene" threads. Each pair fuses to form a single thicker thread known as "pachytene," and *in this way the number of chromosomes becomes reduced to one half.* Though formerly an end-to-end fusion of corresponding chromosomes was strongly believed in, there is to-day no unequivocal evidence that such an end-to-end unison (known as "metasyndesis") ever takes place. On the contrary, in a continually increasing number of cases a side-by-side union ("parasyndesis") has been demonstrated.[10] Lately Hogben has shown that parasyndesis takes place in the cockroach, an insect which has formerly been regarded as presenting the typical case of end-to-end union.

[10] The union of two sister chromosomes in the prophases of the reducing division is frequently termed "synapsis." We have avoided this term because it has also been used to denote the bouquet contraction of the chromosomes (see below).

The pachytene stage is characterized by a great contraction of the chromosomes, which leads to their being gathered up in a characteristic "bouquet" at one side of the nucleus—of course that side adjacent to the centrosome. Then the nuclear wall is dissolved and the chromosomes separate as if repelled from one another: this process is known as "diakinesis." During this process the line dividing the sister chromosomes which paired may reappear, and according to Agar in *Lepidosiren* these chromosomes may entirely separate from one another, only to pair again at a slightly later stage in mitosis. In most cases, however, this complete separation does not take place, but only a partial separation, which leads to the compound chromosome assuming the form of a ring or loop. Each half of the ring corresponds to one of the two original chromosomes, and these halves are dragged apart in the ensuing mitotic division. Most frequently each half shows a constriction in the middle of its length, which was formerly interpreted as a precocious appearance of the longitudinal division of the chromosome which is consummated in the second maturation division. For this reason the name "tetrad" has been bestowed on the shortened, thickened and partially split chromosome. Agar[1] has shown, however, that in the vast majority of cases this constriction has no relation whatever to the splitting of the chromosome in the second maturation division.

Modern theories of heredity assume that a chromosome consists of a linear series of rudiments, each of which has its particular part to play in the up-building of the embryo. A side-by-side pairing enables us to see how corresponding rudiments belonging to maternal and paternal chromosomes are brought together: an end-to-end pairing would of course render such a process impossible.

But the side-by-side union of homologous chromosomes does not always take place in a straight line. In the germ cells of the newt *Batrachoseps* Janssens[2] has shown that one filament becomes spirally wrapped round the other. He believes that he has demonstrated that each filament likewise becomes split longitudinally and that when the two chromosomes separate the now separated chromosomes are no longer the same as those which became united with one another but each has appropriated one strand of the other. Janssens' theory in its extreme form is not accepted by other cytologists; but he certainly has demonstrated cross connexions between the pairing chromosomes, and if the chromosomes are the actual bearers of the hereditary qualities, as seems to be proved from the fact that they alone constitute the head of the spermatozoon, then there are a good many facts (*see* GENETICS) which seem to require for their explanation an interchange of substance between the two paired chromosomes. This is termed by Morgan the "cross-over."

In the ripening of the egg very peculiar phenomena occur which have only recently received an explanation. The unripe female germ cells or oögonia show nothing peculiar in their mitosis, but during the prophases of the first ripening division an enormous increase in size of the egg cell takes place. The leptotene threads are at first clearly visible and can be seen to pass into the pachytene stage, but then they fade from view. The nucleus becomes very large and gorged with nuclear sap, from which circumstance is derived the name, "germinal vesicle," which the older authors bestowed upon it. The nucleolus becomes large and conspicuous. At the close of the growth period the nucleolus has been completely dissolved; the nuclear wall disappears and the nuclear sap mingles with the cytoplasm: then the chromosomes can again be detected as minute tetrads which begin to arrange themselves on the mitotic spindle of the first ripening division. Now by the examination of specially favourable cases it has been shown that what happens during this episode of growth is that the chromosomes swell up, become pressed against the nuclear wall and almost lose their capacity for absorbing stain. It seems to be clear that a chromosome consists of at least two substances—a framework which does not stain and an embedded material which stains intensely, and to which alone the name chromatin is, properly speaking, applicable, and that during the growth of the egg cell the framework swells up enormously. De Baehr[3] has shown that in the male germ cells of the annelid *Saccocirrus*, a similar growth period exists, though it is of very much shorter duration than the corresponding period in the life of the female germ cell, but, short though it is, it is long enough to cause the chromosomes to swell up and temporarily fade from view.

The nucleolus or "germinal-spot" of the older authors, which is so conspicuous a feature in the unripe egg, has formed the subject of some most interesting researches. Hogben has shown that in the cockroach Periplaneta the nucleolus becomes vacuolated and that portions of it are extruded and that these can be recognized by their peculiar staining properties, scattered in the nuclear sap and even in the act of passing through the nuclear membrane. They can also be detected in the cytoplasm outside the nucleus. There seems to be no reasonable doubt that it is by this process of vacuolation and emission of pieces of itself that the nucleolus ultimately disappears.

Gatenby[4] and Hogben[5] have shown that in certain cases these emitted fragments may assume the appearance of nuclei, since they seem to secrete round themselves both nuclear sap and a nuclear wall. Ultimately they all disappear. Though it has not been possible to connect them directly with the formation of yolk spheres, yet it is an interesting fact that the beginning of this emission from the nucleolus coincides with the first appearance of yolk spheres, and as we know by experimental evidence that the nucleus presides over assimilation, it is a reasonable hypothesis that the absorption of these pieces of nucleolus in the cytoplasm leads directly to the synthesis of yolk. It has recently been asserted by Carleton[6] that in ordinary tissue cells where the same disappearance of the nucleolus occurs as the cell grows, this is not complete—that a small kernel remains which can be stained in certain silver salts—and that this kernel takes its place on the mitotic spindle at the next division of the cell. This "nucleolinus," as Carleton terms it, becomes equally divided into two and the halves pass into the two daughter cells. If these observations should be confirmed we should have in the nucleolinus a part of the nucleus as permanent as are any of the chromosomes, the function of which was to form a centre for the synthesis of a mass of chromatin which constitutes the nucleolus and is destined to be emitted into the cytoplasm, where it no doubt profoundly affects the metabolism and determines the formation of cytoplasmic structures.

Parthenogenesis.—We have seen that the normal history of the egg cell is to undergo two ripening divisions, at the first of which the chromosomes are reduced in number by one half. When the egg is fertilized by the spermatozoon not only is the full number of chromosomes restored by the addition of those brought in by the spermatozoon but the division of the egg is initiated by the centrosome which is carried into the cytoplasm of the egg along with the head of the spermatozoon. An interesting question now comes as to what happens in the case of those eggs which develop without fertilization—or, as it is termed, "parthenogenetically."

Now parthenogenesis may be either artificially induced or it may be a natural event in the history of the species. If we take the case of "naturally" parthenogenetic eggs first, we find that a great deal of light has been thrown on the subject by the investigations of de Baehr.[7] He took for his subject the plant-louse *Aphis palmae*, the eggs of which develop without the aid of the male throughout the summer. He shows that in these eggs the preparations for the reducing division occur. Out of the apparently irregular chromatin network leptotene threads differentiate themselves. These pair so as to form thicker pachytene threads—but then at diakinesis these pairs become completely dissociated from one another, and the full number of chromosomes is thus established. Then the period of growth supervenes and the chromosomes become indistinct, but when they reappear in the metaphase they are in the full number and only one maturation division takes place at which all the chromosomes are longitudinally cleft. From these facts de Baehr draws the conclusion that the reducing division is suppressed and only the second maturation division takes place.

A somewhat different case is presented by the egg of the bee. The egg if fertilized gives rise to a female but if unfertilized grows into a male. In the latter case of course the resulting animal has in all its nuclei only the reduced number of chromosomes. When the male produces germ cells, the reducing division is suppressed. The nucleus of the spermatocyte enters on the prophases of mitosis and the cell divides, but one of the daughter cells is devoid of a nucleus and dies. The nucleus in the other cell goes back into the resting stage; and then like the egg in *Aphis*, it enters on a single maturation division in which the chromosomes are divided longitudinally, and the spermatozoon has therefore the same number of chromosomes as that possessed by the nuclei of the tissue cells of the male, which is the reduced number as compared to the number in the nuclei of the cells of the fertilized female.

In still other cases, as in the eggs of the small crustacean *Artemia*, the two ripening divisions may occur, but the first one can give rise to a nucleus which is not extruded as a polar body but remains in the egg and, reuniting with its sister nucleus, restores the full number of chromosomes.

Parthenogenesis can, however, be brought about in eggs which normally require fertilization by the application of external stimuli.[8] This stimulus in the case of the frog's egg may take the form of a prick with a needle. Under these circumstances an immense development of astral fibres takes place, centring on a particle lying

adjacent to the egg nucleus, apparently a centrosome formed from this nucleus. This aster is speedily transformed by division into a short spindle with a radiating aster at each end of it. If this spindle lies near enough to the surface of the egg to initiate a division furrow, parthenogenetic development may begin. It is interesting to observe, however, that the mitotic spindle formed by the nucleus of the unfertilized egg is only $^4/_6$ of the length of the spindle formed by the fertilized egg, *so that the size of the spindle is directly related to the number of chromosomes.*

In the sea-urchin's egg the primary stimulus, which is usually momentary immersion in a fatty acid (such as butyric), only produces an aster on which the chromosomes are distributed but which is unable to metamorphose itself into a spindle. If, however, the eggs are subsequently immersed in "hypertonic" sea water—that is, sea water in which the percentage of salt is raised above the normal amount, then one or more accessory asters are formed in the cytoplasm. Whence the particles arise which act as centrosomes for these asters has never been ascertained; that they have previously been emitted from the nucleus is a pure assumption. If only one accessory aster has been formed a mitotic spindle is formed between it and the aster which arises round the egg nucleus. On to this spindle migrate the chromosomes. A regular equatorial plate is formed, and division of the nucleus and of the whole egg ensues and development is initiated. As the accessory aster is usually smaller than the primary egg aster, the two blastomeres into which the egg divides are of unequal size, and we thus learn that the size of the daughter cells into which a given cell divides is related to the relative sizes of the asters at the two poles of the spindle.

Conclusion.—From the foregoing sketch the reader will gather that the science of cytology had attained in 1921 an extremely interesting stage of development. New discoveries had poured in, the exact significance of which was not yet fully understood, and although we had glimmerings of light they serve rather to pose than to answer questions. What, for instance, is the significance of the mitochondria and the Golgi apparatus? They surely must have some very important function in cell life, for the more research is pushed the wider seems to be their distribution. They have been recorded from Protozoa and from tissue cells of both animals and plants, as well as from eggs and spermatozoa, yet the only function which so far can definitely be assigned to them is the production of transient structures in the ripe spermatozoon. What is the meaning of the centrosome, and how is it related to the formation of astral rays? It cannot be detected in the living cell and yet the study of stained cells would lead us to regard it as a permanent cell organ—typically outside and independent of the nucleus and, like the nucleus, handed on by division from a cell to the daughter into which it divided. Yet, as we have seen, it can be formed *de novo* in the cytoplasm by the action of hypertonic sea water—and Lillie[1] has shown that it can be formed *de novo* from the nucleus. In the fertilization of the eggs of the annelid *Nereis* the spermatozoon penetrates the egg membrane but slowly. Lillie centrifuged eggs in which the head had penetrated but in which the middle-piece with the centrosome were still left outside and he succeeded in tearing away the middle-piece altogether. After the cessation of the centrifugal force the mutilated head completed the penetration of the egg and developed a new centrosome by the emission of a particle from itself which was just as effective in forming the first spindle as the original centrosome.

The astral rays and the mitotic spindle are formed by the gelation of the cytoplasm; yet their formation is dependent on the activities of the chromosomes; for an unfertilized egg responds to stimulation not only by the production of an aster but by the resolution of its chromatin into chromosomes, and the length of the spindle which is formed is dependent on the number of chromosomes.

The nucleus must in some way control the growth of the cytoplasm, and genetic experiments indicate (*see* Genetics) that each type of chromosome has a particular function to play in the building-up of the embryo, yet the only emission from the nucleus which has so far been detected has been that of nucleolar material.

Finally, the constitution of living cytoplasm seems to be normally that of a thick colloid solution, which at times changes to that of the gel condition. It baffles our imagination, however, to conceive how a solution can be the seat of internal structure and how in particular a nerve cell, with all its inherited and acquired aptitudes or "engrams," can be in life nothing more than a thick syrup.

CZECHOSLOVAKIA (*Československo, Československá Republika*).—The republic of Czechoslovakia is a new creation in respect of its name and state-form only. Its modern history as an independent entity begins with the dramatic collapse of the Austro-Hungarian Monarchy at the close of the World War, and the definitive proclamation of Czechoslovak independence on Oct. 28 1918. Some of its constituent territories, however, notably Bohemia and the lands of the Bohemian crown (Moravia, Silesia, Lusatia) enjoyed, up to the year 1620, many centuries of independent existence and played an important, sometimes a dominating, part in the political and religious history of central Europe.

The republic has a pop., according to the census of 1921, of 13,595,818, and an area of about 55,000 sq. m. (approximately the size of England and Wales). It comprises three great natural regions: (1) Bohemia, (2) Moravia and Silesia, (3) Slovakia and Russinia (Sub-Carpathian Russia = *Podkarpatská Rus*). Bohemia, with an area of some 20,400 sq. m., has a pop. of 6,664,932; Moravia, with 8,600 sq. m., 2,660,737 inhabitants; Silesia, 1,800 sq. m., and 670,937 inhabitants; Slovakia, 20,000 sq. m., and 2,993,479 inhabitants; Russinia, 5,000 sq. m., and 605,731 inhabitants. The whole is about 600 m. long and has a maximum breadth of 185 miles. In respect of population it occupies the tenth place among European countries; in respect of size the fourteenth place; in density of population the seventh.

The frontiers were fixed by the Peace Treaties of St. Germain, Versailles and Trianon, while a portion of the ancient principality of Těšín (Teschen) was adjudicated to it by the Paris Conference (July 1920). On the W. and N., where it borders upon Bavaria, Saxony, Prussia and Poland, it is enclosed by mountains, some of them of very considerable height, which form on those sides a natural and strategic frontier. In Bohemia the highest peak Sněžka (Schneekoppe) has an altitude of 5,216 ft., in Slovakia the summits of the Carpathians and of the High Tatra rise to a height of between 7,000 and 8,000 ft. South of these ranges lie fertile and well-watered plains and lowlands extending to the borders of Austria, Hungary and Rumania. Some 60% of the entire area of the republic is included in the basin of the Danube, the rest being traversed by the Labe (Elbe) and the Vltava (Moldau), the former passing in particular through regions remarkable for their rich fertility. Some one-third of the entire surface of the country is covered by forests. The climate of the republic is a medium between a maritime and continental one.

Prague, the capital (677,000 inhabitants), is picturesquely situated on the Vltava and justly famous for its architectural beauty. Bratislavá (Pressburg), the capital of Slovakia, with its great Danubian harbour, is the gateway of central European trade to the East and the Balkans. Other towns of importance in the republic are Brno (Brünn), with 200,000 inhabitants, the capital of Moravia, and the centre of an old established and flourishing textile industry; Plzeň (Pilsen) with 100,000 inhabitants, famous for its beer and as the seat of the Škoda iron works; Košice (Kaschau), the commercial centre of eastern Slovakia; and Užhorod (Ungvár), the capital of Russinia. Of German towns in Czechoslovakia (most of them with a considerable Czechoslovak minority), Liberec (Reichenberg), and Jablonec (Gablonz), are important industrial centres. Carlsbad (Karlovy Vary), and Marienbad (Mariánské Lázně), are famous spas. Czechoslovakia indeed is one of the richest states of Europe in mineral and health-giving waters, and possesses more than 200 watering places and health resorts. Besides Carlsbad and

Marienbad, Franzensbad, Teplice (Teplitz), Poděbrady (in Bohemia), Luhačovice in Moravia, Piešťany, Trenčianske Teplice, Sliač and Štrbské Pleso (4,100 ft. above sea-level) in Slovakia, are noted. At Jáchymov (Joachimsthal), in North Bohemia, radium is produced.

Ethnology.[1] —The population of Czechoslovakia is ethnologically of a mixed character. The prevailing element is that of the Czechs (7 millions), with whom the Slovaks (2½ millions) form one people; indeed as long ago as the 9th century the kingdom of Great Moravia, with frontiers roughly identical with the present boundaries of the Czechoslovak Republic, was the creation of the Slav people, who occupied in common a territory stretching from W. Bohemia to the Carpathians.

The Czechs and the Slovaks, or, to give them their united name, the Czechoslovaks, are a branch of the great Slav family of which the Russians are the most numerous and the most important member and to which the Serbo-Croats with the Slovenes, the Poles, the Bulgarians and the Wends of Germany also belong. Even after the conquest of Slovakia by the Hungarians, which resulted in Slovak territory being separated from Czech territory till they were reunited in 1918, an intellectual connexion between the two branches of the one family was always maintained, and some of the foremost names in Czech literature are those of writers who were Slovaks by birth. The difference between the Czech language and the language spoken in Slovakia is merely dialectical and the struggle for independence, culminating in the declaration of the Czechoslovak State, has emphasized and developed the sentiment of Czechoslovak unity. It is not without interest to note that the three principal leaders of the movement for independence were a Moravian of Slovak descent (Masaryk), a Slovak (Gen. Štéfanik), and a Czech (Dr. Beneš).

Of the non-Czechoslovak races in the republic the Germans are the most numerous, numbering some 3½ millions, chiefly dispersed along the W. and N. frontiers of Bohemia and in Moravia and Silesia. Their presence is largely the result, firstly of a colonization which was favoured by the Bohemian kings and princes of the 12th and 13th centuries, and secondly of a policy of Germanization pursued by the Habsburg rulers from the date of the battle of the White Mountain in 1620 (when the Czechs lost their independence) up till the very close of the World War.

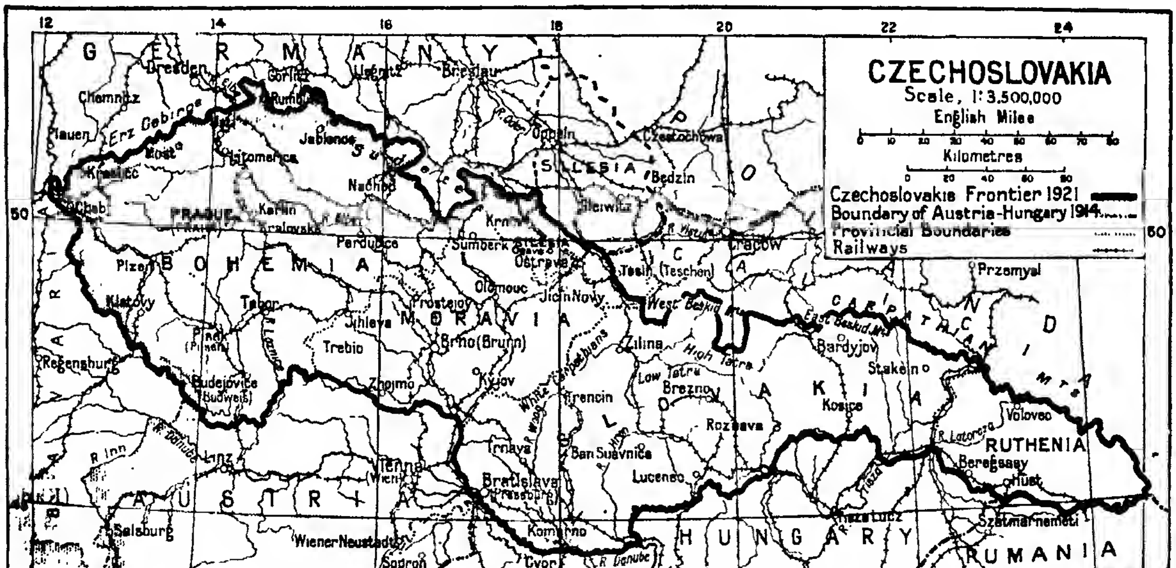
On the day following the attainment of Czechoslovak independence, Oct. 29 1918, the Germans of Bohemia and Moravia—the so-called Sudetenland Germans—declared the districts where they predominated a province of the new Austrian State, which had been constituted some eight days previously. It was not until the Treaty of St. Germain was concluded on Sept. 10 1919 and the Austrian Government released the Germans from the oath of allegiance they had taken to the new Austrian Republic, that the Germans desisted from openly fighting against incorporation in the Czechoslovak Republic. Their claim to self-determination was rejected by the Peace Conference. From the mere presence of the Germans within the historic frontiers of the Czechoslovak State it would indeed have been difficult, with justice, to deduce a right of self-determination, that is to say, the right, in this case, of retaining all the fruits of misused power. In Slovakia the Slovaks were subjected to a similar system of Magyarization. The Hungarian census of 1910 purported to show that in Slovakia there were 1,697,552 Slovaks and 901,793 Hungarians. The correct figures, however, were shown by the census of 1919 to be Slovaks 2,141,000, Hungarians 665,000.

Other nationalities occupying portions of the Czechoslovak Republic are Ruthenians 600,000 and Poles 250,000. On the other hand there are some 500,000 Czechoslovaks in Austria, 450,000 in Hungary, more than 200,000 in Yugoslavia and Rumania, and over 800,000 in America.

Special provision is made in the Constitutional Charter of the republic (in accordance with the terms of the Treaty of St. Germain) for the protection of national, religious and racial minorities. Difference in religious belief, confession or language, constitute no obstacle to any citizen in regard to entry into the public services or offices, to the attainment to any promotion or dignity, or to the exercise of any trade or calling. In towns and districts in which there lives a considerable section (20% or more) of citizens speaking a language other than Czechoslovak, schools are to be provided, the instruction to be imparted in the language of that minority. Such a minority has also a right to a proportionate amount of the funds set aside by the State or by the local authorities for purposes of education, religion or philanthropy. The courts of justice and the public offices are also required to pay due regard in respect of language to the desires of a minority which numbers at least 20% of the inhabitants of the locality. Every act tending to force a citizen to abandon his nationality—in other words oppression of a citizen on account of his race—is expressly prohibited.

Creation of the Republic.—When in July 1914 Austria commenced hostilities against Serbia, thus bringing about the World War, this act of aggression took place against the will of the Czechs and Slovaks, at that time subject to Austrian and Hungarian rule respectively. Open protest or organized revolt, however, was impossible owing to the proximity and indeed the presence in overwhelming numbers of German and Hungarian troops, who were expressly garrisoned among the Czech population in order to stifle any possible outburst of national and pro-Ally sentiment. Direct political action was equally impossible, as the Austrian Parliament was suspended. Whenever opinions did happen to be expressed which could be construed as criticism of Austria or Germany the offenders were speedily punished, and it was not long before the political leaders of the Czechs and Slovaks found themselves in confinement, some of them under sentence of death, while the Czech and Slovak press was subjected to a rigorous censorship and many of its organs prohibited from appearing. Some of the political leaders escaped over the frontier—among them Prof. Thomas Garrigue Masaryk and Dr. Eduard Beneš, who were subsequently to lead a success-

[1] For an Austrian view of the nationality question, *see* the article AUSTRIAN EMPIRE (Ed. *E. B.*).



ful campaign abroad for the destruction of the Austrian Monarchy and the attainment of Czechoslovak independence.

The persecutions, sometimes revolting in their cruelty, to which (on account of their pro-Ally sympathies) the Czechs were subjected during the first two years of the war, had the effect of uniting all the different political parties into one single national block; and when the Austrian Parliament was at length convoked in May 1917 the Czech parties made a unanimous declaration that it was their aim to work for the union of Czechs and Slovaks as one people in an independent state.

As the war proceeded, further declarations of national and anti-Austrian sentiment were made, the most notable being the "Twelfth Night Manifesto," issued at Prague on Jan. 6 1918, in which all the Czech deputies of the Austrian Reichsrat and of the Diets of Bohemia, Moravia and Silesia unanimously demanded full independence and representation at the future conference which should conclude peace in Europe.

Meanwhile the Czechs, who were as Austrian subjects obliged to serve in the Austrian army, lost no opportunity of passing over to the Allies. Of 70,000 prisoners taken by Serbia early in the war 35,000 were Czechs. Of these 32,000 perished during the Serbian retreat or died of fever or cholera. The remnant, 3,000 in number, proceeded to France and there joined the Czechoslovak legions already fighting on the French front. Of a total of 600,000 Czech troops in the Austrian army over one-half surrendered to the Allies. In Russia a Czechoslovak legion was formed at the outset of the war, and later this grew into a regular army which by 1918 numbered 100,000 men.

The activities of Prof. Masaryk in Russia, England and America, enthusiastically supported by his compatriots living abroad, and especially by the Czechs and Slovaks who had emigrated to the United States, the self-sacrificing valour of the Czechoslovak legions on the French, Italian and Russian fronts, and the work of the Czechoslovak Council with its headquarters at Paris, moved the Allies to acknowledge the last-named body as the *de facto* Provisional Government of the Czechoslovak State. On July 13 1918 a Czechoslovak National Council, representing all parties, was formed at Prague as a complement to the National Council already existing at Paris. This was the first direct step taken at home towards the establishment of the new State.

On Aug. 9 1918 the British Government issued the following declaration:—

"Since the beginning of the war the Czechoslovak nation has resisted the common enemy by every means in its power. The Czechoslovaks have constituted a considerable army, fighting on three different battle-fields and attempting, in Russia and Siberia, to arrest the Germanic invasion. In consideration of their efforts to achieve independence, Great Britain regards the Czechoslovaks as an Allied nation and recognizes the unity of the three Czechoslovak armies as an Allied and belligerent army waging a regular warfare against Austria-Hungary and Germany. . . ."

This declaration materially helped to seal the fate of Austria, and implicitly recognized Czechoslovak independence as an accomplished fact. France and Italy, by accepting the assistance of Czechoslovak legions on the French and Italian fronts, had already practically acknowledged Czechoslovakia's claims (Briand, 1916). In the first week of Sept. 1918 the United States of America and Japan issued declarations practically endorsing the British declaration. On Oct. 14 1918 the Czechoslovak National Council was constituted as a Provisional Government with all the attributes of sovereign and independent power. On Oct. 17 the Austrian Emperor Charles issued a manifesto offering the various nationalities of his empire a measure of autonomy on the basis of an Austrian federation. The offer was too partial and came too late. Austria's hour had struck. The Czechs at home declined even discussion with the Vienna Government, and declared that the question of Czechoslovakia must be left to the Peace Conference. On the 18th the Provisional Government at Paris issued a declaration of independence, signed by Prof. Masaryk, Dr. Beneš and Gen. Štéfánik. On Oct. 27 the Austro-Hungarian Government recognized the rights of the Czechoslovaks, and cabled to President Wilson at Washington a request for an armistice and peace negotiations.

Thus, on Oct. 28 1918 the Czechs regained the independence which they had lost almost 300 years before, at the ill-fated battle of the White Mountain on Nov. 8 1620. The National Council at Prague issued a proclamation of independence and took over the reins of government. In spite of the presence of Austrian and Hungarian garrisons in Prague and other towns, there was no bloodshed. Every consideration was shown to the Imperial troops and the Imperial civil authorities, who were allowed to vacate their posts without being subjected to force, and the universal rejoicings of a liberated people were happily marred by no scenes of violence.

On Nov. 16 the first representative body of the Czechoslovak people—the National Assembly as it was called—met at Prague. Its members, 236 in number, were selected from all the different political parties in proportion to their strength as shown by the last parliamentary election previous to the war. The Assembly proceeded to decide upon the form of government to be adopted. The unanimous decision of the Assembly was in favour of a republic, and Prof. Masaryk, at that time still absent abroad, was unanimously chosen as first president. A Cabinet was formed, with Dr. Kramář, who during the war had been sentenced to death for treason and afterwards reprieved, as premier, and Dr. Beneš as foreign minister.

Two days after the declaration of the independence of the Czechoslovak State, which had been signed also by the representatives of Slovakia, the Slovak National Council issued a "Declaration of the Slovak nation," wherein it was solemnly set forth that the Slovaks in blood, in language and civilization form part of the Czechoslovak nation. A considerable time, however, elapsed before the Slovaks were allowed without hindrance to unite fully with the Czechs. The Hungarians (Magyars) declined to surrender the territories inhabited by Slovaks, and it was necessary to call in the military help of the Czechs before the last Hungarian troops, who had initiated a reign of terror in Slovakia, could be driven out of the land.

In the extreme eastern corner of the Czechoslovak Republic, there is situated a little autonomous region of Russinia (or Sub-Carpathian Russia), which, together with Slovakia, was part and parcel of the Hungarian Kingdom till the Treaty of St. Germain permitted its incorporation with Czechoslovakia. The National Central Council of the Ruthenians, which met on May 8 1919 at Užhorod, their capital, unanimously adopted a resolution approving of incorporation with Czechoslovakia, on special terms of autonomy. Thus by the express will of their peoples, the various lands represented in the Czechoslovak Republic, viz. Bohemia, Moravia, Silesia, Slovakia and Russinia, united to form one State with a single central Government having its seat at Prague. The tasks, almost infinite in number, confronting the new State were of great gravity. The country had been brought by the Austro-Hungarian war policy to the very brink of economic and financial ruin. A starved and decimated population stood face to face with difficulties, not only on every frontier but indeed to some extent within the borders of the State itself. The spirit of courage and endurance which had enabled the Czechoslovaks to achieve their independence was now to inspire a further work of no mean significance—the consolidation of a free, democratic and enlightened republic in the heart of Europe, the most westerly outpost of the great Slavonic world stretching from the banks of the Elbe and the Danube to the Pacific Ocean, and at the same time a nation bound by ties of gratitude and common interest to the Anglo-Saxon and Latin races. "At home we feel sufficiently confident," said Dr. Kramář, the premier, at the first session of the National Assembly, "of being able to rely upon our own powers alone, and that without injustice to others. We shall count upon the devotion of all towards the State and we shall show that not only have we been able to achieve our liberty but that we know how to preserve it and to be really free—worthy of our great past, of our traditions and of our sufferings."

The National Assembly confirmed all the emergency measures which had been passed by the National Council between Oct. 28 and the date of the first session of the Assembly, such for

instance, as enactments declaring the Austro-Hungarian code of laws (with some few express exceptions) as still in force and measures securing continuity in the executive and administrative offices of State. There was thus no appreciable break in political, legal or local administration. The framing of a constitution for the new State was early proceeded with. On Feb. 29 1920, after a parliamentary committee had been at work on its provisions for almost a year, a constitution of the republic was adopted by the National Assembly.

Constitution.—The framers of the constitution were largely influenced by the American and French constitutions, and the American principle of the division and balance of the legislative, executive and judicial powers was followed.

The actual terms of the constitution are introduced by a preamble, which runs:—

"We, the Czechoslovak nation, desiring to consolidate the perfect unity of our people, to establish the reign of justice in the Republic, to assure the peaceful development of our native Czechoslovak land, to contribute to the common welfare of all citizens of this State and to secure the blessings of freedom to coming generations, have in our National Assembly this 29th day of February 1920 adopted the following Constitution for the Czechoslovak Republic. and in so doing we declare that it will be our endeavour to see that this Constitution together with all the laws of our land be carried out in the spirit of our history as well as in the spirit of those modern principles embodied in the idea of Self-determination, for we desire to take our place in the Family of Nations as a member at once cultured, peace-loving, democratic and progressive."

Legislative authority is exercised by two popularly elected bodies, a Chamber of Deputies of 300 and a Senate of 150 members. Of these, the Chamber of Deputies, as the more fully representative of the popular will, possesses greater powers, being enabled in certain cases to carry through its legislation in face of the opposition of the Senate. The Senate was intended to play the part of an organ of supervision, so as to act as a preventive of too hasty or too loosely drawn-up legislation. It has in more than one instance already exercised its power as a checking and restraining authority with good effects—its amendments even on substantial points having been several times accepted by the Lower Chamber.

Suffrage is universal, both men and women who have attained the age of 21 years being able to vote in elections to the House of Deputies. To vote in elections to the Senate the voter must have reached the age of twenty-six.

The president of the republic is elected in a joint session of the two Chambers. His period of office is fixed at seven years, and he may be reëlected at the end of his first term for a second period of seven years. For a third term, however, he cannot be elected until after the expiration of seven years from the conclusion of his second term of office. This restriction does not apply to the first president—President Masaryk.

The president of the republic is not answerable at law for his official acts. He may be impeached in one case only—namely, for high treason, on the motion of the Chamber of Deputies; and his only punishment, if found guilty, is the loss of his office and disability ever to hold it again. For each and all of his State acts one minister at least is responsible.

Among other outstanding terms of the constitution are the following:—The Czechoslovak State is declared to be a democratic republic with an elected president at its head. To make any alteration in its frontiers a constitutional law is required—a law which, as opposed to an ordinary law, has to be passed by a three-fifths majority of Parliament. Russinia (Sub-Carpathian Russia) is granted the widest possible autonomy compatible with the integrity of the Czechoslovak Republic. The Chamber of Deputies is elected for six years, the Senate for eight. Deputies must be at least 26, senators 45 years of age. They possess immunity, but may be handed over to the ordinary courts by resolution of the House to which they belong. Parliament must sit twice a year. Declarations of war and amendments to the constitution require a vote in their favour of three-fifths of all members of both Houses. Cabinet ministers may participate in the meetings of either House and on the request of either House must attend its session.

Finance and army bills must be introduced first in the Lower House, the Chamber of Deputies. A measure passed by the Chamber of Deputies becomes law, in spite of its rejection by the Senate, if the Chamber of Deputies by a vote of the majority of its entire membership repasses the measure.

During the period when Parliament is not sitting, a permanent commission of 24 members (16 from the deputies and 8 from the senators) sits to enact urgent measures which have temporarily the force of law. They lose their validity unless confirmed within two months by the Parliament which subsequently meets.

Cabinet ministers are appointed by the president; they need not be members of either House.

In respect of civic rights no privileges of sex, birth or vocation are recognized. Titles may be conferred only when they refer to office or occupation The liberty of the press, the right of free expression of opinion by word, writing, printed matter, etc., liberty of conscience and religious profession are guaranteed. All religious confessions are equal before the law.

All citizens of the republic are fully equal before the law and enjoy equal civil and political rights whatever be their race, language or religion; the special provisions for the protection of national and other minorities have already been referred to. The constitutional charter thus represents an honest effort to set up a truly democratic republic which shall fairly meet the demands of the varied races and religions within its borders.

Administration and Justice.—The executive Government is placed in charge of 15 ministries concerned with the following matters:—foreign affairs, interior, finance, commerce, labour, food supplies, railways, health, social welfare, justice, agriculture, public instruction, national defence, posts and telegraphs, and the unification of laws. The collective responsibility of this Cabinet of ministers is expressly laid down in the charter of the constitution. The president of the republic enjoys such executive power as is expressly assigned to him by the constitution, and he has his own office—the president's bureau ·presided over by a permanent official, to conduct such matters as fall within his competence and to facilitate communication with the rest of the executive.

For purposes of political administration the republic has been divided into administrative subdistricts, the heads of which are appointed by and directly responsible to the central Government. Local civil government is carried on by popularly elected parish, district, urban and municipal councils.

The tribunals of the republic are the Supreme Court of Justice, which sits at Brno and is the court of final appeal both in civil and criminal causes, two high courts sitting at Prague and Brno respectively, 33 provincial courts and 410 district courts, all of which possess jurisdiction in both civil and criminal causes. Commercial cases are dealt with by the ordinary courts, except at Prague where a special commercial court sits. Litigation in mining matters is conducted before special benches attached to the district courts in mining districts. In large industrial centres there are also industrial courts to deal with disputes between employers and workpeople. At Prague there sits also an electoral court which decides upon the validity of disputed elections or forfeiture of seats and other questions relating to parliamentary or elected bodies. A constitutional court decides whether laws promulgated by Parliament are in harmony with the charter of the constitution.

Previous to 1918 the territories now composing the Czechoslovak Republic were of course subject to the Austrian or Hungarian code of laws respectively. On the collapse of the Austro-Hungarian Monarchy the Austrian code was adopted for the lands of the Bohemian crown and the Hungarian code for Slovakia. A special Ministry—that for "the unification of legislation and administrative organization"—has been entrusted with the unification of the laws for the whole republic; and two commissions of legal experts under the control of the Ministry of Justice were in 1921 at work on a careful revision of the old codes, which when completed would be issued as a uniform code for the entire republic.

Foreign Policy.—"Our policy," said Dr. Beneš in 1921, "is a policy of peace: in domestic affairs our programme is the logical sequel to our foreign policy, namely, social and racial order and justice, and unremitting effort on behalf of social and political democracy. The Great War must have taught us all that a calm and sensible discussion of all our differences is possible." The Czechoslovak Republic was first and foremost concerned, while avoiding all that may smack of chauvinism or imperialism, to maintain its integrity within the frontiers assigned to it by the Peace Conference. To that end it insisted upon the strict observance of the Treaties of Versailles, of St. Germain and of Trianon. It favoured an Anglo-French entente or alliance, seeing therein a substantial guarantee for the due carrying-out of those pacts. An intimate collaboration with England and France was a *conditio sine qua non* for Czechoslovakia. The creation of the so-called "Little Entente," aiming at the preser-

vation of the *status quo* in central Europe, was the primary outcome of Czechoslovak foreign policy. Czechoslovakia, Yugoslavia and Rumania became bound together in the Little Entente by a treaty of alliance (Convention with Yugoslavia dated Aug. 13 1920, with Rumania April 23 1921), positive in so far as it aimed at the establishment and maintenance of peace, security and normal economic conditions in central Europe, and defensive in so far as it was directed against all attempts at reaction menacing the existence of the new states. The efficacy of the Little Entente as a counter-reactionary alliance was manifested in April 1921, and again in October 1921, when its concerted action helped to frustrate the two attempts of Charles of Habsburg-Lorraine to recapture the throne of Hungary.

In respect of Austria Czechoslovakia was animated by the desire to assist in relieving the economic situation of the country, while opposed both to the incorporation of Austria with Germany and to the foundation of a Danubian confederation. It was in favour of aiding Austria on a broad basis of financial and economic help, to be rendered generally to the states of central Europe by international agreement. It was in favour of creating in central Europe a new political and economic system by which permanent peace would be secured—a definite understanding between all the "Succession States" of the former Austro-Hungarian monarchy in the matter of communications, post, telegraphs, navigation, finance and banking, exchange of goods and commercial treaties generally, opening up the way to a system of unfettered economics and freer trade—but at the same time jealously guarding the economic and political sovereignty of the Czechoslovak Republic.

In respect of Hungary Czechoslovakia was at one with Yugoslavia and Rumania in holding that a Habsburg restoration would be a *casus belli*. These countries adopted the view laid down by the Paris Conference on Feb. 2 1920, which declared that "it is not within the intention nor can it be regarded as the duty of the principal Allied Powers to intervene in the internal affairs of Hungary or to dictate to the Hungarian people what form of Government or of Constitution they shall adopt: nevertheless the Powers cannot allow the restoration of the Habsburg dynasty to be regarded as a question concerning the Hungarian nation alone. They declare therefore that a restoration of this nature would be in conflict with the very basis of the peace settlement and would be neither recognized nor tolerated."

On the other hand Czechoslovakia was desirous of renewing economic and political relations with Hungary, the more so as agricultural Hungary might be regarded as the complement of industrial Czechoslovakia, supplying her with natural products and providing a market for Czechoslovak manufactures.

With Poland the relations of the Czechoslovak Republic were for a considerable time seriously troubled by the question of Teschen, both countries laying claim to that territory. The Paris Conference in July 1920 decided for the partition of the disputed area; and the decision, though it signified no small sacrifice for the Czechoslovaks and caused deep disappointment throughout the country, was accepted loyally in the hope that by this sacrifice the friendship of the Poles would be secured. In the words of Dr. Beneš, "the Czechoslovak Government regards the conflict with the Poles as definitively ended and is desirous of systematically pursuing a policy of *rapprochement*." It was in this sense that the whole policy of Czechoslovakia towards Poland was directed, and the Czechoslovaks were hopeful that Poland would ultimately join with the Little Entente.

Towards Russia the policy of Czechoslovakia was logically consistent. It had always been opposed to intervention in Russia, and insisted upon Russia desisting from any act that might be construed as intermeddling in the affairs of Czechoslovakia, in particular the pursuit of Bolshevist propaganda on Czechoslovak territory. The Czechs were animated with intense sympathy for the real Russian people, and looked forward to the day when they will be able to coöperate as kinsmen in the reconstruction of a peaceful and well-ordered Russia.

In pursuance of its practical policy of *rapprochement* and economic coöperation in the reconstruction of central Europe in particular and of Europe in general, Czechoslovakia concluded a series of commercial treaties with her various neighbours and with the Allied Powers.

Political Parties.—Not only was there in 1918–21 a sharp contrast in policy between the Czechoslovaks and the minority races living within the republic—the Germans and the Magyars—but each nationality was split up into a multiplicity of factions. The Czechoslovaks had 199 representatives in the House of Deputies and 103 in the Senate, and this total of 302 members was divided among no less than nine parties. The Germans and the Magyars were also proportionately split up. The strongest party in the republic was that of the Czechoslovak Social Democrats, which up to Sept. 1920 was represented by 74 deputies and 41 senators. The left wing of the party,—22 deputies and 5 senators—after a somewhat violent quarrel, then broke away and formed an independent organization owing allegiance to the Third (Moscow) International. This Communist party established its own organ, the "*Rudé Právo*" (The Red Rights), in opposition to the "*Právo Lidu*" (The Rights of the People), the organ of the Social Democratic party. The Social Democrats were well organized among the industrial workers and agricultural labourers. They pursued a Marxist programme aiming at the socialization of the State, the means of production and consumption: they were opposed to a dictatorship of the proletariat, and were for evolutionary as opposed to revolutionary methods. They supported the peace policy of the Czechoslovak Government in foreign affairs, and were strongly opposed to intervention in Russia. They were also in favour of a closer coöperation with the German democratic element in the State.

The Communists aimed at a dictatorship of the proletariat, the creation of workmen's and military councils and a close hand-in-hand coöperation with Soviet Russia.

The Popular party, composed of Catholics and recruited largely from Slovakia and the country districts of Moravia, was represented by 33 deputies and 18 senators. Its organization was chiefly in the hands of the priests. It championed the rights of private ownership against Socialism, and combated the anti-Rome movement which was taking place throughout the republic. In foreign affairs it supported the Government.

The Agrarian party numbered 42 members, and published an important daily, the "*Venkov*" (Country). It was drawn from the peasant and small-farmer class, was in favour of land reform, private property rights and increased production all round. It was opposed to Socialism.

The National Socialists numbered thirty-four. They pursued a national as opposed to an international social policy, being thus opponents of the Social Democrats and in particular antagonistic to Communism. They were opposed to the Soviets, but while favouring a constitutional Russia were against any intervention in that country.

The National Democrats (Liberals), whose organ was the "*Národni Listy*," numbered twenty-nine. They were led by Dr. Kramář, and, being mostly recruited from the educated, professional and official classes, were more influential than the numbers suggest. They were strongly represented in Prague and other cities. They were, of course, opposed to Marxism and Communism. In domestic politics they were strongly Nationalist and suspicious of the Germans. They were the champions of State authority, order and public morals.

Of the German parties the strongest was again the Social Democratic party, originally numbering 31 deputies and 16 senators, but having subsequently lost three deputies who formed a German Communist party acting more or less in concert with the Czechoslovak Communists.

In 1921 the total number of Socialists of every complexion in the House of Deputies was 141, as opposed to 137 Bourgeois members (Czechoslovaks 199, Germans 72, Magyars 7). In the Senate the Socialists numbered 68, as against 75 Bourgeois members (Czechoslovaks 103, Germans 37, Magyars 3).

The composition of the Chambers sufficiently explained the fact that up to Sept. 1921 the Government of the republic had

remained in the hands of a Coalition Cabinet, or (as at the latter date) of a Cabinet composed of permanent officials supported by a coalition of parties.

Social Legislation.—The democratic sentiment of the Czechoslovak nation, and its maturity in social matters, resulted in the adoption of a social policy which, while proceeding without undue haste, was characterized by a comparatively rapid course of reform. Social legislation first took the form of accident and sickness insurance. In respect of the former an increase of 30% in the payments to the insured as compared with July 1 1917 was made, while at the same time better terms were given in the insurance of miners and of railwaymen; insurance against sickness was completed by extending it to agricultural and domestic workers as well as to the families of the insured. In addition to this, in the course of fixing the premiums to be paid, the amount of State support was several times increased. Sickness insurance was made to include maternity insurance. Old-age and invalidity pensions were not universal; they were made to apply, outside civil servants, to clerks and private officials only.

Pensions were also secured to the widows and orphans of the assured. A universal scheme of old-age and invalidity insurance was before Parliament in 1921. Pensions for war invalids had been granted by special enactments. Insurance against unemployment was originally introduced as an emergency measure, but the economic conditions following the war necessitated the maintenance and extension of this form of insurance, which for normal times has been given legal sanction according to the Ghent system, by State contributions to the payments made by the trade unions.

The most notable accomplishment of the young republic in the field of social-political reform has been the enactment of Dec. 19 1918 establishing an 8-hour day for industrial and agricultural workers (with some specific exceptions). Prohibitions in respect of night work, the work of women (especially mothers) and young persons have been dealt with in the sense of the resolutions adopted at international conferences.

Wages have also been the subject of legislation; special commissions have been empowered to regulate the wages in the so-called "home" industries (sweating), and an arbitration board has been appointed to fix the salaries of clerks in the metal industry, thus minimizing the danger of conflicts in respect of wages having to be settled by means of strikes.

By a far-reaching policy an attempt has been made towards solving the housing problem. A special enactment protects tenants against arbitrary treatment at the hands of landlords in respect of notice to quit and raising of rents. Numerous enactments have also been passed for the encouragement of building operations. The State grants generous support to local authorities and to coöperative societies. These grants amounted in 1919 and 1920 to more than 625,000,000 crowns.

A vast measure of freedom, compared with their position under the Austrian régime, has been granted to women both politically and socially. Politically women are now the equals of men, and there is nothing legally to prevent a woman occupying any position in the various professions or in the administration of the State. In the two Houses of Parliament they were represented in 1921 by 16 members.

Nationalization of the coal-mines and the great industrial concerns was one of the main items on the programme of the Socialist parties. In practice moderate discussion was still proceeding in 1921 with the view of giving a more democratic character to factories and other undertakings and assuring a closer coöperation of the workers in the management. In regard to the mines specialists were in conference as to the part to be taken by the State and by public bodies in ownership and management. A first step towards democratizing industrial undertakings was taken by an enactment touching mining councils. By this enactment it is made possible, where more than 20 workers are employed, for an elected council to coöperate in securing the welfare of the workers, to see to the due execution of contracts and agreements, to settle disputes, and to take part in the management of philanthropic institutions.

Another enactment assures to miners a 10% share of the net profits, this sum to be employed for educative, philanthropic, or other purposes of utility for the benefit of the miners.

On the principle of the mining councils, factory or industrial councils were projected for all industrial undertakings.

The idea underlying these councils was to create, as it were, a certain constitution for factories by which the workman who had hitherto been a mere machine should become a creative factor, closely identified with the organization of the undertaking, conscious of responsibility, and thus making of democracy the same reality in economic life as it had already become in political life.

Land Reform.—Long before the political revolution of 1918 the Czechoslovaks had been convinced of the necessity for a far-reaching measure of land reform, both from a social and economic point of view as well as from national considerations. Vast entailed estates were the property of a small group of landlords (in Bohemia 37·7%, in Moravia 34·4%, in Silesia 39·9% of all land belonged to owners representing 0·1% of the population), while great masses of the people did not own a single acre of their native land. The great majority of the landlords were nobles of foreign origin who acquired their estates at the hands of the Habsburg conqueror from 1621 onwards, when, after the battle of the White Mountain, the lands of the Czech nobles and yeomen were confiscated, the owners being executed or, as adherents of the Moravian Brotherhood and other Protestant churches, preferring to pass into exile rather than surrender their faith. The demand for the nationalization of the great landed estates was thus not only supported as a social and economic necessity in order to provide the landless population, notably the legionaries, with land, but was, deep in the minds of the people, regarded as a legal rectification of the wrongs suffered through the confiscations which followed the defeat of the White Mountain.

The Act by which the great estates were sequestered was unanimously passed by the National Assembly on April 16 1919. It gives the State the right to "take" (seize) and distribute estates in so far as they exceed 150 hectares (370 ac.) of arable land or 250 hectares (617 ac.) of land of any kind. Estates belonging to the house of Habsburg-Lorraine, property illegally acquired, as well as the property of persons who during the war were guilty of gross offences against the Czechoslovak nation are taken for a compensation paid to the Reparation Commission at Vienna. In all other cases the State gives to the owner a proportionate compensation based on the average prices in the years 1913–7. For the purchase and distribution of the land a "*State Land Office*" has been set up. A share in the distribution may be claimed on the one hand by private persons to the amount of 15 hectares (37 ac.)—the amount suitable for cultivation by one family; on the other hand by agricultural, housing and coöperative societies. The lands taken over by the State may, of course, be used for other purposes of public utility and remain the property of the State. Even persons without means may obtain land, an enactment enabling them to purchase on credit to the extent of nine-tenths of the value of the land acquired. Special protection is given to small holders. This Land Act was to be carried out in a series of successive periods, during the first of which only estates over 5,000 hectares (12,350 ac.) would be affected.

The Army.—The military forces of the republic were organized, immediately on the attainment of independence, on a democratic basis. The army was formed of the legionaries who had fought in Russia, France and Italy on the side of the Allies, and of those Czechoslovak troops who, on the collapse of Austria-Hungary, streamed back from the various fronts. Recruits now serve for two years, and the strength of the army is fixed at 150,000. This force, which is in essence a militia, is designed to be something different from a mere fighting machine. During their term of service the men are given not only military training but also educational advantages, as well as the opportunity of learning some handicraft. Well-organized continuation schools and systematic courses of lectures aim at providing the young soldier with a complete adult education. The Sokol societies, in collaboration with the army gymnastic clubs and with the Y.M.C.A., devote themselves systematically to the physical and moral welfare of the troops.

Education.—In Bohemia, Moravia and Silesia the standard of education—elementary higher and technical—is excellent, and there are practically no illiterates—a state of affairs attributable to the interest which the Czech nation (imbued with the traditions of Comenius) had ever taken in education. In Slovakia the situation is different. The Slovaks under the Hungarian régime were kept in a backward state—they did not possess a single Slovak school—while still worse conditions prevailed in Russinia, some 75% of the population being unable to read or write. The Czechoslovak Government, between 1918 and 1921, set up some 2,000 additional elementary and some 40 higher schools in Slovakia and Russinia (including 80 new German schools), so that a vast improvement in the educational status of those countries is only a matter of time.

In the entire republic there are four universities, three Czech and Slovak—the Charles University of Prague, the Masaryk University of Brno and the Comenius University of Bratislava—and one German (at Prague). The Masaryk and Comenius Universities are new foundations since 1918. There are four polytechnics enjoying university rank at Prague and Brno, two of them being Czech and two German. At Příbram in Bohemia there is a high school of mines, while two other high schools have been founded at Brno, one for veterinary science and the other for agriculture.

A high standard of physical training is set by the popular gymnastic organizations, known as "Sokols." In addition to the original Sokol Society (founded in 1862) there are the special organizations of the Labour (Socialist) and the Catholic Gymnastic Unions (under Sokol influence). The great Sokol union has a membership of over 300,000 in all, and the programme includes not only physical but also moral and disciplinary training, aiming at the production of citizens of character and patriotism. The Sokol organization and the Sokol spirit were one of the mainsprings of the movement resulting, in the years 1914 to 1918, in the formation of the Czechoslovak legions on the various European battle-fronts. The "Scout" movement, too, both for boys and girls, has since 1918 developed with much success, especially in collaboration with the other original Czech gymnastic and sport corporations.

Religion.—The religious history of the lands which now compose the Czechoslovak Republic has a special interest for the English-speaking world owing to the fact that the work of John Hus, the

great Czech reformer (1369–1415) was largely a result of the influence of Wyclif. At the beginning of the 17th century some 90% of the Bohemians were Protestant, but the loss of independence and the effects of religious persecution (the Counter-Reformation) under the aegis of the Habsburg dynasty, caused the position to be reversed, and up to 1918 almost 90% of the Czechoslovak population was entered in the official statistics as belonging to the Roman Catholic Church. This adherence was, and still is, often only nominal, for the statistics take no note of the great mass of indifferentism and liberalism which prevails in the ranks of the Church. Two other tendencies were also manifest during the last few decades before the war: a movement among the intellectual classes, and to some extent among workers also, towards a non-ecclesiastical religious life; and an "Away from Rome" movement which in one aspect helped to recruit the ranks of Free Thought and on the other hand resulted in a growth of the Protestant churches. Between 1918 and 1921 about 1,000,000 persons left the Roman Church, the most conspicuous secession being that which resulted in the formation of a national "Czechoslovak Church." A considerable section of the priesthood demanded some dogmatical reforms, including the abolition of celibacy, the introduction of the vernacular into the Church services, and a more democratic administration of Church affairs. On the Holy See declining to meet these demands the "Czechoslovak Church" was founded in Jan. 1920. It has a membership of some 500,000, and possesses 120 churches. Further large secessions took place in favour of the Free Thought movement. The Protestants number about one million, the largest body being the Evangelical Church in Slovakia with a membership of over 400,000. In Bohemia the Evangelical Church of Czech Brethren represents a spiritual and historical continuity with the old Hussites. It was constituted in 1918 by the fusion of two existing Protestant bodies, the Reformed (Calvinist) Church and the Evangelical (Lutheran) Church. Other Protestant denominations (Presbyterian, Congregational, Baptist) are in smaller numbers. The Greek Church in Slovakia and Sub-Carpathian Russia has a membership of over 500,000, while the Jews number about 350,000.

Economics and Finance.—The economic and financial position of Czechoslovakia showed signs in 1921 of steady recovery from the chaos which succeeded the close of the war. Rich in natural resources and peopled by an intelligent, experienced and frugal population, the country had every reason to look forward to a prosperous industrial development in the future. Without Slovakia the republic would be mainly an industrial State: with it there is a slight preponderance in favour of agriculture, 41·5% of the entire population being occupied on or in connexion with the land and 38% in industry and commerce.

In special branches of industry Czechoslovakia is prominent among European countries, as for instance in the production of sugar and glass. In the manufacture of alcoholic liquors it occupies third place among European countries. It is less favourably placed in respect of the iron and textile industries, having to rely to a large extent upon the import of raw materials from abroad. The coal-mines of the country are capable of producing some 15 million tons of black coal and 24 millions of brown coal (lignite). The yield of iron ore is almost one million tons annually, while gold, silver, tin, graphite and salt are also mined. Iron and steel foundries exist at Kladno near Prague, as well as in Moravia and in Slovakia. Their blast furnaces produce 1,700,000 tons of pig-iron annually. The output of steel amounts to 298,000 tons, iron in bars 400,000 tons, iron girders 130,000 tons and sheet-iron 34,000 tons. Czechoslovakia manufactures and exports agricultural machinery, plant for sugar refineries and distilleries, locomotives, railway carriages and trucks and other rolling-stock, motor-cars, tractors. Aeroplanes are made at Prague and Plzeň (Pilsen). In its output of graphite Czechoslovakia takes second place among European countries, Great Britain being the first. Naphtha wells are working with favourable results at Gbely in Slovakia, and researches in progress at other points (Russinia) promise results that would make Czechoslovakia independent of foreign sources in respect of petroleum, even if no surplus were produced for export. Potters' clay, kaolin and felspar, which have largely facilitated the development of the flourishing porcelain industry, are found in various parts of the country, which is also fortunate in possessing sand suitable for use in the manufacture of the glass for which Bohemia has long been famous.

The economic importance of Czechoslovakia is strikingly shown by a comparison with the rest of the former Austro-Hungarian Monarchy. Previous to the war the present Czechoslovak territories were responsible for 92% of the sugar produced by Austria-Hungary, for 46% of the spirits, beer 57%, malt 87%, foodstuffs 50%, chemicals 75%, metals 60%, porcelain 100%, glass 90%, cotton goods 75%, woollen goods 80%, jute 90%, leather 70%, gloves 90%, boots 75%, paper 60%. The war, of course, cut off the supply of raw materials for the textile trade, which in 1921 was still suffering from shortage, particularly of raw cotton.

Czechoslovakia is the only European State which can export sugar: it is the second largest beet-sugar producer in the world, having some 500,000 ac. of beet under cultivation. In 1920–1 some 715,000 tons of sugar were produced, 189 factories and refineries being engaged in the industry, and 300,000 tons were available for export.

Of beer 13 million hectolitres are brewed annually, of which one million are exported. Exceptionally fine hops are grown in the Žatec (Saaz) district of Bohemia, and of these no less than 40% are exported. The republic has 676 breweries and 140 malt-houses.

With an area of over 10 million ac. of forest it is only natural that Czechoslovakia exports not merely large quantities of timber but also furniture, bent-wood furniture, toys, musical instruments, etc. Of the bent-wood furniture 90% is exported and finds a ready market in England and America. Paper is also produced to the extent of some 250,000 tons annually. Of porcelain 30,000 tons is produced annually in 68 factories, Karlovy Vary (Carlsbad) being the chief centre of the pottery industry.

Glass manufacture in Bohemia dates from the 15th century. Bohemian glass enjoys a world-wide reputation, which is well deserved: the crystal ware of Bor (Haida), the imitation jewelry and stones of Jablonec (Gablonz), the paste and semi-precious stones of Turnov, are exported to every part of the globe. Over 60,000 work-people are employed in the glass industry.

Leather is among the more important manufactures of Czechoslovakia. Boot factories employ 40,000 workmen, glove manufactories the same number. Some three-fourths of the entire output in both these wares are exported, largely to England and to Germany.

Czechoslovakia, as already indicated, is not only an industrial State: it possesses at the same time a highly developed agriculture in which over 40% of the entire population is engaged, that is to say, some 5,700,000 persons are workers in some way or other connected with the land. Climate and soil are favourable: beet-root is grown up to an altitude of 1,100 ft. and corn to 1,300 ft. above sea-level. Only 4% of all arable land in the country is unproductive (in Great Britain 15%). The chief agricultural products are potatoes and vegetables, beet-root and hops, wheat, rye, barley and oats. The agriculture of the republic supplies the material for several important industries, including the production of sugar, beer and spirits, starch (120 factories), syrup, glucose, chicory, coffee substitutes from rye and barley, jams. Alcohol and spirits are distilled in 1,100 distilleries employing 18,000 workmen and producing annually some 380,000 hectolitres (1919-20; 1,151,000 hectolitres before the war). Excellent wines are also made, those of Melnik in Bohemia and the Slovakian wines being the best known.

Agriculture is encouraged by a suitable system of education. Since it came into being the republic had by 1921 founded 13 new agricultural schools, and in all there were 180 agricultural and forestry schools (higher and elementary), including the so-called "winter schools," while more than 50 periodicals appeared regularly for the technical instruction of those engaged in agriculture. The agricultural interests were also represented directly in the Parliament by a strong Agrarian party.

The foreign trade of Czechoslovakia was in 1921 growing steadily in volume. Previous to the war the country's products were, of course, classed as Austrian goods: now the description of "Made in Czechoslovakia" was beginning to make its way in the markets of the world. In 1919 the republic exported merchandise to the extent of 566 million tons and imported 183 millions. In 1920 these figures rose to 690 and 200 million tons respectively. In 1919 Czechoslovak exports to Great Britain (exclusive of colonies) amounted to a value of 238 million crowns, imports to 328 millions. Sugar, malt, hops, beer, mineral waters, glass, porcelain, leather, gloves, furniture and toys are the principal articles of export to Great Britain.

While suffering from the symptoms affecting central Europe generally, the republic was distinctly better off as regards its financial situation than any of its neighbours. The budgets of 1919 and 1920 disclosed deficits of 5 billion and 3 billion kronen respectively, but in that for 1921 the revenue slightly exceeded the expenditure. Czechoslovakia was thus the only country in central Europe with a well-balanced budget. The national debt amounted to some 40 billion crowns, against which the state itself possessed assets in the shape of forests, coal mines, the former domains of the Habsburgs, mineral, naphtha, radium and other sources of natural wealth, besides the State-owned railways.

Communications.—As a wholly inland nation, Czechoslovakia has to rely in the matter of transport upon its railways and its waterways, notably the Elbe, which connects the republic with Hamburg and the North Sea, and the Danube, which unites it with the east of Europe and the Balkans. Under the peace treaties Czechoslovakia acquired her own docks and warehouses in the harbour of Hamburg. Before the war the Czechoslovak traffic on the Elbe totalled some 4 million tons annually. On the Danube the amount was 2 millions, but this total bids fair, under normal conditions, to be easily passed, inasmuch as the work of developing the port of Bratislava, the construction of docks, warehouses and shipbuilding yards, was already proceeding energetically. It was also proposed to link up the Elbe and the Danube by a canal which would enable direct transport to be effected from North and Baltic Seas to the Black Sea. A further scheme in contemplation was that of a Danube-Oder canal.

The total length of railway track in Czechoslovakia was in 1921 a little over 8,000 m., which represents 1 m. of railway for every 8½ sq. m. of area. In the course of a few years this mileage was to be

largely increased, Parliament having voted some 6,500 million crowns for further construction and improvements. Some 4,700 m. of track are State-owned; the rest are in the hands of private companies, but were gradually to be taken over by the State.

Czechoslovakia has 5,000 post-offices, some 10,000 m. of telegraphs, and close upon 8,000 m. of telephone communication. Aerial posts are established with Paris, Warsaw, Berlin, Vienna and Budapest, in addition to which there exist also cross-country services. The republic possesses seven radio-telegraph stations.

Literature, Art and Music.—The Czechs have possessed a notable literature from the 13th century onwards. It has shared the vicissitudes of the nation itself and like it been in danger of extermination at the hands of fanatic foes. The names of Hus, Chelčický and Comenius (Komenský) are connected with the pre-Renaissance religious periods. The revival of the Czechs after a hundred years of torpor, due to the loss of their independence in 1620 and subsequent oppression at the hands of the Habsburgs and the dominant Germans, gave birth, from 1780 onwards, to a literary activity which still continues to yield rich fruit. From the modest and simple art of the patriotic poets and novelists of the first half of the 19th century, whose work nevertheless was an influential factor in the awakening of a national sentiment among the common people, Czech literature, after a period characterized by the romanticism of Mácha and the critical realism of Havlíček, arrived at a school which, while it took its inspiration from the sources of the national spirit, did not shut itself out from foreign influences. Vrchlický, a master of verse and a perfect cosmopolitan, and Čech, who took the material for his epics from Czech history, are the outstanding names of this epoch. Among their contemporaries were Heyduk and Sládek, two poets both belonging in form and in matter to the national school. Sládek was, with his excellent translations, one of the first to make Czech readers acquainted with the riches of English literatnre (especially Shakespeare). Eminent among the novelists of this generation were Němcová, a good observer of social conditions who reproduced in her works the charm of Bohemian peasant life; her kinswoman Světlá, Arbes and Zeyer. Neruda, a poet of bitter irony but of profound faith in and affection towards his nation, was also the author of novels, notable for their original realism, and numerous belletristic works of a high order. He marks the period of transition to the younger generation of writers, in the forefront of whom stands the poet and novelist Hachar, who revolutionized the conception of Czech patriotism and is famous for his historical glosses. Jirásek, the author of a vast series of novels and short stories, drawing their material from Bohemian history, unites the past with the present generation. By the healthy spirit of patriotism breathed in all his works Jirásek contributed not a little to maintaining among the masses of the people a national consciousness and faith in a better national future. The youngest literary generation in Czechoslovakia was represented in 1921 in particular by three leading poets: Sova, a writer of delicate lyrics; Bezruč, who sings of social and national oppression, and Březina, a profound visionary and pantheistic mystic. Among prose writers the leading contemporary names are Svobodová, Čapek, a robust realist, and Šrámek, who has also met with success as a dramatist. In Slovakia the foremost name is that of the poet Hviezdoslav.

The Czechs were famous as musicians as far back as the 15th century. The history of modern Czech music commences with the creator of Czech opera, Frederick Smetana. The compositions of Dvořák have become classics. Among contemporary composers in 1921 the foremost were Foerster, Novák, Ostrčil, and Suk; and as executants Ševčík, Kubelík and Ondříček.

Eloquent testimony is given by the beautiful churches and palaces of Prague—largely Gothic and baroque in style—to the architectural genius of the nation. The graceful cathedral of St. Vitus, rising above the castle (*Hrad*) on the heights of the Hradčany (Prague), is a magnificent specimen of Gothic. The beautiful church of St. Barbara at Kutná Hora, the royal castle of Karlův Týn, the Powder Tower, the church of St. Nicholas, the King Charles bridge at Prague, are among the many objects of universal admiration which are to be found in Bohemia.

Of modern sculptors the works of Myslbek and Sucharda are prominent in the public monuments at Prague. The latter, as well as others of the younger school of Czech sculptors, such as Bílek, Kafka and Mařatka, studied under Rodin at Paris.

Modern painting among the Czechs begins with Josef Mánes (1826–71) and Czermak (1831–78), and Aleš. Brožík is known for his historical canvases, among them "John Hus before the Council of Constance," while others worth mention are the marine painter Knuepfer, the landscape painters Slavíček and Hudeček, and Preisler and Švabinský as painters of portraits and allegorical subjects. Mucha has won a name abroad for decorative work and historical canvases. In Slovakia, Joža Úprka and his school have devoted themselves to interpreting peasant life.

Science and Philosophy.—In the course of the new intellectual life, by which after three hundred years of subjection the Czech nation again entered the ranks of the living peoples of Europe, scientific effort early resumed its due place.

At the very threshold of the Czech renaissance men of science were among the first pioneers of national thought, as for example Dobrovský the philologist, and in the ensuing generation Purkyně (Purkinje) the physiologist, and Palacký the greatest of Czech historians. Scientific effort received an impetus from the establishment of an independent Czech university at Prague in 1881, and from that time there is hardly a branch of science in which workers of profound and creative talent did not arise (in physics Zenger, in biology Vejdovský), while a whole series of eminent names as well in the technical and mathematical as in the historical and philological (*e.g.* Zubatý) sciences might be mentioned.

Philosophy was early cultivated in Bohemia. At first the influence of German thought, German enlightenment and idealism was apparent, particularly in Kollár (a Slovak); the influence of Kant was seen in Palacký, that of Hegel and post-Kantian speculation in Aug. Smetana, while the philosophy of Herbart had a deep influence on educationists like Lindner, Durdík and Hostinský. To the more recent tendencies of contemporary philosophical thought the way was opened up by Thomas G. Masaryk, who, as a counterpoise to German speculation and the intellectualism of Herbart, emphasized the critical study of English philosophy, notably Hume, Spencer and Mill, and the French Comte; at the same time he fully appreciated the value of Kant in epistemology. Masaryk's work, *Spirit of Russia*, is a close analysis of the Russian philosophy of history, and of the Russian religious, moral and political thought. Enriched by new ethical and religious elements, Czech philosophy manifests itself in Masaryk's works as a new realism or humanism. A whole series of philosophic thinkers—Drtina, Foustka, Rádl and Beneš—followed in Masaryk's footsteps.

CZERNIN, OTTOKAR, COUNT (1872–), Austro-Hungarian statesman, a scion of an old Bohemian noble family, was born on Sept. 27 1872. He adopted a diplomatic career, was attached in 1891 to the Paris embassy, promoted to the rank of unpaid attaché of embassy, and then, after a lengthy period of leave, sent to The Hague in 1902. In that year, however, he retired and devoted himself to the management of his estates. In 1903 he was elected to the Bohemian Diet as a representative of the landed aristocracy. Here he attached himself to the German party, but demanded that every inhabitant of Bohemia should regard himself as an Austrian first, and only second as a German or a Czech. Connected by his wife, *née* Kinsky, with the Czech nobility, he tried to pave the way for a working alliance of the great landowners supporting the existing Constitution with the Conservative group in the Bohemian Diet, and in 1905 published a brochure with this object. In 1911 he published a signed essay on the measures to be taken to preserve the union of the empire (*Zur Erhaltung der Reichseinheit*), which represented the views of the heir to the throne, the Archduke Francis Ferdinand, with whom he had become intimate. In Feb. 1912 he became a member of the Austrian Upper House, attaching himself to the Constitutional party. His speeches, in which he advocated a vigorous internal and external policy, made a great sensation. Czernin at that time was regarded as Francis Ferdinand's candidate for the office of Foreign Minister. In Oct. he went as Austro-Hungarian minister to Bucharest. His dispatches published in the "Red Book" show that even at that time he was of opinion that the secret treaty signed by King Charles with the Triple Alliance was nothing but a "scrap of paper," and that in an international war Rumania would only be induced to take part on the side of the Central Powers by far-reaching concessions at the expense of the Habsburg Monarchy. He watched with regret the growth

of anti-Austrian sentiment in Rumania, whose attitude after the outbreak of the World War proved the correctness of his judgment. He now sought even at a cost to win over Rumania to fight on the side of the Central Powers. But his efforts proved fruitless, because the leading Hungarian statesmen would not agree to Rumanian demands involving the cession of Hungarian territory. For a long time Czernin succeeded in persuading Rumania to remain neutral. When, at the end of 1916, she finally passed over into the Entente camp Czernin returned to Vienna. The foresight which he had shown as minister at Bucharest, the skill and zeal displayed in his intercourse with the Rumanian court and Government, and his good personal relations with influential circles at Bucharest, decided the Emperor Charles to entrust him with the direction of Austro-Hungarian foreign policy in succession to Count Burian.

Czernin was, and remained, a decided advocate of the view that the Central Powers could not obtain so crushing a victory over the enemy in the field as to be able to dictate the conditions of peace. Therefore, from the day of his taking office down to his resignation he consistently maintained that, even at some sacrifice, they ought to seek the conclusion of a peace which should preserve to them their position as great Powers. Czernin did not indeed contemplate the conclusion of a separate peace with the enemy, but as against German statesmen he insisted that Germany also, especially in the questions of Belgium and Alsace-Lorraine, would have to reconcile herself to concessions. By gloomily painted pictures of the military, political and economic situation of Austria-Hungary he sought to influence the German Emperor and the German higher command, and succeeded in awakening sympathy with his peace ideas among the members of the German Reichstag. Czernin was not only cognizant of the peace negotiations which the Emperor Charles opened with England and France through his brother-in-law, Prince Sixtus of Parma, but he approved of them. He knew nothing, however, of the contents of the letter of March 24 1917, in which the Emperor Charles spoke of his willingness to support the "just demand" of France for the return of Alsace-Lorraine by any means and by the use of his whole personal influence with his ally. But he himself was simultaneously engaged in trying to influence German statesmen in the same sense, promising in the event of their making sacrifices in the west to compensate them in the east, chiefly by the acquisition of Polish territory. But his efforts, then and later, broke down on the determination of the German army leaders to obtain a military decision. These men saw in Czernin a danger to the political and military interests of the Alliance, and attacked him violently. During the negotiations at Brest-Litovsk from Dec. 1917 to March 1918, the opposition between the views of the Austro-Hungarian delegation led by Czernin and the German delegation became strikingly manifest. In the negotiations leading up to the convention between Russia and the Quadruple Alliance, signed on March 4 1918, Czernin took a conspicuous part. A few weeks earlier peace had been concluded at Brest-Litovsk with the newly founded republic of the Ukraine. The fact that Czernin, in order to secure this "bread peace," had ceded to Ukraine the district of Chelm, to which the Poles laid claim, aroused the most violent resentment among the Poles, and led to unsparing attacks upon him by the Austrian Poles. In the beginning of April 1918 his position was no longer tenable. The immediate cause of his resignation on April 14 1918 was the conflict between him and the Emperor Charles over the "Sixtus letter." Czernin was one of the few active statesmen among the Austrian nobility who sought to continue their political activity under the Austrian Republic. At the end of 1920 he became the representative of the Liberal bourgeois party of central Vienna in the National Parliament.

For Czernin's activity in Bucharest and in the World War see his *Im Weltkriege* (1919). His despatches from Bucharest are printed in the Austro-Hungarian Red Book, *Diplomatische Aktenstucke betreffend die Beziehungen Oesterreich-Ungarns zu Rumanien, 22 Juli 1914 bis 27 August 1916*. A favourable view of Czernin's attitude in the "Sixtus Affair" is taken by Count August Demblin in *Czernin und die Sixtusaffaire* (1920); the standpoint of Prince Sixtus is represented in *Prince Sixt de Bourbon. L'offre de la paix séparée de l'Autriche* (1921). (A. F. PR.)

D'ABERNON, EDGAR VINCENT, 1ST BARON (1857 –), English politician, was born at Slinfold, Sussex, Aug. 19 1857, the youngest son of Sir Frederick Vincent, 11th Bart., of Stoke d'Abernon, Surrey. He was educated at Eton, and was intended for the diplomatic service, being in 1877 head of the examination list for the appointment of student dragoman at Constantinople. The same year, however, he entered the army, but in 1880 was appointed private secretary to Lord Edmond Fitzmaurice, at that time commissioner for Eastern Rumelia. The following year he became a member of the commission for the evacuation of territory ceded to Greece by Turkey, and in 1882 was sent to Constantinople as the representative of Great Britain, Holland and Belgium on the council of the Ottoman public debt, of which in 1883 he became president. In 1883 he was sent to Cairo as financial adviser to the Egyptian Government, remaining there until 1889, when he returned to Constantinople as governor of the Imperial Ottoman Bank, a post which he resigned in 1897. In 1887 he received the K.C.M.G. Sir Edgar Vincent entered Parliament in 1899 as Conservative member for Exeter, but lost this seat in 1906. He unsuccessfully contested Colchester in 1910. In 1914 he was raised to the peerage as Baron D'Abernon, and became very prominent during the World War as chairman of the Central Liquor Control Board. In 1920 he was appointed ambassador to Germany. Lord D'Abernon published in 1881 a *Grammar of Modern Greek*, which was adopted for use by the university of Athens. He married in 1890 Lady Helen Venetia Duncombe, daughter of the 1st Earl of Feversham.

DAHN, JULIUS SOPHUS FELIX (1834–1912), German historian, jurist and poet (*see* 7.734), published his complete works of fiction, both in prose and verse, in 1903. The final volume of *Die Könige der Germanen* appeared in 1911. He died at Breslau Jan. 3 1912.

DAHOMEY (*see* 7.734).—An estimate made in 1918 put the population at slightly over 900,000, of whom 65% lived in the coast and adjacent regions. Upper Dahomey, two-thirds in area of the whole colony, has no more than 12 inhabitants per sq. m., compared with 50 per sq. m. in Lower Dahomey. Porto Novo (seat of Government and chief business centre) had about 25,000 inhabitants, including some 400 Europeans. Whydah and Abomey each had a population of 12,000 odd. In all there were over 700 Europeans in Dahomey. There are large numbers of mulattoes in the coast towns, chiefly employed as clerks.

Trade and Communications.—The French devoted much attention to the development of the natural resources of the country and in opening communications. The metre gauge railway from Kotonu (the ocean port of Porto Novo) which runs parallel to the Nigerian frontier reached Savé, 162 m. inland, in 1912. Thence a metalled road (nearly 300 m. long), with substantial bridges was built to the Niger at Madekali, just W. of the British (Nigerian) frontier. Along this *Route de l'Est* a motor wagon service for passengers, mails and goods was opened in 1912. From Pahu, 16 m. from Kotonu, a branch line (20 m. long) runs W. to Whydah and Segboroué. The line from Porto Novo to Sakete, near the Nigerian border, was in 1914 extended to Pobé (total length 47 m.). On the Togoland side there is a good metalled road connecting with the middle Niger regions. In the coast region a mail steamer service was opened in 1912 along the lagoons between Porto Novo and Lagos.

Cocoa plantations were largely developed from 1912, and the coconut palm—for the copra trade—introduced in the lagoon districts, while in central Dahomey cotton plantations met with success. Maize is largely grown for export, and there are considerable herds of cattle in the north. But palm oil remains the chief source of wealth of the country; oil palms cover about 600,000 ac. The volume of trade increased during 1905-12 from £1,075,000 to £2,530,000. The trade for 1916 was valued at £1,446,000; in 1918 at £2,332,000 (evenly distributed between imports and exports). The increase in 1918 was largely due to higher prices. Palm kernels and palm oil are the chief exports; maize, cotton, dried fish, copra, shea nuts and shea butter rank next in value. Cotton goods, gin and trade spirits are the chief imports.

Before the war Hamburg took nearly all the palm kernels; during and since the war the kernels have gone mainly to Liverpool. In 1913 Germany had 49·28% of the total trade, France 26·47, the United Kingdom 23·74; the elimination of Germany told mostly in favour of the United Kingdom. The colony is self-supporting; in 1919 the budget balanced at £237,000. Nearly half the revenue is derived from a poll tax on the natives.

History.—In 1911 the French deposed the chief, a member of the old royal family, whom they had installed at Abomey. He had been intriguing against French rule. His territory was divided among a number of petty chiefs placed under the direct control of the resident at Abomey, and the whole country became the colony of Dahomey and its dependencies. From that time little trouble was experienced in the native administration. In Sept. 1912 a Franco-German convention approved the delimitation of the Dahomey-Togoland frontier which had been made by boundary commissions. Less than two years later, on the outbreak of the World War (Aug. 1914), small columns of French troops entered Togoland and coöperated with the British in its conquest. The energetic action of M. C. Noufflard (the Lt.-Gov.) and of Commandant Mariox (senior military officer) and Capt. Costaing helped to bring the conflict to a speedy close and to keep Dahomey itself peaceful. The natives of Dahomey furnished contingents for the Cameroon campaign and for Europe.

See *Dahomey* (1920), a useful handbook issued by the British Foreign Office; A. Le Hérissé, *L'Ancien royaume du Dahomey* (1911); P. Sprigade, "Die französische Kolonie Dahome" in *Mitt. deutschen Schutzgebieten* (1918); *L'Afrique Française* (Paris, monthly). (F. R. C.)

DAIL EIREANN: *see* IRELAND, section *Political History.*

DAMROSCH, WALTER JOHANNES (1862–), American musician and conductor, was born at Breslau, Germany, Jan. 30 1862. He came to America in 1871 and ten years later began his career as conductor in Newark, N.J. In 1894 he founded the Damrosch Opera Co. for producing Wagner. In 1896 he produced, as director of the Oratorio Symphony Societies, Wagner's *Parsifal* in concert form for the first time in the United States. Since 1903 he has been director of the New York Symphony Orchestra. He is the composer of *The Scarlet Letter* (1894); *Cyrano* (1913); and music for Euripides's *Medea*, *Iphigenia in Tauris* (Berkeley, 1915) and Sophocles's *Electra* (New York, 1917). At the request of Gen. Pershing he reorganized the bands of the A.E.F. in 1918.

His brother, FRANK HEINO DAMROSCH, was born at Breslau June 22 1859. He was conductor in Denver, Newark, Bridgeport, and New York (the Oratorio Society 1898–1912). From 1905 he was director of the Institute of Musical Art.

DANCING (*see* 7.794).—The years 1910–20 saw a remarkable revival of the love of all kinds of dancing in England and America. On the one hand the organization popularly known as the Russian Ballet has put new life into stage dancing, while on the other the Americans are responsible for a reawakening of the love of dancing in the ballroom. At the end of the 19th century the ballet in England had become a spectacular show of very little artistic significance; the standard of dancing technique was of the lowest and, except in the case of one or two dancers such as Adeline Genée, it is doubtful whether stage dancing could be called an art at all. In the ballroom, dancing had become a rather perfunctory social function, practised without any particular skill or regard for steps.

Classical Dancing.—The revolution in stage dancing was started in England by Serge Diaghilieff's company of Russian dancers, but no account of modern stage dancing would be complete without some reference to the so-called "Classical Dancing" which came into vogue at the beginning of the 20th century and had such an influence on all the stage dancing of a later date. Classical dancing was a revolt against the form and style of the stage ballet as it then existed. It was an attempt to rescue the art from the artificiality of the older ballet, and bring beauty of line and movement into prominence, instead of the technical skill of the steps alone. In addition to this, classical

dancers laid stress upon the musical side; they sought to interpret the great composers in dancing; valses of Chopin, Mendelssohn's "Spring Song," some of the smaller works of Schubert—all these were "interpreted" in different ways. The dancers sought to catch the mood of each piece of music by an appropriate series of poses and movements, which were intended to be not only expressive of the music but beautiful in themselves. The costume worn was a simple dress in the Greek style, with the feet bare; the strangeness of this costume at the time and the similarity of many of the poses to Greek paintings and friezes led to the use of the word "classical" for this dancing.

The first and greatest exponent of this particular school was Isadora Duncan. Her own point of view with regard to stage dancing is worthy of mention:—

"In my art I have by no means copied, as has been supposed, the figures of Greek vases, friezes, and paintings. From them I have learned to regard nature, and when certain of my movements recall gestures that are seen in works of art it is only because, like them, they are drawn from the grand natural source."

This description epitomizes the whole of the theory of classical dancing, and Isadora Duncan's numerous successors improved very little either on her own theory or practice. Her technique was of her own invention and, although the result looked simple and easy enough, the training to which she subjected herself was severe. Perfect balance, perfect transition from one pose to another however slowly, perfect control of breathing and movement, all these, she found, required as much practice and study as the older style of ballet dancing. There was nothing impromptu, nothing amateurish in her work. The result was entirely novel and at first was received with ridicule both in Europe and America; it was only much later that she achieved the success and received the praise which were her due. She danced on the stage by herself without scenery and with only a simple background of curtains which showed off the movements to their best advantage and kept the concentration of the audience on the dancer only.

It was left to one of Isadora Duncan's successors, Maud Allan (b. 1879), to popularize classical dancing in England. Her strongest quality was the very interesting way in which she interpreted musical phrases and moods. The early musical training she had in Berlin accounted no doubt for this fascinating quality.

The influence of classical dancing on the stage dancing of a later date is very considerable. The ballet which was designed by Nijinsky to the music of "L'Après-midi d'un Faune" of Debussy, and which was danced by him with picked members of Diaghilieff's *corps de ballet*, would never have been possible without Isadora Duncan, and her dancing undoubtedly had a great influence in bringing stage dancing back into relation with real life and away from the absurd artificiality of the 19th century stage ballet.

The "Russian Ballet."—England hardly had time to recover from the revolutionary methods of Isadora Duncan and Maud Allan when there appeared a new organization which was acclaimed with rapturous applause and enthusiasm, first of all by the artistic world of London and very shortly afterwards, at their bidding, by the general public. Serge Diaghilieff was responsible for the introduction of this company and was the moving spirit in collecting together the various people who contributed to this highly artistic and successful enterprise. He it was who enlisted the services of Léon Bakst and Alexandre Benois, the designers of the scenery and costumes; Michel Fokine, the producer and arranger of the dances; Nicholas Tcherepnin, the musical director; and the leading dancers, Karsavina, Anna Pavlova, Lydia Lopokowa, Vaslav Nijinsky, Adolph Bolm, Léon Massine and Enrico Cecchetti.

The success of this company not only in London but all over the world—they visited all the principal towns of Europe and America—was all the more unexpected because very few people in England were aware that anything so perfect could come out of Russia. The existence of the Imperial Court ballet at St. Petersburg was dimly known, and it was thought at first, quite wrongly, that Diaghilieff's company had some connexion with it. So far from this being the case it can truthfully be said that the connoisseurs of dancing in St. Petersburg had no great opinion of Diaghilieff's productions and achievements. The Imperial Russian Ballet was instituted in 1735 and continued up to the revolution and the Tsar's deposition in 1917. The high standard of technique of the Imperial Ballet was very largely due to Didelot, a ballet master of the early 19th century at St. Petersburg, but Diaghilieff's troupe was a very revolutionary body, and had very little in common in idea with the Imperial Ballet. True, the *corps de ballet* and dancers of the "Russian Ballet" were trained in the Imperial schools, and Fokine was the assistant ballet master at the St. Petersburg opera, but Bakst and Tcherepnin had no connexion whatever with the Imperial Ballet. The classical ballets performed by the Imperial Ballet at St. Petersburg year after year did not as a rule form part of Diaghilieff's repertoire. His outlook on stage dancing differed as much from the official ideas in Russia as those of Isadora Duncan from John Tiller. His aim, like Miss Duncan's, was to bring the ballet into relation with real life and the contemporary arts which go to make up the "production."

The ballets themselves can be divided broadly into two classes: those which are the lineal descendants of earlier ballets, and those which are essentially experiments in new directions. Into the first category fall such ballets as "Lac des Cygnes," "Pavillon d'Armide," "Cléopatre," "Thamar," "Oiseau de Feu," "Petrouchka," the dances from "Prince Igor" and "Sylphides." With regard to the last-named an interesting point was the the use of Chopin's music, orchestrated by well-known Russian composers. This orchestration of what was hitherto considered as essentially piano-music created quite a sensation, and was one of the most successful efforts of the Diaghilieff company. The vivid colour schemes of the scenery and dresses, and the modernity of some of the music (as in "Petrouchka"), were as much responsible for the effect of vitality and realness as the standard of the choreography and dancing, which were in themselves higher than any hitherto seen in England. Apart from the setting however, the characterization of the various personages in these ballets was presented in such a way as to make the stage people seem alive and convincing to the audience, every device of stage-craft and orchestration being used to this end.

With regard to the second category of ballets, "L'Après-midi d'un Faune" was an attempt that was only partially successful to bring the plastic arts of Greece on to the stage. "Le Sacre du Printemps" was a return to the "primitive," in the artistic sense. For both these, Nijinsky was mainly responsible as producer, and Stravinsky's music to the latter ballet was furiously "modern" into the bargain. It is doubtful whether these last-mentioned productions or any of the still later ballets, however interesting as experiments, were as satisfying artistically or theatrically perfect as the early ones of Fokine and Bakst. "The Good-Humoured Ladies" and other clever little scenes, charming in themselves, have not gone much further aesthetically, and in 1920 the standard of the dancing and the performance of the music were not on quite so high a level as in the first years of production.

Ballroom Dancing.—In the ballroom a different kind of revolution has been effected by the introduction of new dances and music from America. The only dance that has survived this invasion is the valse, but even this dance has altered so much in style that it now bears very little resemblance to the dance immortalized by Edward and Johann Strauss. The dances in common use (1921) are the fox-trot, one-step and the valse; the one-step is the most energetic of all the modern dances, owing to the clearly defined beats of the music, which is in quick march-time; the fox-trot is the lineal descendant of the polka, although the steps are not the same, and it is danced more smoothly, without the jerkiness of its ancestor. The steps are legion and ever changing with the style of the dancers. There are only three or four steps which are used by all couples and consequently make it possible for a man to dance with a new partner

for the first time. The woman's part in these dances is absolute passivity; she has to follow the man's lead and be responsive to his lightest touch. Every good dancer is now an adept at this, and the variety of steps in common use is surprising.

The evolution of the valse from mid-Victorian days is worthy of note. At the beginning of the 20th century, for some reason which is quite obscure, the tendency of dance bands was to play the valse faster every year than the last. The result of this was that the valse, which was then by far the most popular dance, instead of being slow in time, became a series of fast revolutions. Dancers refused, in consequence, to continue to perform what one may call the one-two-three circular rhythm of the valse at the accelerated pace; they found the solution of the problem was to dance the same steps at a slower rate in cross rhythm against the music. Various other steps were added to enable these couples to manoeuvre successfully among the old-fashioned dancers. These new steps became crystallized, others were added, and the result was finally taught as the "Boston."

The popularity of the "Boston" was short-lived owing to the difficulty of the performance in cross rhythm, and the congestion of traffic in the ballroom on account of the different speeds of the revolving couples. As soon as the new American dances obtained a hold in England the latitude in steps so essential to the new dances was extended to the old valse. The *tempo* of the music slowed down to its original speed and the "Boston" disappeared. Valses were played more slowly and the latitude of steps was the same as in the other dances. The old one-two-three step has very largely gone, and the difference between a valse and a fox-trot is mostly one of rhythm. The modern valse was called the "Hesitation" as opposed to the earlier "Boston."

The "Tango" was the result of an attempt on the part of dancing teachers to introduce a new dance into the ballroom about the year 1913. It came originally from America and is said to be founded on a dance used in the cafés of South America, which would account for its somewhat "Spanish" style; the rhythm of the music is akin to that of the "Habañera." The most remarkable feature of all the dances described above as opposed to the dances of earlier generations is that the personality of the dancers is clearly reflected by the steps they use.

The music of the modern ballroom is almost entirely supplied by the United States. The music used in the American dances is no longer a string band and piano, but consists of various combinations, the most common of which perhaps is:—piano, violin, alto or tenor saxophone, banjo and jazz-drum. This last-named needs some explanation. The word "jazz" signifies noise in America and is in no way a dance. The drummer uses a side drum, a big drum and cymbals played with the feet, and various other instruments on which he beats a tattoo with his drum-sticks in alternation with the side drum. He is in fact a sort of one-man band in himself and adds considerably to the rhythm of the ensemble. There is as much variety in the method of playing dance music to-day as in the dances themselves. Dance bands therefore vary considerably in skill, as might be expected, and the best known command very high salaries. The skill of a modern dance band lies in two essentials: first, good rhythm; and secondly, cleverness in extemporising variations on the tune by the different executors.

The effect of the American dances has not yet permeated the social scale, and the masses among whom dancing has always been a popular pastime, and they continue to prefer the dances of the 19th century. (G. T.*)

DANIELS, JOSEPHUS (1862–), U.S. politician, was born at Washington, N.C., May 18 1862. He studied at the Wilson (N.C.) Institute and at the age of 18 became editor of the *Wilson Advance*. He was admitted to the bar in 1885, but preferred newspaper work, becoming editor of the *Raleigh State Chronicle*. He was printer for the state of North Carolina from 1887 to 1893, and then for two years, under President Cleveland's administration, was chief clerk of the Department of the Interior. From 1904 he was editor of the *Raleigh News and Observer*, with which his former paper was consolidated. He was twice a delegate to the National Democratic Convention, and from 1896 to 1916 was a member of the Democratic National Executive Committee. He early became a supporter of Woodrow Wilson for the presidency and was publicity manager for his campaign in 1912. In 1913 he was appointed Secretary of the Navy by President Wilson. In 1914 he issued an order prohibiting the use of intoxicants on ship-board and within the limits of navy yards and stations. His personal interest in the enlisted men was shown by his provision of opportunities for training in various trades. From the first he advocated increase of the navy. During his first years as Secretary of the Navy he was much criticized, but after America's entrance into the World War the criticism died down. He favoured Government ownership of armour plate plants as well as of telephones and telegraphs. On retiring from the secretaryship of the Navy in 1921 he resumed his duties as editor of his newspaper. He was the author of *The Navy and the Nation* (1919).

DANKL, VIKTOR, FREIHERR VON (1854–), Austro-Hungarian general, was born in Udine. After service in the cavalry he was employed in important staff positions. In the World War he commanded at the outset the I. Army and defeated the Russians in the battle of Krasnik (Aug. 23–5 1914). After the Italian declaration of war he became in May 1915 commander of the defence forces in Tirol. As an army commander in the following years he took a successful part in the offensive against Asiago-Asiero, but shortly afterwards retired from his post on account of ill-health.

D'ANNUNZIO, GABRIELE (1863–), Italian poet, man of letters and soldier (*see* 2.78). Later years, from 1908 to 1921, were the most active in D'Annunzio's career, not only in the literary field but also in those of war and politics. In 1908 he produced *La nave*, a vivid presentation of the early history of Venice, in which he sets forth his aspirations for Italy's mission as a great sea power, mistress of the Adriatic—a curious forecast of his future political action. The following year *Fedra* appeared, a classical drama, and in 1911 *Le martyre de St. Sébastien*, a dramatic mystery play written by D'Annunzio in French verse and first performed in Paris, with musical interludes by Debussy; it was a remarkable *tour de force* and appreciated as such by French critics, but is hardly one of his greatest achievements. *La Pisanella, ou la mort parfumée* (1913), also written in French and first produced in Paris, is a picturesque reconstruction of the mediaeval Levant set forth in the author's gorgeous colouring. The same year he brought out in Paris *Chèvre-feuille*, a drama of modern life, with a plot adapted from Hamlet and containing some powerful scenes, and in 1914 he produced a slightly different Italian version of it entitled *Il ferro*. *Parisina*, a lyric tragedy in a Renaissance setting with music by Mascagni, was first performed at Milan, also in 1914. His attraction towards the stage did not wholly suspend his output in the field of fiction, and in 1911 he published *Forse che si, forse che no*, a powerful but somewhat long-winded novel in which aviation plays a considerable part, and in 1913 *La Leda senza cigno*, a collection of pieces, half essays and half fiction, which originally appeared in the *Corriere della Sera* and were afterwards issued in three volumes with a *licenza* in 1917. His purely poetic output was limited to the *Canzoni della gesta d'Oltremare* (1911), dealing with the Libyan war and containing some admirable verse, and also some violent invectives against the Powers which were hampering Italy in her Mediterranean policy.

The outbreak of the World War did not put an end to D'Annunzio's literary activity. For some years he had been living in France, having had to leave Italy on account of financial difficulties, but the moment the conflict began he became deeply impressed with the vital necessity for Italy to participate in it so as to realize her aspirations towards complete unity and affirm her sovereignty in the Adriatic. His addresses to the Italian people, full of eloquent and inspiring patriotism, were afterwards published in a volume *Per la piu' grande Italia*. In the spring of 1915 he returned to Italy; his speeches at Quarto for the celebration of Garibaldi's Sicilian expedition and in Rome aroused wide-spread enthusiasm, and undoubtedly contributed very largely to Italy's intervention. From the moment Italy declared

dancers laid stress upon the musical side; they sought to interpret the great composers in dancing; valses of Chopin, Mendelssohn's "Spring Song," some of the smaller works of Schubert—all these were "interpreted" in different ways. The dancers sought to catch the mood of each piece of music by an appropriate series of poses and movements, which were intended to be not only expressive of the music but beautiful in themselves. The costume worn was a simple dress in the Greek style, with the feet bare; the strangeness of this costume at the time and the similarity of many of the poses to Greek paintings and friezes led to the use of the word "classical" for this dancing.

The first and greatest exponent of this particular school was Isadora Duncan. Her own point of view with regard to stage dancing is worthy of mention:—

> "In my art I have by no means copied, as has been supposed, the figures of Greek vases, friezes, and paintings. From them I have learned to regard nature, and when certain of my movements recall gestures that are seen in works of art it is only because, like them, they are drawn from the grand natural source."

This description epitomizes the whole of the theory of classical dancing, and Isadora Duncan's numerous successors improved very little either on her own theory or practice. Her technique was of her own invention and, although the result looked simple and easy enough, the training to which she subjected herself was severe. Perfect balance, perfect transition from one pose to another however slowly, perfect control of breathing and movement, all these, she found, required as much practice and study as the older style of ballet dancing. There was nothing impromptu, nothing amateurish in her work. The result was entirely novel and at first was received with ridicule both in Europe and America; it was only much later that she achieved the success and received the praise which were her due. She danced on the stage by herself without scenery and with only a simple background of curtains which showed off the movements to their best advantage and kept the concentration of the audience on the dancer only.

It was left to one of Isadora Duncan's successors, Maud Allan (b. 1879), to popularize classical dancing in England. Her strongest quality was the very interesting way in which she interpreted musical phrases and moods. The early musical training she had in Berlin accounted no doubt for this fascinating quality.

The influence of classical dancing on the stage dancing of a later date is very considerable. The ballet which was designed by Nijinsky to the music of "L'Après-midi d'un Faune" of Debussy, and which was danced by him with picked members of Diaghilieff's *corps de ballet*, would never have been possible without Isadora Duncan, and her dancing undoubtedly had a great influence in bringing stage dancing back into relation with real life and away from the absurd artificiality of the 19th century stage ballet.

The "Russian Ballet."—England hardly had time to recover from the revolutionary methods of Isadora Duncan and Maud Allan when there appeared a new organization which was acclaimed with rapturous applause and enthusiasm, first of all by the artistic world of London and very shortly afterwards, at their bidding, by the general public. Serge Diaghilieff was responsible for the introduction of this company and was the moving spirit in collecting together the various people who contributed to this highly artistic and successful enterprise. He it was who enlisted the services of Léon Bakst and Alexandre Benois, the designers of the scenery and costumes; Michel Fokine, the producer and arranger of the dances; Nicholas Tcherepnin, the musical director; and the leading dancers, Karsavina, Anna Pavlova, Lydia Lopokowa, Vaslav Nijinsky, Adolph Bolm, Léon Massine and Enrico Cecchetti.

The success of this company not only in London but all over the world—they visited all the principal towns of Europe and America—was all the more unexpected because very few people in England were aware that anything so perfect could come out of Russia. The existence of the Imperial Court ballet at St. Petersburg was dimly known, and it was thought at first, quite wrongly, that Diaghilieff's company had some connexion with it. So far from this being the case it can truthfully be said that the connoisseurs of dancing in St. Petersburg had no great opinion of Diaghilieff's productions and achievements. The Imperial Russian Ballet was instituted in 1735 and continued up to the revolution and the Tsar's deposition in 1917. The high standard of technique of the Imperial Ballet was very largely due to Didelot, a ballet master of the early 19th century at St. Petersburg, but Diaghilieff's troupe was a very revolutionary body, and had very little in common in idea with the Imperial Ballet. True, the *corps de ballet* and dancers of the "Russian Ballet" were trained in the Imperial schools, and Fokine was the assistant ballet master at the St. Petersburg opera, but Bakst and Tcherepnin had no connexion whatever with the Imperial Ballet. The classical ballets performed by the Imperial Ballet at St. Petersburg year after year did not as a rule form part of Diaghilieff's repertoire. His outlook on stage dancing differed as much from the official ideas in Russia as those of Isadora Duncan from John Tiller. His aim, like Miss Duncan's, was to bring the ballet into relation with real life and the contemporary arts which go to make up the "production."

The ballets themselves can be divided broadly into two classes: those which are the lineal descendants of earlier ballets, and those which are essentially experiments in new directions. Into the first category fall such ballets as "Lac des Cygnes," "Pavillon d'Armide," "Cléopatre," "Thamar," "Oiseau de Feu," "Petrouchka," the dances from "Prince Igor" and "Sylphides." With regard to the last-named an interesting point was the the use of Chopin's music, orchestrated by well-known Russian composers. This orchestration of what was hitherto considered as essentially piano-music created quite a sensation, and was one of the most successful efforts of the Diaghilieff company. The vivid colour schemes of the scenery and dresses, and the modernity of some of the music (as in "Petrouchka"), were as much responsible for the effect of vitality and realness as the standard of the choreography and dancing, which were in themselves higher than any hitherto seen in England. Apart from the setting however, the characterization of the various personages in these ballets was presented in such a way as to make the stage people seem alive and convincing to the audience, every device of stage-craft and orchestration being used to this end.

With regard to the second category of ballets, "L'Après-midi d'un Faune" was an attempt that was only partially successful to bring the plastic arts of Greece on to the stage. "Le Sacre du Printemps" was a return to the "primitive," in the artistic sense. For both these, Nijinsky was mainly responsible as producer, and Stravinsky's music to the latter ballet was furiously "modern" into the bargain. It is doubtful whether these last-mentioned productions or any of the still later ballets, however interesting as experiments, were as satisfying artistically or theatrically perfect as the early ones of Fokine and Bakst. "The Good-Humoured Ladies" and other clever little scenes, charming in themselves, have not gone much further aesthetically, and in 1920 the standard of the dancing and the performance of the music were not on quite so high a level as in the first years of production.

Ballroom Dancing.—In the ballroom a different kind of revolution has been effected by the introduction of new dances and music from America. The only dance that has survived this invasion is the valse, but even this dance has altered so much in style that it now bears very little resemblance to the dance immortalized by Edward and Johann Strauss. The steps are legion and ever changing with the style of the dancers. There are only three or four steps which are used by all couples and consequently make it possible for a man to dance with a new partner

and foodstuffs. The principal exports are timber and sugar. Large granaries and warehouses for sugar stand near the wharves of the port, which also affords storage capacity for over 20,000 tons of oil. Timber ponds are at Holm I. and extend for several miles along the bank of the Dead Vistula between Danzig and Plehnendorf.

The port has great commercial possibilities, the natural features of the waterways and surrounding country rendering expansion easy. The port is practically ice-free and is the only gateway to Poland. Thanks largely to the protection afforded by the peninsula of Hela, it has special advantages of security and development. The river Vistula from its source in the Carpathian mountains to its mouth at Schiewenhorst in the gulf of Danzig is 660 m. in length. Harmonious coöperation between the free city and Poland, resulting in security and the capital required for the expansion and development of the port, is essential to assure a prosperous future for the city and a corresponding benefit to Poland.

A constitution was drawn up in 1920 by duly elected representatives of the free city in agreement with the High Commissioner appointed by the League of Nations. This constitution was placed under the guarantee of the League of Nations and the free city was proclaimed on Nov. 15 1920. A treaty between the free city of Danzig and the Polish republic, negotiated by the principal Allied and Associated Powers (Article 104 of the Treaty of Versailles), came into force at the same time. By the Danzig constitution the Legislature is composed of a senate and a popular assembly. The senate consists of a president (who is the chief officer of the state), a vice-president, and 20 senators. The popular assembly consists of 120 deputies, elected by the universal, equal, direct and secret vote of all citizens, both men and women, who have attained the age of 20 years, in accordance with the principles of proportional representation. The League of Nations reserves the right of inviting the free city to introduce amendments to the constitution.

By the Treaty of Versailles Poland received the unrestricted use of the port, Polish imports and exports passing freely. The free city and Poland now form one customs area under the Polish customs tariff and legislation. The control and administration of the railway system within the free city (except that specially serving the port) and of direct communication between Danzig and Poland, as well as postal, telegraphic and telephonic communication via the port of Danzig between Poland and foreign countries, is given to Poland. German nationals ordinarily resident in the territory of the free city lost their German nationality on the coming into force of the Treaty and became nationals of the free city of Danzig. A diplomatic representative of the Polish Government stationed at Danzig acts as intermediary between the Polish Government and that of the free city. Poland undertakes the conduct of the foreign relations of the free city as well as the protection of its citizens abroad. Passports issued to nationals of Danzig require the visa of the representative of Poland in Danzig. The right to fly the Danzig merchant flag is restricted to ships owned exclusively by nationals of the free city. The Danzig port and waterways are under a board composed of an equal number (not exceeding five) of Danzig and Polish commissioners. Its president is of Swiss nationality, failing previous agreement between the Danzig and Polish Governments.

Of special interest to the British visitor may be mentioned the so-called "Englisches Haus," rebuilt in 1569 as a home for the London cloth merchants on the site of their former house; evidences of early communication between Great Britain and Danzig may be found in the "Englischer Damm" and in the quarters of the town still known as "Old Scotland" and "New Scotland." The High Commissioner appointed by the League of Nations occupies the residence of the former commander of the German troops.

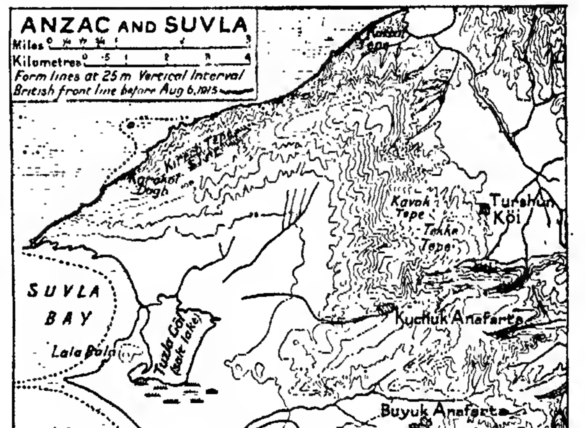
DARDANELLES CAMPAIGN, 1915.—The Dardanelles campaign of 1915 was brought about by a desire entertained during the early stages of the World War by the Allied Governments, and especially by the British Government, that communications should be opened up from the Mediterranean into the Black Sea. These communications had been severed on the Ottoman Empire throwing its lot in with the Central Powers three months after the commencement of the struggle. Russia had in consequence been virtually cut off from intercourse by water with the outer world, seeing that the Baltic likewise was closed owing to action of the German navy; no adequate outlet for the Russian Empire's produce remained available; the most promising avenue for the introduction of warlike stores into the Tsar's dominions from without had been effectually barred. The very fact of reëstablishing this vital strategical and economic artery of the Near East by force of arms would, moreover, of necessity carry with it the occupation of Constantinople by Entente forces and would deal a resounding blow at the very heart of the Sultan's realms. There was furthermore, at the juncture when the project of attack upon the Dardanelles was first seriously mooted at the beginning of Jan. 1915, a special inducement offered to the Allies for acting in this quarter—any threat to Stambul and the Golden Horn must tend to take pressure off the Russian army in Armenia which was at the moment believed to be in some peril.

War between Turkey and the Allies broke out at the end of Oct. 1914, following on several weeks of strained relations due to the reception of the German warships "Goeben" and "Breslau" within the Straits. Some British vessels carried out a brief bombardment of the Ottoman batteries at the mouth of the Dardanelles on Nov. 3, but the operation partook merely of the nature of a reconnaissance, and for some time hostilities were confined to a blockade of the Ottoman coasts,[1] defensive steps in Egypt, and the seizure of the Shat el Arab and Basrah.



To secure command of the maritime defile that links the Aegean with the Sea of Marmora was, in the opinion of most

[1] On Dec. 13 1914 the British submarine B11, Lt. Norman Holbrook, successfully passed the mine-fields of the Straits and torpedoed the old Turkish battleship "Messudieh" at anchor. Less fortunate, the French submarine "Saphir" was sunk in a similar attempt to penetrate the inner waters on Jan. 15 1915.

authorities, an almost indispensable preliminary to the undertaking of warlike operations against Constantinople and the Bosporus by fighting forces coming from the west. The question of the mastering of this all-important lower waterway in the event of a contest with the Turks had indeed engaged the close attention of British naval and military experts some years earlier. The conclusion arrived at on that occasion had, however, been that, whether the campaign were to take the form of a purely naval operation or whether the task were to be performed by an amphibious expeditionary force, the enterprise was bound to prove most difficult. In 1914 the channel was known to be defended by a number of batteries, some of them armed with very heavy guns. Most of these works were planted about the slender reach situated about 10 m. above the outlet into the Aegean, and known as the "Narrows." If the batteries and their artillery were somewhat out of date, the fact remained that warships steaming up the defile would be compelled to pass these fortifications at very close quarters, when the lack of range of their guns would cease to tell. The Ottoman authorities were moreover known to have given much attention to the problem of mine-fields especially adapted to the peculiar conditions existing within the Dardanelles; and the development which had taken place in this particular form of defence was such as to render the task of a fleet which should try to force the passage a more difficult one than it would have been a few years earlier. The fact that along the whole of its course this remarkable waterway is only separated from the Aegean by the attenuated Gallipoli Peninsula, did, on the other hand, suggest that the most promising method of attack upon the maritime defile from without would be to occupy that significant tongue of land.

An appeal reached the British Government from Russia on Jan. 2 1915 for help to relieve the existing situation in Armenia, and an operation directed against the Dardanelles was judged to be the best means of complying with the request; but there were no large bodies of troops available that could be used for such a purpose. The consequence was that the feasibility of forcing a way from the Mediterranean up into the Sea of Marmora as a purely naval undertaking came to be examined afresh in London. When asked for his views, Vice-Adml. Sir Sackville Carden, the British commander-in-chief in those waters, proposed that a fleet should try to destroy the Ottoman forts in the Straits and to clear away the mine-fields sown in the channel, by adopting a process of methodical advance. This plan possessed the merit of novelty. It had always been assumed during previous discussions on the question that warships adventuring the passage would try a rush, that they would endeavour to steam by the batteries and drive the defending gunners from their guns by concentrated fire. Although the professional chiefs at the Admiralty were not enthusiastic supporters of Adml. Carden's project, the Government decided to adopt it.[1] French concurrence was obtained, French support was promised, and measures were at once set on foot to concentrate such naval forces in the Aegean as appeared to be required for the execution of the plan.

A considerable armada was got together, although its assembling took several weeks and although the Russians had as a matter of fact heavily defeated the Turks in Armenia (battle of Sarikamish) even before orders for the assembling were issued. As regards large craft, the fleet consisted in the main of semi-obsolete battleships looked upon as unfit to take part in a fleet action. Of such ships the British contributed fourteen[2] and the French four.[3] But the fleet also included two semi-dreadnoughts ("Lord Nelson," "Agamemnon"), the battle-cruiser "Inflexible" and the newly completed "Queen Elizabeth," armed with 15-in. guns. The battleships were to be aided by several cruisers and destroyers and a flotilla of mine-sweepers was also organized. The conveniently situated islands of Tenedos and Lemnos[4] (the latter offering the immense land-locked haven of Mudros as an anchorage) were occupied to serve as naval bases, and on Feb. 19 the venture opened with an attack upon the weakly Ottoman batteries that guarded the outlet of the channel. The batteries were silenced for the time being; but bad weather interrupted the proceedings and the batteries had to be silenced afresh a week later (Feb. 25)—effectually on this occasion. That night the mine-fields at the mouth of the Dardanelles were cleared away, and battleships were in consequence enabled to penetrate into the lowest reaches of the defile on the morrow.

Stormy weather caused some delays in continuing the programme, but heavily armed vessels made their way a short distance up channel on several days early in March and engaged some of the enemy works that were sited about the Narrows.[5] The sweepers continued their labours night after night, gradually extending the fairway up which heavy craft could safely venture. Long-range fire on the forts directed from outside the Straits over the Gallipoli Peninsula was also tried, but the results proved disappointing. In reality, a very liberal expenditure of artillery ammunition on the part of the fleet was doing considerably less damage to the Ottoman defences than the Allied sailors imagined to be the case. Any Turkish battery that was chosen for target generally ceased firing before long; and the assailants were disposed to assume that the work was definitely put out of action, whereas all that had happened in reality was that the hostile gunners had been driven from their guns. Moreover, promising as the situation may have appeared to be from the attacking side in so far as neutralization of the Ottoman batteries was concerned, it was plain that the mine-sweepers were making disappointing progress. The enemy's light guns, aided by effective searchlights, were offering a strenuous opposition to the small craft engaged on the all-important duty of clearing the channel of submerged defences. At last Vice-Adml. Sir John Michael De Robeck, who had succeeded Adml. Carden, decided, under some pressure from home, to undertake an onset in full force upon the defences of the Narrows by day, although mine-fields still forbade a close attack on the forts on the part of battleships.

This operation took place on March 18, and it proved unsuccessful. Sixteen battleships entered the Straits to participate in the encounter, the manoeuvring of so large a number of great vessels in this narrow space was a matter of some difficulty and also gave excellent targets for the Turkish artillery, which replied to their fire with unexpected spirit. The contest lasted for several hours, but towards evening the fleet was obliged to retire, three of the battleships having been sunk and four others having been put out of action. The three vessels lost, the "Irresistible," "Ocean" and "Bouvet," were out of date; but of those put out of action the "Inflexible" was a modern ship, and she and another very nearly foundered before they could be got to a place of safety. The defenders employed mines drifting down with the current with striking success on this occasion, and the damage caused by them contributed largely to bring about the defeat of the naval force. The events of the day indeed clearly indicated that the enemy's underwater devices were an even more serious obstacle to the forcing of the Dardanelles than were the Ottoman batteries. Nor had the Allies grounds for supposing that drift-mines would not be met with, were the attack renewed.

After this experience Vice-Adml. De Robeck felt himself obliged to inform the Admiralty that the offensive against the Straits ought not to be continued as a purely naval operation of war. This necessitated a complete recasting of the Entente plans. The Turkish authorities, it may be mentioned,

[1] On the naval operations, see also the article NAVAL HISTORY OF THE WAR.

[2] "Queen," "London," "Prince of Wales," "Implacable" and "Irresistible"; "Majestic" and "Prince George"; "Cornwallis" (Duncan class); "Swiftsure" and "Triumph"; "Vengeance," "Albion," "Goliath" and "Ocean" (Canopus class). For the characteristics of these ships and of the "Lord Nelson" and "Inflexible" *see* 24.897.

[3] "Bouvet," "Suffren," "Charlemagne," "Gaulois."

[4] Lemnos was a Greek possession having been ceded to Greece as the result of the Balkan War of 1912-3. Imbros, Samothrace and Tenedos had remained Turkish.

[5] On March 10 Bulair was also bombarded from the Gulf of Saros.

on finding nearly all the ammunition for their heaviest ordnance in the Narrows to be used up, viewed the prospect of a possible fresh fleet attack with some apprehension, as they were under the impression that the assailants had been beaten off on the 18th by the guns and not by the mines. This led to a mistaken idea that De Robeck's ships might have succeeded had they renewed their attack at once in spite of losses; the damage which they had done to the batteries had been almost insignificant, and they had not got within 5 m. of their objective.

The Allies had foreseen from the outset that land forces would have to be brought into play sooner or later in their campaign in this region. Even assuming that the fleet forced the Dardanelles, its communications would have to be safeguarded, and there would still be Constantinople and the Bosporus to be dealt with. Entente troops had already before March 18 been set in motion for the Aegean, and some were in Lemnos. A heterogeneous army, drawn largely from India and Australasia, had also been gathering in Egypt for several weeks past, of which portions could he made available for work elsewhere in the Near East. Gen. Sir Ian Hamilton, who had heen chosen as commander-in-chief of the military contingents that were to coöperate in due course with the naval forces in this theatre of war, had moreover actually arrived on the day before the abortive fleet attack upon the Narrows and had witnessed the fight. In view of what had occurred the Allied Governments decided that in further operations full use must be made of the gathering army, and from this time onwards the military began to assume the principal rôle in the effort of the Entente to secure command of the Dardanelles.

But Sir Ian Hamilton judged it to be inexpedient to initiate land operations at once. Reconnaissance had brought to light the extent to which the Turks were making preparations to repel attempted landings, both on the Gallipoli Peninsula, and on the Asiatic coast adjacent to the mouth of the Straits; and everything pointed to the expeditionary force having to start work by fighting its way ashore. A tactical operation of that character demanded most careful prior organization, and it called for a distribution of the attacking force amongst the available shipping based on purely tactical considerations. As a preliminary to his undertaking a serious land campaign on the shores of the Aegean, the general felt himself obliged to concentrate his forces in Egypt, and to prepare them there for the hazardous undertaking to which they were to be committed. A month was lost in consequence.[1] During that month the Turkish V. Army was formed (March 24) to guard the Straits, and Marshal Liman von Sanders, head of the German military mission in Turkey, was appointed its commander-in-chief. Between the last days of March and the day of the landing the defence system was overhauled and greatly developed.[2]

The Franco-British expeditionary force was to be composed of seven divisions—three, the 29th, the 42nd and the Royal Naval, furnished by the United Kingdom, two formed of Australian and New Zealand troops, and two composed of French colonial troops. At the time however when active operations began the 42nd Division and one of the French divisions could not be counted on owing to shipping for them not being available. Against this force Liman von Sanders could at the outset pit six divisions. Hamilton had resolved on making the Gallipoli Peninsula his objective, intending to secure high ground which dominated the Narrows from that side. He could conceal his design up to the very last. His adversary had perforce to disperse the defending troops, so that on the morning when the land campaign started two of the Turkish divisions (3rd and 11th) were watching the outer coast on the Asiatic side, two (5th and 7th) were near Bulair to provide against a landing at the neck of the Peninsula, while the remaining two (9th and 19th) under Essad Pasha guarded the places where, in the event, the Allied army made its appearance. Still, if the attacking side enjoyed an advantage in this respect, the possible landing-places were few in number and were therefore well indicated, there had been ample time to protect them with earthworks and barbed wire, and in any disembarkation in face of resistance the tactical conditions favour the defence.

Hamilton contemplated two distinct major operations. One force was to be put ashore about the extremity of the peninsula—an area which it is convenient to designate as "Helles." The other force was to land N. of Gaba Tepe, where there are extensive beaches. Part of the one available French division was, furthermore, to effect a descent at Kum Kale opposite Helles as a subsidiary operation, partly to deceive the enemy and partly to neutralize Turkish guns, which otherwise might intervene in the Helles fighting. Feints were also to be carried out at other localities so as to bewilder the defenders. The effort at Helles was to be entrusted to the 29th Division, supported by the Royal Naval Division, and ultimately to be reinforced by the French division. That at Gaba Tepe was to be carried out hy the two Australasian divisions under Gen. Sir William Birdwood. The Anglo-French army concentrated in Mudros Bay, the great natural harbour of Lemnos, in the third week of April and, after a short delay enforced by bad weather, the armada put to sea during the nights of the 23rd–24th and the 24th–25th, so that the transports and the covering warships should arrive at the various rendezvous at or before dawn on the 25th. The day broke calm and still, after a placid night.

A firm footing was gained on shore by the assailants at three out of the five points where disembarkation was attempted, while the effort was also, within restricted limits, successful at the two remaining points. The beaches which had been selected were, enumerating from right to left, "S" in Morto Bay, "V" and "W" on either side of Cape Helles at the south-western end, and "X" and "Y" on the outer shore; "V" and "W" were regarded as of primary importance, as those two beaches offered suitable landing places from the point of view of subsequent operations. The attacks at "S" and "Y" were intended to be subsidiary; but great importance was attached to that at "X" owing to the vicinity of this point to "W." The troops started for the shore in flotillas of boats soon after dawn at all points, their approach covered by the fire of battleships and cruisers, and in all cases the boats were not fired upon until almost the last moment.

As it turned out, the actual disembarkations at "S," "X" and "Y" were carried out without any very great difficulty; but the troops detailed for "W" beach only gained a footing after incurring very heavy losses and by a display of indomitable resolution, while at "V" the operation went very near to failing altogether. In the general scheme of attack the landing at this last point was of primary importance; the largest force had been detailed for it, and the troops were for the most part conveyed to the beach in a steamer (the "River Clyde") which was run ashore; but only some scattered detachments cowering close to the water's edge had established themselves on land by nightfall, and the Allies' position here seemed to be highly critical. The troops detailed for "Y" beach had also got into serious difficulties, and as it turned out they had to be withdrawn next morning. But the forces which had landed at "W" and "X" beaches had joined hands, the one battalion detailed for "S" beach had secured a good position, and during the night the troops still

[1] The chief naval incidents of this month were:—a raid by the Turkish destroyer "Demir Hissar" which sank the British transport "Manitou" on March 16, but had to be blown up next day off Chios to avoid capture; an attempt of the British submarine E15 to enter the Straits, which led to her being forced ashore (April 16) and in the sequel to her destruction by a daring boat's crew from the "Majestic" (April 18); bombardments of the defences of Smyrna on March 28, April 6 and April 22; and operations at Gaza and El Arish on the Syrian coast by the French battleship "St. Louis" and other vessels (April 12–17).

From the Black Sea the Russian naval forces bombarded the Bosporus defences on March 28; some fruitless operations were then carried out against the "Goeben" and "Breslau" (in the course of which the Turkish cruiser "Medjidieh" was sunk off Odessa (April 3), and on April 25, the day of the landing in the Peninsula, and on May 2, the Bosporus defences were again shelled.

[2] The coast defences themselves remained under the command of the German Adml. v. Usedom, who was also responsible for those of the Bosporus. The German naval forces were commanded by Adml. Souchon, who had brought the "Goeben" and "Breslau."

left aboard the "River Clyde" contrived to disembark. The resistance offered by the Turks had been most determined, and these could reckon upon receiving welcome reinforcements within a few hours; for as soon as the situation declared itself Liman von Sanders had hurried off one of the two divisions (the 7th) at Bulair by water with orders to repair to Helles.

In the meantime a French brigade had, after a tough struggle, effected a lodgment at Kum Kale. The Turks were in strong force in that quarter, and, as the hours passed and the defenders (3rd and 11th Divs.) massed, the situation became such as to render any French advance out of the question; indeed, but for the fire of the warships the troops who had landed could barely have maintained themselves. Still, their presence on the Asiatic side of the Straits was for the time being indirectly helpful to their British comrades who were struggling for a grip on the extremity of the Gallipoli Peninsula.

The invaders of Helles had secured but a precarious foothold on Ottoman soil by the morning of the 26th, twenty-four hours after starting operations; but fair progress was made by them during the course of this second day. What was left of the force originally detailed for the landing at "V" beach contrived during the early hours by stern fighting to occupy some high ground hard by, and also to join hands with the troops landed at "W" beach. Additional infantry was got ashore at "W" and "X" beaches, the first elements of the French division began disembarking at "V" beach in the afternoon, and before evening touch had been gained with the battalion that had made good at "S" beach. That night the French evacuated Kum Kale by arrangement. On the 27th a general move forward took place, the Turks (9th Div.) offering little opposition, and by nightfall the Allies held a line stretching approximately from the north end of Morto Bay to "Gully" beach. But very heavy losses had been sustained by the 29th Division, large bodies of Turkish troops had arrived from Bulair and were being brought round from the Asiatic side of the Straits,[1] and after three days of strenuous combat the British and French had barely secured a depth of 2 m. of country, while their opponents had had time to concentrate their scattered forces. Realizing the urgent need of gaining ground before the enemy was gathered in full strength, and hoping to win the heights beyond Krithia and Achi Baba, Sir I. Hamilton ordered a further attack for the 28th. On this occasion the Turks made a determined resistance; but the Allies' line was advanced by a few hundred yards at most points, and a three days' lull then ensued in the Helles area.

While this embittered struggle had been in progress at the extremity of the peninsula, stirring events had been in progress on its outer coast-line. The arrangements for disembarking Birdwood's Australasians differed from those made at Helles, in that here the whole force was to land at one point, and that an attempt was to be made to effect a surprise just before dawn (April 25). The surprise was effected, but in the darkness the force arrived at a locality about a mile N. of the beach immediately N. of Gaba Tepe which had been the selected goal. The beach on which the landing took place proved to be satisfactory, but it lay at the foot of a steep and rugged declivity, which was therefore a most unsuitable place for putting ashore the stores and impedimenta of an army. At the moment of approach of the first boats the defenders actually on the spot were few, so that the high ground overhanging the landing place (which came to be known as Anzac[2] Cove) was secured by the assailants at the first rush. But the enemy speedily brought effective flanking artillery fire to bear on the beach and on the boats; the troops, both officers and men, were inexperienced, the ground to be advanced over was hilly, scrub-clad and extremely broken, and considerable confusion arose. The advantage gained in the first instance by the surprise was lost, and the Turkish 19th Div. was able to gather in force during the critical hours of the morning when the Australasians might, in virtue of their superior numbers, have secured a satisfactory sector of ground. At the end of the day, although the whole of Birdwood's infantry had been ashore for several hours, the position which these troops had taken up remained a haphazard one, no depth had been secured, losses had been heavy, and the situation seemed so threatening that the question of a withdrawal was even considered at one time.

Reinforced by parts of the two Bulair divisions the Turks delivered vigorous counter-attacks on the 26th; but these were beaten off, and on that day and on the morrow the Australasian troops dug themselves in so thoroughly that by the night of the 27th–28th the position which they had taken up, such as it was, was reasonably secure. On the other hand, the Turks, who were commanded by Essad, had likewise dug themselves in, and they could bring an effective artillery fire to bear on the Anzac trenches from three sides, the prospect of the landing force making any effective progress under the awkward conditions of ground in which it found itself was remote, and Birdwood's contingents had in reality been even less successful than had those detailed for Helles as regards securing an adequate area on the enemy's shores before the defence gathered strength. Their situation was unsatisfactory not only in the tactical sense, but also from the point of view of keeping the troops supplied, owing to their being perched on ridges with steep gradients behind them. Watei also was found to be scarce, and was sure to become scarcer during the summer months. Lastly, the landing place was much exposed in the event of bad weather.

Although his adversaries had fought their way ashore in two sections of the Gallipoli Peninsula—and he had had to give up his first idea of driving them back to their ships—Liman von Sanders had no grounds for despondency when May opened. The Allies' plan was now unmistakably indicated, and concentration of the defending forces had become possible in consequence. The marshal's Turks had fought gallantly in the strenuous encounters which had taken place, and large reinforcements (2nd, 4th, 13th, 15th, 16th Divisions) were on the move or preparing to move to his aid. His troops were entrenching themselves solidly in face of the invaders both at Helles and at Anzac, so that his antagonists would be obliged to storm lines of earthworks whenever they should attempt to make further progress. It is true that Hamilton was expecting the arrival of the 42nd Division and of the 2nd French Division within a few days; but his losses had been extremely heavy, there were no depôts at hand from which these losses could promptly be made good, and he was inferior to the Turks in artillery both as regards calibre of guns and as regards ammunition. On three successive nights from the 1st to the 3rd the Turks delivered resolute assaults upon the Allies' position at Helles, but they were repulsed on each occasion; they also on the night of the 2nd–3rd launched attacks upon the Australasians, the combat lasting into the next day, but here also they were beaten off.

Two brigades of Birdwood's force were thereupon temporarily transferred to Helles by night, and on the 6th and following two days a mighty effort was made by the invaders to push forward in this southern area and to win the high ground that stretches across the peninsula about 5 m. from its extremity; their front was, however, only advanced by a few hundred yards and a much more pronounced success was called for to render the Allies' position in this area at all a promising one. Much work was done in organizing the area and its communications and landing places, but the tactical situation at Helles remained stationary for the rest of the month. At Anzac similar work was done but the only tactical incident of much importance in that quarter was that Liman von Sanders personally directed a formidable attack upon Birdwood on the night of the 18th–19th, the assailants being defeated with severe loss.

The arrival of German submarines[3] during this month proved

[1] The German commander of the 5th Div. (Lt.-Col. v. Sodenstern) was put in charge of the Helles front, Essad taking command on the Ari Burnei front.

[2] The abbreviated designation of the "Australian and New Zealand Army Corps."

[3] Already a special German submarine command had been established in the Adriatic, with bases at Pola and Cattaro, and some small boats were sent thither by rail. Two of these (UB1, UB15) were attached to the Austrian submarine force. Three

to be an event of lasting importance. Two British battleships were sunk off the peninsula (" Triumph " May 25, " Majestic " May 27), and owing to the risks run by warships and transports while in the open the Allied troops on shore were thenceforward almost deprived of support from naval gunfire, while reinforcements and stores were mostly brought frnm Mudros to the various landing places in small craft. Hamilton made Imbros his headquarters, and troops also were sometimes collected there owing to its vicinity bnth to Helles and to Anzac. Within the Dardanelles the battleship " Goliath " had been torpedoed by the Turkish destroyer " Muavenet-i-Milliye " on May 13; on the other hand British submarines were performing invaluable service, diving under the mine-fields, causing havoc amongst enemy craft in the channel itself and higher up, and threatening Ottoman communications with the peninsula.

That the position of affairs had become one virtually of stalemate was fairly evident to all authorities on the side nf the Entente before the end of May. A Russian army destined for the Bosporus, which had been gathered near Odessa, obliging the Porte to keep strong bodies of troops about Constantinople, had been called to Galicia, thus liberating several Turkish divisions for service at the Dardanelles. Only by dispatching very substantial reinforcements in men, munitions and war material to the scene could the Entente achieve its object. But the military situation elsewhere forbade the alloc tion of strong British or French contingents to this secondary theatre of war, and there was much delay in London in forming a decision. The 52nd Division was, however, under orders to proceed from England to the Aegean; it arrived at Helles early in June, where there was some severe fighting during that month by which the Allies somewhat improved their position.

But trench warfare was the order of the day, and the British and French were trying to carry this on without that ample artillery support which is almost indispensable when earthworks have to be stormed under modern tactical conditions. A general attack was delivered on the Ottoman positions on the 5th, by which some little ground was gained along most of the front. Then on the 21st the French, who were on the right next to the Straits, pushed their line forward as the result of a well-planned local offensive, and this achievement was followed up on the 28th by a successful operation on the part of the British on the extreme left, by which the line at that end was advanced to nearly abreast of Krithia. Satisfactory as were the results of these two affairs at the end of the month from the point of view of the Allies, they did not render their situation at the extremity of the peninsula much less discouraging than it had been before. The front occupied by the invaders at the end of June was indeed for all practical purposes to represent the line that was to be held up to the night of Jan. 8 in the following year. The Turks still occupied all the high ground. They continued to enjoy all the topographical advantage in respect to position. Ottoman guns dominated the entire territory which the invaders had succeeded in the course of two months in conquering, as well as " V " and " W " beaches which were the landing-places chiefly used by them. This Turkish artillery was bearing upon Helles not merely from the uplands facing the Allies' front line, but also from the Asiatic side of the Dardanelles on the Allies' flank. At Anzac the situation remained stationary during June, although there was some sharp fighting at the end of the month.

Both sides, it should be mentioned, were suffering much from sickness, and continued to suffer all through the summer. The heat was great. Flies swarmed. The dust caused much annoyance whenever there was any wind. The British hospital arrangements were not beyond criticism. The water question caused no great difficulty at Helles, but the very limited local supply found within the contracted area occupied by Birdwood's force gave out almost entirely when the dry season set definitely in, and much of that which was brought by sea or condensed had to be conveyed up steep inclines to the trenches. As a result of disease, and of casualties in action and from bombardment, the British divisions recruited in the United Kingdom were constantly far short of establishment, no proper provision having been made for keeping them up to strength. The two Australasian and the two French divisions were better off in this respect; but the number of divisions under Sir I. Hamilton's orders—eight now that the 52nd had arrived—in reality gave a very misleading impression of the strength of the force; his Majesty's Government had, however, during the course of the month decided to dispatch large reinforcements to this theatre of war, and the Allied commander-in-chief had been cheered by the tidings that five further divisions, the 10th, 11th, 13th, 53rd and 54th, had been placed under orders for the Aegean, and would join him between July 10 and Aug. 10. The number of Turkish divisions within the peninsula and in reserve on the Asiatic side of the Straits had, however, grown, and by the end of June Liman von Sanders appears to have had nine under his orders.

July, in so far as the Allies were concerned, was in the main a month of preparation. In view of the anticipated arrival of substantial reinforcements from England there was no great temptation to embark on offensives; and owing to the shortage of artillery ammunition, what there was of it had to be jealously husbanded, although the French divisions were not suffering from this disability so much as the British. A general attack was, however, delivered by the Helles force on the 12th and 13th along the right half of its front, and some little ground was conquered; but the situation was not appreciably modified. Towards the end of the month the 13th Division, the first of the new divisions to arrive, disembarked in this southern area as a temporary measure, bringing welcome relief for the troops in the trenches. At Anzac July passed off quietly. There the rival forces were in close contact, the Turks everywhere enjoying the advantage of command; some sections of the Australasian line were, indeed, completely overlooked by ground in Ottoman occupation. Liman von Sanders was joined by reinforcements from other parts of the Empire early in the month, and the number of Turkish divisions in the peninsula swelled; but, aware that additional British troops were arriving, he felt obliged to

nthers (UB3, UB7, UB8) sailed for the Straits in the latter part of April. UB3 was lost *en route* but nos. 7 and 8 reached the Straits about the middle of May. They proceeded to Constantinople, and were chiefly employed against the Russian Black Sea fleet. Four small boats of the mine-laying class were also dispatched, of which three (UC14, UC13, UC15) made their way to Constantinople, carrying important technical stores, in the summer months after an intermediate base had been established at Orak near Budrun. Another small boat (UB14) on its way from Orak to the Straits, torpedoed the British transports " Royal Edward " off Cos (Aug. 14), and " Southland " in the Aegean (Sept. 2). Other British transports sunk in the Aegean were the " Ramazan " (Sept. 19) and the " Marquette" (Oct. 26). Of the ships named only the " Southland " was brought into harbour.

More important work was done by the seagoing boat U21, Lt.-Comm. Otto Hersing. This left the Ems after special preparation fnr the long voyage, on April 25, and reached Cattaro with only half a ton of fuel left on May 13. After replenishing at that base, Hersing sailed on the 20th for the Dardanelles, where, on the 25th and 27th he sank the battleships " Triumph " and " Majestic." U21 then proceeded to Constantinople. On July 4 he came out and sank the French transport " Carthage " off Helles; later after a cruise in the Aegean he tried to reënter the Straits, but finding the British mine defences too formidable, he sailed to Cattaro to take part in the general commerce-destroying warfare in the Mediterranean. This was by now active, four other seagoing boats having followed U21 from the North Sea, and it is claimed that 50,000 tons of shipping were sunk in the Mediterranean and Aegean during Sept. 1915. At the end of that month the Germans had nearly one-third of their total available submarine force in this theatre—14 boats out of 44—of which 5 seagoing, 2 small and 1 mine-laying boats, were working in the open, and 3 small (UB7, 8, 14) and 2 mine-laying (UC13, 15) at Constantinople. In addition, the Austrian boats numbered about 11, large and small, and one of these torpedoed the French cruiser " Leon Gambetta " in Ionian waters on April 27.

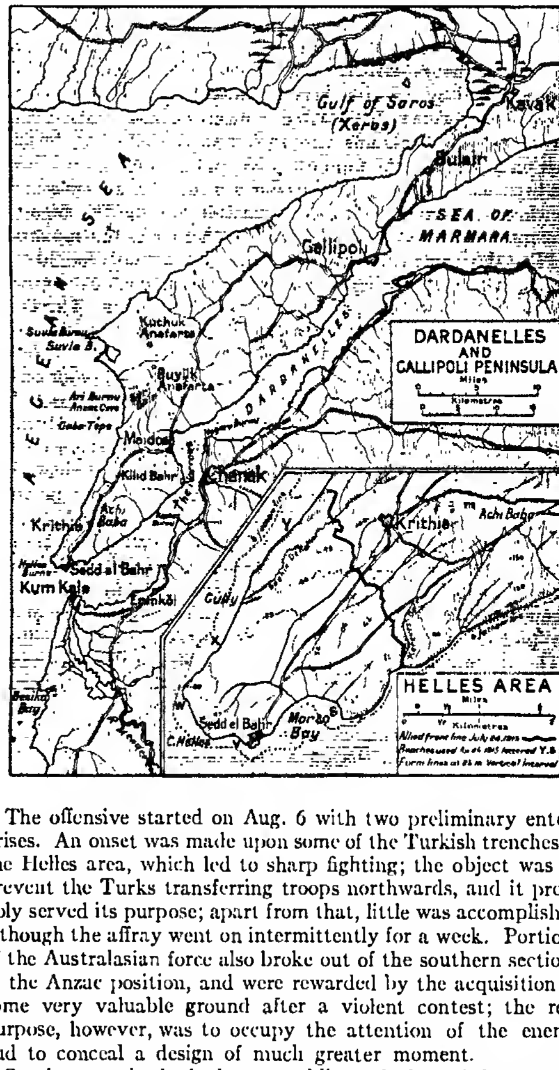
Submarine activity in the open Mediterranean and Aegean had nn small influence in determining the final abandonment of the Gallipoli enterprise and in preventing its resumption in the later stages of the war. But locally and tactically, no real success was obtained by the new arm after the departure of U21. Liman von Sanders expresses the opinion that the German submarines on the spot were of no assistance to him, and that the British boats, in spite of their frequent raiding of the Sea of Marmora, did not seriously interfere with his water movements.

leave forces on the Asiatic side of the Dardanelles in case of a hostile landing on the coast to the S., and of the divisions on the peninsula he kept two about Gallipoli and Bulair.

How best to utilize the fresh troops joining him from England was anxiously considered by Sir I. Hamilton, and he framed his plans well in advance. The French had from the outset favoured operations on the further side of the Straits, and the expediency suggested itself of either throwing the whole Allied army in that direction, or else of diverting the reinforcements thither as a detached contingent. But there were valid objections to either course. A descent S. of the Straits connoted disembarkation in face of opposition, and, even supposing the landing to be successful, the force would start work much further from the Narrows than were either Helles or Anzac. Then again, to plant down a portion of the Allied troops on one side of the Straits, while continuing operations on the other side, would mean voluntary dispersion of resources in place of concentration. The commander-in-chief weighed the pros and cons and he decided against a combination of war on such lines. There were also not wanting inducements for the Allies to attempt a landing near Bulair, seeing that a victory at that point would carry with it the severance of the Turkish land communications with the peninsula. But, here again a disembarkation in face of opposition would have to be risked and a dispersion of resources would arise, while there were strong objections from the point of view of ship transport to conveying troops to a point so distant from the island of Imbros as Bulair; for Imbros was to be utilized as the principal concentration point for the reinforcements from England. That the Ottoman commander-in-chief had to be prepared for his opponent adopting one of these two plans offered a strong argument against adopting either of them.

Hamilton decided that his great effort should be made at, and immediately to the N. of, Anzac. The rugged bluffs on which Gen. Birdwood's force had taken root since April were spurs of a tangled mountain mass known as Sari Bair, from the topmost ridges of which the Straits about the Narrows were partially visible at a distance of 4 or 5 miles. The occupation of these topmost ridges must greatly assist in a further advance across the peninsula here at its narrowest point. The plan decided upon was secretly to augment the force already at Anzac by about a division and a half, and, with the force thus augmented, to secure possession of Sari Bair by a night-attack. But this was only part of the plan. It was also decided that a force of nearly two divisions should, on the same night as the attack on Sari Bair was launched, effect a landing at an entirely new point—Suvla Bay, a few miles N. of Anzac, where the Turkish troops were known to be few. The object of this second operation was twofold—it would indirectly assist the offensive against Sari Bair, it would also furnish the Allies who were planted down on the outer coast of the peninsula with a much more sheltered landing place and base than Anzac Cove. The 13th Division, with some other detachments from Helles and with one brigade of the 10th Division, were the troops chosen to augment Birdwood's force already at Anzac. The new venture further north was entrusted to the 11th Division, which was to assemble in the island of Imbros supported by the rest of the 10th Division; the portions of this latter division not detailed for Anzac were to concentrate partly at Mudros, and partly in a port of Mitylene more than 100 m. from Suvla. The last divisions to arrive, the 53rd and 54th, were to be employed wherever should seem best after the offensive had begun. To land the whole of the reinforcements simultaneously would not have been practicable with the amount of water transport available.

The utmost secrecy was observed by the Allied staff. Appropriate steps were taken to mislead the Ottoman authorities by means of feints and of reconnaissances executed at localities other than those selected for operations. False reports were assiduously circulated by the intelligence department. This part of Hamilton's programme was, indeed, carried out most successfully, for, although Liman von Sanders was aware of the arrival of large bodies of British troops in the islands, he remained entirely ignorant of his rival's real design until this was actually in execution. The Ottoman commander had organized his forces as a southern group watching Helles and a northern group watching Anzac, with the already mentioned two divisions at the Bulair end of the peninsula. There were large Turkish forces in reserve about Chanak, in addition to substantial contingents disposed to the S. of the outlet of the Straits ready for any move of the Allies in that quarter; but, thanks to a system of jetties erected on either shore at the upper end of the Narrows, and to improved communications, troops could be shifted from side to side of the waterway very rapidly. Numerically, the contending armies would at this very critical juncture of the campaign be almost equal, the invaders rather the stronger; but the Turks were much dispersed, so that the result almost hinged upon the speed with which the attacking side should gain ground before the defenders had time to concentrate.



The offensive started on Aug. 6 with two preliminary enterprises. An onset was made upon some of the Turkish trenches in the Helles area, which led to sharp fighting; the object was to prevent the Turks transferring troops northwards, and it probably served its purpose; apart from that, little was accomplished although the affray went on intermittently for a week. Portions of the Australasian force also broke out of the southern sections of the Anzac position, and were rewarded by the acquisition of some very valuable ground after a violent contest; the real purpose, however, was to occupy the attention of the enemy aud to conceal a design of much greater moment.

So dexterously had the assembling of the reinforcements within Birdwood's position been effected, that the Turks had entirely failed to detect how the numbers of their opponents in this area had during the last few nights been nearly doubled. The scheme of operations for the capture of the Sari Bair mountain mass was that the force detailed for this enterprise should move out in several columns from the northern end of the Anzac position along the low ground near the shore, after dark on the evening of the 6th On reaching their appointed stations the columns were to wheel to the right and were to work their way up certain steep but well-defined gullies that led towards the

topmost ridges, which, it was hoped, would be reached by daylight—a somewhat sanguine anticipation, as it turned out. All went well at the outset. The Turkish posts about the lower spurs were in some cases surprised. The outlets of the gullies were in the assailants' hands soon after midnight. The hostile detachments on guard gave way at all points. But the routes to be followed were difficult to find in the dark, the ascent was rapid, the ground was much broken, and the enemy opposed a stubborn resistance to the advance, with the result that this was greatly retarded, and that at daybreak the most forward of the columns was not much more than halfway up. The Ottoman staff had, moreover, on the first alarm begun to hurry reinforcements on the Sari Bair from the rear, while the Allied troops were so much exhausted by their nocturnal experiences that all attempts to win the upper ridge failed on the 7th.

A rearrangement of the attacking forces was carried out during the following night, and the attempt to gain the highest ground was resumed at dawn on the 8th from the positions that had been acquired 24 hours earlier. The Ottoman detachments on the mountain had by this time been reinforced by at least one division, and they were fully prepared to meet the onset when it came. One of the Allies' columns nevertheless succeeded in establishing itself on a patch of the topmost ridge and in holding on to what had been secured, although the efforts of the assailants miscarried elsewhere. After a fresh reorganization during the night an attempt was yet again made on the 9th to win the mountain, and that day some British and Indian troops actually fought their way on to a commanding summit from which the Narrows could be seen, only, however, speedily to be driven off again. The Turks holding the ridge were, moreover, constantly receiving reinforcements now that Sir I. Hamilton's plan was completely exposed, and so victory definitely decided itself in favour of the defenders early on the 10th. For these, by a sudden onset that morning, recovered possession of the patch of high ground which their antagonists had succeeded in wresting from them on the 8th and in holding ever since. Then, by a resolute if somewhat costly counter-attack delivered from the dominating position which they occupied, the Osmanlis thrust those opposed to them back down the slopes all along the line and could fairly claim to have gained the upper hand. Strenuous fighting thereupon ceased. Both sides had suffered very severely in the furious encounters that had been in progress since the evening of the 6th, and the troops were completely worn out by their efforts.

The attempt to secure Sari Bair thus failed, and the carefully devised scheme by which the invaders had hoped to establish themselves in a dominating position in the Anzac region at almost the narrowest portion of the Gallipoli Peninsula fell to the ground. It is true that as a result of the operations the area in occupation of the Allies in this quarter had been greatly extended in a northerly direction, so much so indeed that little difficulty was experienced by Gen. Birdwood in securing close contact with the contingents that had landed at Suvla on the night of the 6th–7th, and from which substantial support had been expected. As a matter of fact, the Suvla troops had afforded the Anzac columns no assistance at all beyond occupying the attention of one of the two Turkish divisions which Liman von Sanders set in motion south-westwards from about Gallipoli as soon as he had satisfied himself as to where danger lay, and the doings of this newly landed force had now to be recorded.

The plans for bringing the 11th Division and bulk of the 10th Division from the islands to Suvla and disembarking them had been elaborated with meticulous care by the naval and military staffs. As Turkish detachments watching this strip of coastline were known to number only about 2,000 men—the Ottoman authorities never contemplating a hostile landing in force in the locality—the design was to put most of the attacking troops ashore during the night of the 6th–7th as a surprise, and that they should then push on at once and master a range of hills 4 or 5 m. to the east. At Suvla Point the coast (which from there down to about Helles runs roughly N. and S.) turns abruptly to the N.E. to form one side of the Gulf of Saros; along this stretch of the shore a well-defined ridge, starting close to the headland, rises almost like a wall from the sea and overlooks what may be called the Suvla area from the N., just as the above-mentioned range of hills overlook the area from the east. The area is mostly flat up to the foothills. Close to the bay there is a lake—a marsh in dry weather—which necessarily cramped the movements of troops landed at or near the bay. Army headquarters assumed that the plain, with the high ground to the E. and N., would be in British hands early on the 7th.

The 11th Division from Imbros was to disembark first, and was to be on the right in the subsequent advance. The 10th Division from Mudros and Mitylene was to follow it ashore, and, moving forward on the left, would secure the northerly ridge. Most of the 11th Division was to land just S. of the bay, but one brigade was to gain its footing inside the bay. The work was to begin as early as possible, allowing for the flotilla only quitting Imbros after dark. Especially constructed lighters, with motor power, were to play an important part in the disembarkations, a number of them having recently arrived from England. Elaborate arrangements had been made for water supply to the troops ashore, as the whereabouts and the capacity of wells were doubtful. The secret had been well kept, and a difficult operation of war was in its opening stages most successfully carried out.

The two divisions detailed for this Suvla enterprise both belonged to the British "New Army"; they were unconversant with active service conditions, having come straight out from England, and they were being highly tried in being called upon to execute a landing in force at night in face of opposition. There was, indeed, no precedent for an undertaking of this kind under modern tactical conditions. Nevertheless the whole of the infantry of the 11th Division was on shore before dawn, and its leading battalions had driven off the Turkish detachments met with in the immediate vicinity of the points of disembarkation. The only hitch that had occurred during the night-time had been at the landing-place within the bay, where the water had proved to be inconveniently shallow for the lighters; this had created some confusion and delay. But the urgent need of pressing forward at once was not realized by the attacking side, and the opposition offered by the parties of Osmanlis close to the bay was taken too seriously after daylight. Moreover, when the first portion of the 10th Division arrived from Mitylene soon after dawn, it was decided to put these troops ashore to the S. of the bay, instead of inside the bay as had been intended; so that they found themselves, to start with, on the right of the 11th Division and not on its left, the general line of contemplated advance being to the N. of the lake. They were unfortunately moved from right to left, and this took many hours.

During the forenoon a good landing place was found inside the bay on its northern side, and the contingent of the 10th Division from Mudros disembarked at this point. But no vertebrate advance in force took place until comparatively late in the afternoon, and by evening the attacking side, although enjoying a great numerical superiority, had only reached the foot of the hills that lay to the E. of the landing-places and captured one advanced spur. The troops had during the latter part of the day suffered greatly from thirst, the arrangements with regard to water having practically broken down mainly owing to the inexperience of the troops themselves.

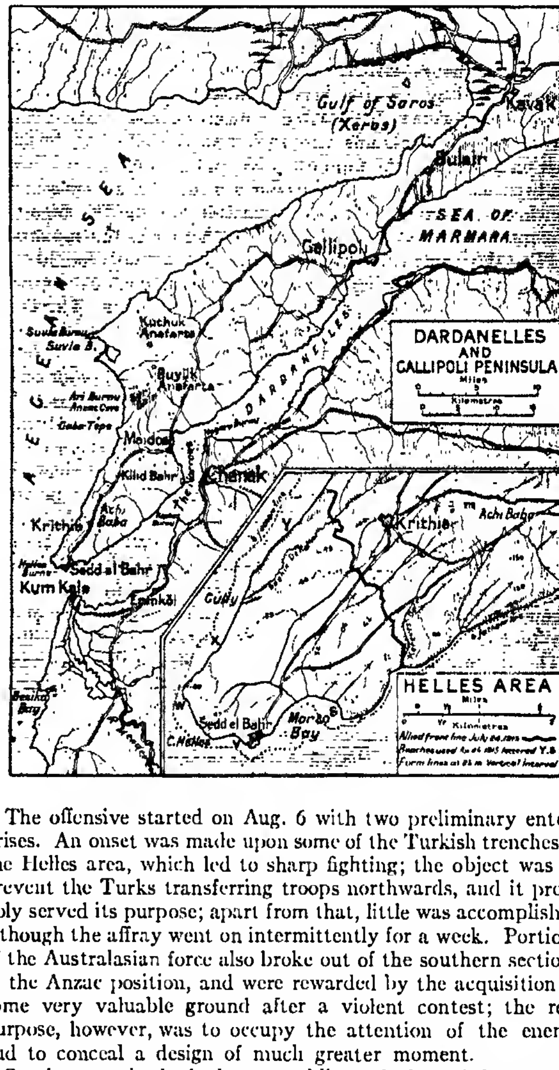
When Liman von Sanders (who had fixed his headquarters near Gallipoli) learned during the night of the 6th–7th that the Allies were landing in strong force about Suvla, and were also attacking Sari Bair from Anzac, and after he had satisfied himself that certain threats on the part of his opponents at other points might be regarded as mere feints, he ordered the two Turkish divisions under his immediate orders to proceed towards Suvla with all speed. This, however, meant a two days' march along indifferent roads. The only Ottoman detachments which during the 7th and 8th confronted the two British divisions that had made a descent on this locality were those which had been on guard on the spot when the landing was taking place. Consequently there was still on the 8th a great opening left for the attacking side to complete the first part of its programme, *i.e.* to

leave forces on the Asiatic side of the Dardanelles in case of a hostile landing on the coast to the S., and of the divisions on the peninsula he kept two about Gallipoli and Bulair.

How best to utilize the fresh troops joining him from England was anxiously considered by Sir I. Hamilton, and he framed his plans well in advance. The French had from the outset favoured operations on the further side of the Straits, and the expediency suggested itself of either throwing the whole Allied army in that direction, or else of diverting the reinforcements thither as a detached contingent. But there were valid objections to either course. A descent S. of the Straits connoted disembarkation in face of opposition, and, even supposing the landing to be successful, the force would start work much further from the Narrows than were either Helles or Anzac. Then again, to plant down a portion of the Allied troops on one side of the Straits, while continuing operations on the other side, would mean voluntary dispersion of resources in place of concentration. The commander-in-chief weighed the pros and cons and he decided against a combination of war on such lines. There were also not wanting inducements for the Allies to attempt a landing near Bulair, seeing that a victory at that point would carry with it the severance of the Turkish land communications with the peninsula. But, here again a disembarkation in face of opposition would have to be risked and a dispersion of resources would arise, while there were strong objections from the point of view of ship transport to conveying troops to a point so distant from the island of Imbros as Bulair; for Imbros was to be utilized as the principal concentration point for the reinforcements from England. That the Ottoman commander-in-chief had to be prepared for his opponent adopting one of these two plans offered a strong argument against adopting either of them.

Hamilton decided that his great effort should be made at, and immediately to the N. of, Anzac. The rugged bluffs on which Gen. Birdwood's force had taken root since April were spurs of a tangled mountain mass known as Sari Bair, from the topmost ridges of which the Straits about the Narrows were partially visible at a distance of 4 or 5 miles. The occupation of these topmost ridges must greatly assist in a further advance across the peninsula here at its narrowest point. The plan decided upon was secretly to augment the force already at Anzac by about a division and a half, and, with the force thus augmented, to secure possession of Sari Bair by a night-attack. But this was only part of the plan. It was also decided that a force of nearly two divisions should, on the same night as the attack on Sari Bair was launched, effect a landing at an entirely new point—Suvla Bay, a few miles N. of Anzac, where the Turkish troops were known to be few. The object of this second operation was twofold—it would indirectly assist the offensive against Sari Bair, it would also furnish the Allies who were planted down on the outer coast of the peninsula with a much more sheltered landing place and base than Anzac Cove. The 13th Division, with some other detachments from Helles and with one brigade of the 10th Division, were the troops chosen to augment Birdwood's force already at Anzac. The new venture further north was entrusted to the 11th Division, which was to assemble in the island of Imbros supported by the rest of the 10th Division; the portions of this latter division not detailed for Anzac were to concentrate partly at Mudros, and partly in a port of Mitylene more than 100 m. from Suvla. The last divisions to arrive, the 53rd and 54th, were to be employed wherever should seem best after the offensive had begun. To land the whole of the reinforcements simultaneously would not have been practicable with the amount of water transport available.

The utmost secrecy was observed by the Allied staff. Appropriate steps were taken to mislead the Ottoman authorities by means of feints and of reconnaissances executed at localities other than those selected for operations. False reports were assiduously circulated by the intelligence department. This part of Hamilton's programme was, indeed, carried out most successfully, for, although Liman von Sanders was aware of the arrival of large bodies of British troops in the islands, he remained entirely ignorant of his rival's real design until this was actually in execution. The Ottoman commander had organized his forces as a southern group watching Helles and a northern group watching Anzac, with the already mentioned two divisions at the Bulair end of the peninsula. There were large Turkish forces in reserve about Chanak, in addition to substantial contingents disposed to the S. of the outlet of the Straits ready for any move of the Allies in that quarter; but, thanks to a system of jetties erected on either shore at the upper end of the Narrows, and to improved communications, troops could be shifted from side to side of the waterway very rapidly. Numerically, the contending armies would at this very critical juncture of the campaign be almost equal, the invaders rather the stronger; but the Turks were much dispersed, so that the result almost hinged upon the speed with which the attacking side should gain ground before the defenders had time to concentrate.



The offensive started on Aug. 6 with two preliminary enterprises. An onset was made upon some of the Turkish trenches in the Helles area, which led to sharp fighting; the object was to prevent the Turks transferring troops northwards, and it probably served its purpose; apart from that, little was accomplished although the affray went on intermittently for a week. Portions of the Australasian force also broke out of the southern sections of the Anzac position, and were rewarded by the acquisition of some very valuable ground after a violent contest; the real purpose, however, was to occupy the attention of the enemy and to conceal a design of much greater moment.

So dexterously had the assembling of the reinforcements within Birdwood's position been effected, that the Turks had entirely failed to detect how the numbers of their opponents in this area had during the last few nights been nearly doubled. The scheme of operations for the capture of the Sari Bair mountain mass was that the force detailed for this enterprise should move out in several columns from the northern end of the Anzac position along the low ground near the shore, after dark on the evening of the 6th On reaching their appointed stations the columns were to wheel to the right and were to work their way up certain steep but well-defined gullies that led towards the

fact afford to remain quiescent. The Allies, on the other hand, were practically compelled to remain quiescent. The general situation offered them no inducements to embark on fresh offensives. The great Aug. effort, which had been made when they were enjoying the advantages derived from concentration as opposed to dispersion, and when they were in the position to take the Turks unawares, had miscarried. It would have been folly after that experience to risk defeat and perhaps disaster in assailing formidable positions, effectively held and assiduously fortified. The Allies had in Aug. been rather superior in numbers to their opponents. But during the autumn Liman von Sanders was reinforced by several divisions, and at the juncture when Gen. Monro arrived and recommended evacuation of the peninsula, the Ottoman host gathered about the Dardanelles was already decidedly stronger in point of numbers than was the army which was clinging to patches of littoral without a sheltered base.

If there had been no fighting during these autumn months worthy of mention, much creditable work had been carried out by the invaders in respect to developing communications and to improving jetties and landing-places, especially at Suvla. One British and one French division were moved from the peninsula to Salonika early in Oct., but an additional Australian division had arrived a few weeks earlier. In spite of the discouraging conditions in which they found themselves, and of the constant annoyance suffered from hostile artillery fire, the troops were in fair heart, while the tactical efficiency of the recently created divisions, which had not been of a high standard when they arrived in the theatre of war, had appreciably progressed. The proportion of sick had been high during the summer-time, but it decreased somewhat after Sept. On the other hand a very severe blizzard, lasting two days, swept the whole region towards the end of Nov. and caused havoc amongst the divisions in the Suvla area, which was particularly exposed to the elements; this visitation augmented the numbers in hospital by several thousands. The tempestuous weather, moreover, created serious damage at most of the landing-places, where solidly constructed jetties were in some instances completely demolished by the seas. The Allied forces had been organized as three distinct groups. That at Helles (which included the French contingent, still as at the outset on the right) was under the charge of Gen. Davies. That at Anzac, composed mainly of troops from the Antipodes, remained under Gen. Birdwood. That at Suvla was commanded by Gen. Byng. But as Gen. Monro found himself responsible for the British troops at Salonika as well as for the Allied army of the Dardanelles, he placed the latter under charge of Gen. Birdwood, while Gen. Godley relieved Birdwood at Anzac.

Like their adversaries, the Turks had suffered much from disease during the summer. But as their numbers grew in the autumn, and as their headquarters staff noted how the invaders were dwindling away owing to transfers to Salonika and to no drafts arriving to replenish wastage, it became possible to keep a number of the Ottoman divisions in reserve, well in rear of the fighting fronts or else on the Asiatic side of the Dardanelles. This also permitted of the troops in the trenches being relieved and rested at frequent intervals. The defending side, in fact, came to be in a much more favourable position than was the attacking side in respect to diminishing the strain that is always experienced by fighting personnel when in close contact with an enemy even during periods of virtual inactivity. The Sultan's forces guarding the Straits were not yet at the end of Nov. deriving much benefit from the strategical transformation which had taken place in the Balkans consequent upon communications being opened between Thrace and the Central Powers; but there was every prospect of heavy artillery and munitions shortly beginning to find their way through from Germany and Austria-Hungary to the Dardanelles.

Foreseeing that the British Government must ultimately resign itself to a withdrawal of the Dardanelles army from its dangerous situation on the Gallipoli Peninsula, Monro had already, some days before the permission to evacuate reached him from home, given instructions that certain preparations were to be made towards facilitating that operation. That a retirement of this kind was a hazardous undertaking was realized from the outset. There was no precedent for large military forces, in close contact with a formidable enemy, embarking within easy artillery range of positions in the hands of the opposing side, and the most sanguine amongst high military authorities in the councils of the Entente feared that a withdrawal could not be carried out without incurring heavy losses. The responsible authorities on the spot perceived that the process of gradually removing the huge accumulations of impedimenta that were massed about the landing-places and of reëmbarking the troops must take place during the dark hours and step by step, every effort being made to keep the Turks unaware of what was in progress. Sickly men and some stores and animals had been got away before Dec. 8, which lightened the task in prospect. The tactical principle on which withdrawal would be carried out when the time came had been fully considered. The naval authorities had been busy assembling and organizing the available small craft in anticipation of the operation that appeared to be imminent, and jetties damaged in the Nov. gales were being repaired. It should be noted that the matter in hand was, from the point of view of water transport, somewhat facilitated by the British Government's determination to hold on to Helles for the present, as nearly all the lighters, boats, etc., in naval charge could consequently be gathered at Anzac and Suvla.

Birdwood decided, in consultation with Godley and Byng, that the front trenches should be held up to the very last moment on the night of final evacuation, the troops manning them then hastening to the beaches, everything removable, whether animate or inanimate, having already left. There was to be no taking up of successive positions in accordance with the normal practice of rearguard actions. At a given moment the trenches, which at many points were but a few yards from those occupied by the Turks, would be vacated by detachments, which by that hour would have shrunk to mere handfuls of men. Scarcely a shot had since the beginning of Dec. been fired after dark by the British, Australasian and Indian troops, who were holding the long line stretching from the Gulf of Saros to near Gaba Tepe, so as to accustom the foe to quietude during the night watches. The last parties of the Anzac force were to ship at Anzac Cove but for a detachment on the extreme left, which would embark with the Suvla troops. The Suvla area was divided into two sections, the troops in the right (or southern) section retiring S. of the lake and taking to the boats on the southern side of the bay, the other section retiring N. of the lake and embarking on its northern side. The final night was provisionally fixed as that of the 18th–19th, and thanks to favourable weather and to the efficiency of the arrangements, the very critical operation was carried out with triumphant success, just as had been laid down by programme ten days before.

Night after night during the intervening ten days the landing places at Anzac and Suvla were scenes of unceasing activity. Masses of war material and food supplies were in the first instance removed, then most of the animals were got away, lastly portions of the troops began to embark and to proceed to Imbros or Mudros. During the daytime reliefs took place as usual, pretences were made of disembarking animals and stores at the jetties, and the result was that the Turks remained in complete ignorance as to what was going on close to their lines. Large bodies of infantry with a fair proportion of guns still remained on shore on the 17th, but of these roughly half—about 10,000 men and a number of guns in each area—were removed that night, so that on the 18th only a meagre force, composed almost wholly of infantry and disposed almost entirely in the trenches, was holding a long front face to face with a numerically far stronger enemy. But, fortunately for the Allies, their dispositions had been so skilful that the Ottoman staff had not ascertained that the Anzac and Suvla areas had been almost vacated. The critical day passed without incident.

The hour fixed for finally quitting the front trenches in the Suvla area, and the adjacent northern portions of the Anzac area, was 1:15 A.M. on the 19th. Owing to their vicinity to the cove the rest of the Anzac trenches were, however, to be held till a

later hour. At nightfall the very few guns still to go were hurried off to the jetties. Then the troops along the front were quietly withdrawn in successive groups, the fine weather continuing to the end and work at the beaches proceeding without a hitch. Finally the parties still in the trenches slipped away, and when dawn broke the Turks, who had first ascertained that something unusual was afoot from the explosion of a vast mine in the Anzac area, and from conflagrations on the beaches where the few stores to be abandoned were being destroyed, discovered that the invaders were gone. Twenty-four hours later the long spell of calm, a godsend to Godley and Byng, came to an end.

Practically nothing worth mentioning had been left behind at Suvla. At Anzac, where conditions favoured the retreating troops less, it had been necessary to destroy some valuable war material at the last moment, and a few worn-out guns had purposely been abandoned. The casualties in the two areas on the final night had amounted to two. The relaxing by the Allies of their frail hold upon the outer coastline of the Gallipoli Peninsula had been effected more successfully than the most sanguine amongst them had permitted themselves to hope for. Yet, for a week subsequent to their receiving the glad tidings from the Aegean, the British Government remained irresolute with regard to the policy to be pursued at Helles. Then, on Dec. 28, Monro received the expected sanction for evacuating that area also, and Birdwood promptly grappled with this fresh problem.

Taken unawares and signally out-manœuvred at Anzac and Suvla, Liman von Sanders perceived that his antagonists would probably retire from Helles also, and he took measures accordingly. He had at this time 21 divisions at his disposal, while there were only four British divisions to oppose them at Helles (the last French division left for Salonika during Dec.). The Turks, therefore, now possessed a huge numerical preponderance in the theatre of war. They moreover enjoyed an even more marked superiority in respect to artillery, and this the Ottoman commander-in-chief hastened to turn to account; the heavier guns which had been sweeping the Anzac and Suvla areas for months past were promptly transferred to the high ground overlooking the extremity of the peninsula or to positions on the Asiatic side of the Straits from which the extremity of the peninsula could be effectively taken in flank.

The same principles as those which had been so successfully applied during the evacuation of the northern areas, were put in force at Helles. The work of removing stores, war material, animals and personnel was to be carried out on successive nights, the fighting force ashore was to be gradually reduced, the front line of trenches was to be held up till the very last—the final night being fixed provisionally for the 8th–9th—and the detachments vacating it were to hurry straight off to the beaches. So as to deceive the enemy, bombing and rifle fire were to be practised nightly up till 11:30 P.M., after which all activity was to cease. Two possible eventualities had especially to be feared—the sea might get up, or a heavy bombardment of the beaches might be instituted by the Turks while the final evacuation was in progress. As the staff fully foresaw, the enemy would exert greater vigilance than had been the case while the withdrawals had been in progress from the northern areas, these having given the Ottoman authorities warning of what was likely to happen. It ought also to be mentioned that there was a greater accumulation of impedimenta at Helles than there had been at either Anzac or Suvla, so that even if the weather were to remain favourable, it was certain that material of great value would have to be destroyed to prevent its falling into the enemy's hands.

Embarkation operations were carried on almost entirely at "V" and "W" beaches, at both of which there were provisional breakwaters in existence furnishing some shelter when there was an onshore breeze. The weather, as it turned out, was none too favourable on several of the preliminary nights, but, owing to its direction, the wind did not greatly retard the work of removal. The enemy's guns gave a good deal of trouble at the beaches, and caused many casualties. Although steps were taken to conceal what was in progress, the Turkish staff were aware that preparations for evacuation were in full vigour; but they could not foresee the date on which the final flitting would take place, nor could they make sure how far the number of combatants within the British lines had been reduced. With the object apparently of ascertaining the strength of their opponents, the Ottoman forces on the afternoon of Jan. 7 delivered a half-hearted attack upon the left of the British position, following on a violent bombardment; but the assailants were driven off with little difficulty. Nor would they seem to have discovered how weakly held the trenches were; for a considerable proportion of both infantry and artillery had been withdrawn by that date, as only two more nights remained according to the programme. That night the troops still left at Helles were reduced by one-third, and, on the next day breaking fine, it was decided to complete the operation on the following night as intended at the start.

The right half of the British were to withdraw by "V" beach and the left half by "W" beach, except that the final detachments on the extreme left, representing the 13th Division, were to be got off at Gully beach. A large number of guns had been retained ashore in view of the danger of a determined attack by the Turks on the 8th, when the lines were thinly held; it had been decided to abandon several of these, worn-out ordnance being earmarked for the purpose. The artillery still remaining to be embarked was for the most part got afloat during the early hours of darkness, and the infantry followed; but the wind soon began to rise ominously, blowing home from W. and S.W., and as the hours passed the situation at the beaches became disquieting. The last detachments to quit the trenches moved off simultaneously all along the front at 11:45 P.M., without the enemy noticing their departure, and they were embarked successfully at "V" and "W" beaches according to schedule in spite of the heavy seas. But the detachments designated for Gully beach could not all be got off at the exposed point, and those left over had to march on to "W" beach at the last moment and were not afloat till nearly 4 A.M., their embarkation being effected with great difficulty owing to the surf. Just before the last boats sheered off the masses of stores which it had been necessary to abandon were set on fire, and only from the glare set up by this conflagration were the Turks made aware that their opponents had evaded them yet again.

Although the evacuation of Helles without appreciable loss in personnel reflected great credit on the British staff and the troops concerned in it, as also on the Royal Navy, whose work at the beaches was carried out under great difficulties, the escape of the final remnants of the Dardanelles army from the Gallipoli Peninsula was facilitated by the negligence of the troops opposed to them. Had the Turks kept befitting guard on the night of the 8th–9th, aware as they were that their antagonists contemplated departure, they must have detected that the British trenches had been vacated. Effectual pursuit might not have been practicable; but the guns could have been turned on to the beaches, of which the range was exactly known, and embarkation, impeded as it was by the rough water, could hardly have been carried out without many casualties.

After a few days taken up in collecting the troops from Helles in their different divisions at Lemnos, what was left of the Dardanelles army was shipped to Egypt, whither most of the forces from Anzac and Suvla had already proceeded. The total loss of the Allies' military forces in the eight months' contest mounted up to 130,000 killed, wounded and missing.

Most authorities on the art of war agree that the collapse of the Entente in this memorable campaign was primarily due to the abortive naval effort to force the Dardanelles. By embarking on that venture the fleet gave the Turks sufficient warning of what was in store to ensure that, on the date on which Sir I. Hamilton's army was ready to land, the defenders should be in a position to bring it to a standstill. The only chance of the invaders achieving their object after the first week of land fighting depended on their being joined by very substantial additional forces in a region where a belligerent fighting on the defensive in home territory, as the Osmanlis were, enjoyed marked strategical and tactical advantages. But neither the British nor the French could afford to divert great military resources from the main theatre

of war in western Europe to the Aegean, and so the struggle for the Straits ended in mortifying discomfiture for the Allies.

(C. E. C.)

DARLING, SIR CHARLES JOHN (1840–), English judge, was born at Colchester Dec. 6 1840. He was educated privately, and in 1874 was called to the bar. He became a Q.C. in 1885, in 1888 successfully contested Deptford in the Conservative interest, and in 1892 became a bencher of the Inner Temple. He was raised to the bench and knighted in 1897. He has published some volumes of light verse, including *Scintillae Juris* (1877). In 1917 he was made a Privy Councillor.

DARTMOUTH COLLEGE, Hanover, N.H., U.S.A. (*see* 7.838), in the period between 1908 and 1921 experienced a great expansion in its plant, endowment and enrolment. Its educational plant in the latter year included 21 buildings devoted to lecture and recitation rooms, laboratories, and administration and similar purposes.

Of these, the extensive alumni gymnasium was erected in 1910, to which was added the Spaulding swimming pool in 1920; the Parkhurst administration building was erected in 1910; Robinson Hall, the home of all undergraduate organizations except athletic, in 1914; and a large chemical laboratory in 1920–1. The plant also included 18 dormitories, of which five were added after 1908, the latest in 1920, capable in all of housing 1,100 students. The value of the plant was over $2,000,000.

In addition to the educational plant the college had 20 single or apartment houses for the use of its faculty. Its productive investment assets nearly doubled in the 12-year period, approximating $5,500,000. In 1920–1 it had 150 officers of administration and instruction, and there were 1,875 enrolled students, of whom 54 were in post-graduate courses. The tuition fee was $250 a year. The constituency of the college, formerly mainly in New England, extended to the whole country. In 1910 62% of the freshmen came from New England. One of the effective influences leading to expansion was the Outing Club, the first college club of its kind, which was open to both faculty and students and had as its object the stimulation of healthful outdoor activities. It owned a chain of seven cabins, extending over 75 m. from Hanover to the White mountains and equipped for the accommodation of its members on their excursions into the country and among the mountains. Its winter activities culminated in a carnival of sports.

Like other American colleges, Dartmouth was greatly affected by the World War. Even before the entrance of the United States, many of its students had joined the Allied armies or served in the ambulance corps in France, and in Feb. 1916 a battalion of 218 men in two companies was formed for military drill. In March 1917, the great majority of the students was enrolled for military training, and in the following fall military training was required of the freshmen. After the United States entered the war, the college became practically a camp, for all able-bodied students between 18 and 21 years of age were inducted into the Students' Army Training Corps and trained under military regulations, and those under 18 were enrolled in the corps, although remaining under college authority. There were also vocational sections of about 550 men who came to the college from outside for instruction in carpentry, cement work, truck driving and repairing, and radio work. All military training came to an end in Dec. following the Armistice, and the college reverted to its former status. In consequence of the war the enrolment fell from more than 1,500 to 761, of whom only 110 were not under military training. Many members of the faculty engaged in war service in the United States or in France, either under the Government or in the organizations supplementary to the military. The total number of undergraduates (from the six classes 1917 to 1922) who entered the war or served in the S.A.T.C. was 1,817 and of the faculty 73. The total number of Dartmouth men, graduates, undergraduates, and faculty, who served in the army, navy or marine corps was 2,603, in the auxiliary service 752.

(E. M. Ho.)

DARWIN, SIR GEORGE HOWARD (1845–1912), English astronomer, was born at Down, Kent, July 9 1845. The second son of Charles Darwin (*see* 7.840), he was second wrangler and Smith's prizeman at Cambridge, and was elected to the professorship of astronomy and experimental philosophy at his university in 1883. His principal work was on the subject of tides, on which he became the leading authority, and on other physical questions connected with the relation of the earth and moon; the article Tide in the *E.B.* (*see* 26.938 *et seq.*) represented his matured researches on his special subject. He was made K.C.B. in 1905 and died at Cambridge Dec. 7 1912.

DATO, EDUARDO (1856–1921), Spanish politician, was born at Corunna Aug. 12 1856. He graduated in law at the university of Madrid and was elected a deputy in 1884. An under-secretary for the Home Department in 1892, he became minister for the department in 1899, and distinguished himself in the study of social legislation, the fruits of which were special bills regarding accidents, insurance, and women's labour. In Dec. 1902 he became Minister of Justice, in 1907 mayor of Madrid, then president of the Chamber. He was elected a member of the Royal Academy of Social and Moral Sciences, June 20 1905. When in 1913 Señor Maura refused to take power except on conditions unacceptable to the King, Señor Dato, thinking that the Conservative party could not refuse to serve the Crown at a difficult moment, dissented from his chief, carrying with him the majority of his party, which elected him as its leader. He was still in office (1913–5) when the World War broke out, and was responsible for Spain's declaration of neutrality. He adhered firmly to that policy. Becoming prime minister again in 1917, he faced the great crisis of that summer. In 1920 he resumed office, and it was while prime minister that he was murdered in Madrid March 8 1921. Señor Dato had great social charm, persuasive talent and an unswerving will under flexible appearances.

DAUDET, LÉON (1867–), French writer, son of Alphonse Daudet (*see* 7.848), was born in Paris Nov. 16 1867. He was educated at the lycée Louis le Grand, and afterwards studied medicine, a profession which he abandoned in 1894 for that of literature. He wrote many short stories and novels, and has also contributed to the *Figaro, Gaulois* and *Libre Parole.* He is an ardent royalist in politics, and was one of the group which in 1908 founded the royalist organ *L'Action Française.* He published in 1898 a Life of his father, and among his other works may be mentioned *Les Morticoles* (1894); *Les Deux Étreintes* (1901); *La Déchéance* (1904); *Les Primaires* (1906); *La Lutte* (1907) and *L'Avant Guerre* (1913). He produced various essays on the World War, and his latest novels include *La Vermine du Monde* (1916); *Le Bonheur d'être Riche* (1917); *Le Cœur et l'Absence* (1917) and *Dans la Lumière* (1919).

See R. Guillou, *Léon Daudet* (1918).

DAUMET, PIERRE JEROME HONORÉ (1826–1911), French architect, was born in Paris Oct. 23 1826. He entered the École des Beaux-Arts in 1845, and was awarded the Grand Prix de Rome in 1855. In 1861 he was attached to the important exploratory expedition and mission in Macedonia, and was commissioned to draw up the report. In the following year he was appointed inspector of works for the then recently created Préfecture of Police, and was later acting architect to the Palais de Justice, succeeding in 1876 Viollet-le-Duc as architect-in-chief. This fine building may be regarded as one of the great and lasting monuments of his career. During the next few years Daumet's talents and artistic equipment, especially in matters of archaeological interest and research, received recognition from the French Government in his appointment to many official positions, culminating in his vice-presidentship of the Commission des Monuments Historiques. His brother-artists distinguished him by electing him vice-president of the Société des Artistes Français, and president of the Société des Architectes Français. In 1885 he was elected a member of the Académie des Beaux-Arts, and in the following year an hon. corresponding member of the Royal Institute of British Architects, who further awarded him their gold medal in 1908. One of the highest expressions of his genius was his restoration of Chantilly in close collaboration with the Duc d'Aumale, who later (in 1897) bequeathed it to the French nation, as represented by the Institut de France. Among Daumet's many architectural works may be noted the following:— The Palais des Facultés and the Palais de Justice at Grenoble, the Ecce Homo chapel at Jerusalem, the pension and chapel of the Dames de Sion in Paris and Tunis, his early work at the Asile des Aliénés of Ste. Anne, and the Palais de Justice, Paris, already mentioned. His literary work, besides his important account of the archaeological mission to Macedonia, includes a book on the Château de St. Germain and its restoration for which he was responsible. His

services to the educational side of his art were considerable. His *atelier* produced no less than nine holders of the Grand Prix de Rome—a notable record. He died Dec. 13 1911.

DAVIDS, THOMAS WILLIAM RHYS (1843–), British orientalist, was born at Colchester May 12 1843. Educated at a school in Brighton and at Breslau University he entered the Ceylon civil service in 1866 and also read for the bar, becoming a barrister of the Middle Temple in 1877. He became a close student of Buddhism and of the literatures of India, and in 1882 was appointed professor of Pali and Buddhist literature at University College, London. In 1904 he became professor of comparative religion at the university of Manchester. Amongst his numerous publications are *Buddhism* (1878, 18th ed. 1899); *Ancient Coins and Measures of Ceylon* (1877); *Buddhist India* (1902); *Early Buddhism* (1908); and the articles on *Buddha, Buddhism, Pali, Lamaism*, etc. in the *E.B.* He became president of the Pali Text Society, which he founded in 1882, and a fellow of the British Academy. He married in 1894 Caroline Augusta Foley, herself the author of *Buddhist Psychology* (1900), *Psalms of the First Buddhist* (1910) and other works.

DAVIDSON, RANDALL THOMAS (1848–), Archbishop of Canterbury (*see* 7.863), in 1920 brought forward in the House of Lords a motion opposing Lord Birkenhead's Divorce bill, which was lost by one vote. The same year he presided over the sixth Lambeth conference.

DAVIES, HENRY WALFORD (1869–), English organist and composer, was born at Oswestry, Salop, Sept. 6 1869. After a preliminary private education he became a chorister at St. George's chapel, Windsor, in 1882, and three years later assistant organist to Sir Walter Parratt there. From 1890 to 1894 he was a pupil and scholar at the Royal College of Music, where in 1895 he became a teacher of counterpoint. There he came first into some prominence as composer with his cantata *Hervé Riel* (1894), but meanwhile he was making his way as organist. After filling several posts he was in 1898 appointed organist to the Temple church, a post he still holds (1921). During the years 1903 to 1907 he was conductor to the London Bach Choir in succession to Stanford, and in 1919 he was appointed professor of music in the University College of Wales, at Aberystwith. For a great part of the World War, with the rank of major, he worked with great success for the right organization of music among the troops both abroad and at home, and in 1918 he was made director of music to the R.A.F.

Walford Davies has written much music in many forms. In his list are two symphonies: *A Solemn Melody*, which attained to a wide popularity, and, for chorus and orchestra, *Everyman* (1904); *Ode on Time* (1908); *The Sayings of Jesus* (1911); *Dante Fantasy* (1914), these having been produced chiefly at provincial festivals; *Heaven's Gate* (People's Palace, 1917). A new choral work was in the programme of the Hereford festival for Sept. 1921. In addition there are seven quartets for various combinations of piano and strings, or strings alone; six violin sonatas and several works for voices and strings, part-songs, choruses, and hymn tunes.

DAVIES, HUBERT HENRY (1876–1917), English playwright, was born in Cheshire March 17 1876. After some years of journalism in San Francisco, where he also produced a few vaudevilles, he returned to England and made a success at the Haymarket theatre in 1903 with *Cousin Kate* and a greater success at Wyndham's theatre with *Mrs. Gorringe's Necklace*. Among his other comedies were *The Mollusc* (1907), and *Doormats* (1912). He produced *The Outcast* (1914). After overworking himself in France as a hospital orderly during the earlier portion of the World War, he had a break-down in health, and he was found dead at Robin Hood's Bay, Yorks., Aug. 17 1917.

DAVIES, JOHN LLEWELYN (1826–1916), English divine and educationalist, was born at Chichester Feb. 26 1826. He was educated at Repton and Trinity College, Cambridge, where he was bracketed as fifth classic in 1848, and was elected to a fellowship at Trinity in 1851. He was ordained in 1850 and held successively several London livings. He was made chaplain to the Queen in 1876, and in 1889 became vicar of Kirkby Lonsdale, Westmoreland, where he remained till 1908. Davies was an intimate friend of John Frederick Denison Maurice (*see* 17.910), and was associated with him in the foundation of the Working Men's College (1854), where he taught for many years. He was elected to the first London school board in succession to Huxley, and in 1873 became principal of Queen's College, Harley St., which had been founded by Maurice in 1848 for the advancement of women's education. He held this post until 1874, and was again principal from 1878 to 1886. Davies died at Hampstead May 17 1916. He was part author of Davies and Vaughan's well-known translation of Plato's *Republic*.

DAVIES, SARAH EMILY (1830–1921), British educationalist, was born at Southampton April 22 1830. She was educated at home, and later identified herself with the movement for the higher education of women, being also one of a group of women who about 1858 were discussing the question of women's suffrage at the Kensington Society. In 1862 she became secretary to the committee which was formed for the purpose of procuring the admission of women to university examinations, and from 1870 to 1873 was a member of the London school board. In 1873 she was elected a life governor of University College, London, and in 1882 became secretary of Girton College, Cambridge, retiring in 1904. She published *The Higher Education of Women* (1866) and *Thoughts on some Questions relating to Women* (1860–1908, 1910). She died in London July 13 1921.

DAVIES, WILLIAM HENRY (1870–), British poet, was born at Newport, Monm., April 20 1870. He was apprenticed to a picture-frame maker, but when his apprentice days were over he tramped through America, crossed the Atlantic many times on cattle boats, became a pedlar and street singer in England, and after eight years of this life published his first volume of poems, *The Soul's Destroyer*, from the Marshalsea prison. Next year appeared in prose *The Autobiography of a Super-Tramp* (1908) with a preface by G. Bernard Shaw, as well as *Nature Poems and Others*. A collected edition of his poems appeared in 1916, and *Forty New Poems* in 1918. He also published a novel, *A Weak Woman* (1911), and volumes of nature studies and essays, including *A Poet's Pilgrimage* (1918).

DAVIS, HENRY WILLIAM BANKS (1833–1914), English painter (*see* 7.866), died at Glaslyn, Radnorshire, Dec. 1 1914.

DAVIS, RICHARD HARDING (1864–1916), American writer, was born in Philadelphia April 18 1864. He studied at Lehigh University and Johns Hopkins, and in 1886 became a reporter on the *Philadelphia Record*. After working on several papers he served as managing editor of *Harper's Weekly*. He became widely known as a war correspondent, reporting every war from the Greco-Turkish War (1897) to the World War. Of his numerous works of fiction, the earliest are his best, especially *Gallegher and Others* (1891); *Van Bibber and Other Stories* (1892) and *Episodes from Van Bibber's Life* (1899). His other books include: *Soldiers of Fortune* (1897); *Captain Macklin* (1902); *Vera the Medium* (1908); *The Bar Sinister* (1904) and *With the French in France and at Salonika* (1916). His plays include *Miss Civilization; The Dictator; The Galloper; The Orator of Zapata City* and *The Zone Police*. He died near Mt. Kisco, N.Y., April 11 1916.

DAVISON, HENRY POMEROY (1867–), American banker, was born at Troy, Pa., June 13 1867. He was educated at Greylock Institute, South Williamstown, Mass. He was successively errand-boy in the bank conducted by his uncle in Troy, Pa., runner for a Bridgeport (Conn.) bank and paying-teller in the newly opened Astor Place Bank in New York City, remaining there from 1891 to 1894. From 1894 to 1902 he was connected with the Liberty National Bank, New York, successively as assistant-cashier, vice-president and president. In 1902 he became vice-president of the First National Bank, and in 1907, following his activities during the panic of that year, he entered the firm of J. P. Morgan & Co., of which he was in 1921 still a member. In 1908 he was appointed adviser to the National Monetary Commission to investigate the financial systems of Europe. Later he served at the head of a group of American bankers interested in the Six Power Chinese Loan. From 1917

of war in western Europe to the Aegean, and so the struggle for the Straits ended in mortifying discomfiture for the Allies.

(C. E. C.)

DARLING, SIR CHARLES JOHN (1840–), English judge, was born at Colchester Dec. 6 1840. He was educated privately, and in 1874 was called to the bar. He became a Q.C. in 1885, in 1888 successfully contested Deptford in the Conservative interest, and in 1892 became a bencher of the Inner Temple. He was raised to the bench and knighted in 1897. He has published some volumes of light verse, including *Scintillae Juris* (1877). In 1917 he was made a Privy Councillor.

DARTMOUTH COLLEGE, Hanover, N.H., U.S.A. (*see* 7.838), in the period between 1908 and 1921 experienced a great expansion in its plant, endowment and enrolment. Its educational plant in the latter year included 21 buildings devoted to lecture and recitation rooms, laboratories, and administration and similar purposes.

Of these, the extensive alumni gymnasium was erected in 1910, to which was added the Spaulding swimming pool in 1920; the Parkhurst administration building was erected in 1910; Robinson Hall, the home of all undergraduate organizations except athletic, in 1914; and a large chemical laboratory in 1920–1. The plant also included 18 dormitories, of which five were added after 1908, the latest in 1920, capable in all of housing 1,100 students. The value of the plant was over $2,000,000.

In addition to the educational plant the college had 20 single or apartment houses for the use of its faculty. Its productive investment assets nearly doubled in the 12-year period, approximating $5,500,000. In 1920–1 it had 150 officers of administration and instruction, and there were 1,875 enrolled students, of whom 54 were in post-graduate courses. The tuition fee was $250 a year. The constituency of the college, formerly mainly in New England, extended to the whole country. In 1910 62% of the freshmen came from New England. One of the effective influences leading to expansion was the Outing Club, the first college club of its kind, which was open to both faculty and students and had as its object the stimulation of healthful outdoor activities. It owned a chain of seven cabins, extending over 75 m. from Hanover to the White mountains and equipped for the accommodation of its members on their excursions into the country and among the mountains. Its winter activities culminated in a carnival of sports.

Like other American colleges, Dartmouth was greatly affected by the World War. Even before the entrance of the United States, many of its students had joined the Allied armies or served in the ambulance corps in France, and in Feb. 1916 a battalion of 218 men in two companies was formed for military drill. In March 1917, the great majority of the students was enrolled for military training, and in the following fall military training was required of the freshmen. After the United States entered the war, the college became practically a camp, for all able-bodied students between 18 and 21 years of age were inducted into the Students' Army Training Corps and trained under military regulations, and those under 18 were enrolled in the corps, although remaining under college authority. There were also vocational sections of about 550 men who came to the college from outside for instruction in carpentry, cement work, truck driving and repairing, and radio work. All military training came to an end in Dec. following the Armistice, and the college reverted to its former status. In consequence of the war the enrolment fell from more than 1,500 to 761, of whom only 110 were not under military training. Many members of the faculty engaged in war service in the United States or in France, either under the Government or in the organizations supplementary to the military. The total number of undergraduates (from the six classes 1917 to 1922) who entered the war or served in the S.A.T.C. was 1,817 and of the faculty 73. The total number of Dartmouth men, graduates, undergraduates, and faculty, who served in the army, navy or marine corps was 2,603, in the auxiliary service 752.

(E. M. Ho.)

DARWIN, SIR GEORGE HOWARD (1845–1912), English astronomer, was born at Down, Kent, July 9 1845. The second son of Charles Darwin (*see* 7.840), he was second wrangler and Smith's prizeman at Cambridge, and was elected to the professorship of astronomy and experimental philosophy at his university in 1883. His principal work was on the subject of tides, on which he became the leading authority, and on other physical questions connected with the relation of the earth and moon; the article Tide in the *E.B.* (*see* 26.938 *et seq.*) represented his matured researches on his special subject. He was made K.C.B. in 1905 and died at Cambridge Dec. 7 1912.

DATO, EDUARDO (1856–1921), Spanish politician, was born at Corunna Aug. 12 1856. He graduated in law at the university of Madrid and was elected a deputy in 1884. An under-secretary for the Home Department in 1892, he became minister for the department in 1899, and distinguished himself in the study of social legislation, the fruits of which were special bills regarding accidents, insurance, and women's labour. In Dec. 1902 he became Minister of Justice, in 1907 mayor of Madrid, then president of the Chamber. He was elected a member of the Royal Academy of Social and Moral Sciences, June 20 1905. When in 1913 Señor Maura refused to take power except on conditions unacceptable to the King, Señor Dato, thinking that the Conservative party could not refuse to serve the Crown at a difficult moment, dissented from his chief, carrying with him the majority of his party, which elected him as its leader. He was still in office (1913–5) when the World War broke out, and was responsible for Spain's declaration of neutrality. He adhered firmly to that policy. Becoming prime minister again in 1917, he faced the great crisis of that summer. In 1920 he resumed office, and it was while prime minister that he was murdered in Madrid March 8 1921. Señor Dato had great social charm, persuasive talent and an unswerving will under flexible appearances.

DAUDET, LÉON (1867–), French writer, son of Alphonse Daudet (*see* 7.848), was born in Paris Nov. 16 1867. He was educated at the lycée Louis le Grand, and afterwards studied medicine, a profession which he abandoned in 1894 for that of literature. He wrote many short stories and novels, and has also contributed to the *Figaro, Gaulois* and *Libre Parole.* He is an ardent royalist in politics, and was one of the group which in 1908 founded the royalist organ *L'Action Française.* He published in 1898 a Life of his father, and among his other works may be mentioned *Les Morticoles* (1894); *Les Deux Étreintes* (1901); *La Déchéance* (1904); *Les Primaires* (1906); *La Lutte* (1907) and *L'Avant Guerre* (1913). He produced various essays on the World War, and his latest novels include *La Vermine du Monde* (1916); *Le Bonheur d'être Riche* (1917); *Le Cœur et l'Absence* (1917) and *Dans la Lumière* (1919).

See R. Guillou, *Léon Daudet* (1918).

DAUMET, PIERRE JEROME HONORÉ (1826–1911), French architect, was born in Paris Oct. 23 1826. He entered the École des Beaux-Arts in 1845, and was awarded the Grand Prix de Rome in 1855. In 1861 he was attached to the important exploratory expedition and mission in Macedonia, and was commissioned to draw up the report. In the following year he was appointed inspector of works for the then recently created Préfecture of Police, and was later acting architect to the Palais de Justice, succeeding in 1876 Viollet-le-Duc as architect-in-chief. This fine building may be regarded as one of the great and lasting monuments of his career. During the next few years Daumet's talents and artistic equipment, especially in matters of archaeological interest and research, received recognition from the French Government in his appointment to many official positions, culminating in his vice-presidentship of the Commission des Monuments Historiques. His brother-artists distinguished him by electing him vice-president of the Société des Artistes Français, and president of the Société des Architectes Français. In 1885 he was elected a member of the Académie des Beaux-Arts, and in the following year an hon. corresponding member of the Royal Institute of British Architects, who further awarded him their gold medal in 1908. One of the highest expressions of his genius was his restoration of Chantilly in close collaboration with the Duc d'Aumale, who later (in 1897) bequeathed it to the French nation, as represented by the Institut de France. Among Daumet's many architectural works may be noted the following:— The Palais des Facultés and the Palais de Justice at Grenoble, the Ecce Homo chapel at Jerusalem, the pension and chapel of the Dames de Sion in Paris and Tunis, his early work at the Asile des Aliénés of Ste. Anne, and the Palais de Justice, Paris, already mentioned. His literary work, besides his important account of the archaeological mission to Macedonia, includes a book on the Château de St. Germain and its restoration for which he was responsible. His

complete. In 1881:—"We feel bound to point out how very incomplete are the returns which relate to these afflictions. We have done our best with these unsatisfactory data," etc. In 1891 the report characterized the statistics as "in all probability excessively inaccurate." In 1901 it was pointed out that the machinery of an ordinary census was but imperfectly adapted to furnish the required particulars with the degree of accuracy which is essential for statistical purposes; and in 1911 the report stated:—"We must submit that statistics of this nature obtained through a general population census are most unsatisfactory, firstly on account of the difficulty of framing a suitable form of inquiry defining the degree of disability, and secondly because the definition has to be applied by householders with no technical knowledge, who will interpret it in different ways, and many of whom have a natural reluctance to admit that they or their relatives suffer from any defect." But the choice of wording in the 1911 census schedule was particularly unfortunate and confusing, and might have been avoided if the department had been willing to ask or accept the advice of those bodies, such as the National College of Teachers of the Deaf, and the National Bureau for Promoting the General Welfare of the Deaf, which, for educational and social reasons, were anxious to secure reliable statistics relating to deafness and deaf-mutism in the United Kingdom. "Total deafness" is comparatively rare, whether it is congenital or acquired, and even among the so-called "deaf and dumb" it is generally recognized that there are from 15 to 25% with a useful amount of hearing. This fact and the unwillingness mentioned by the commissioners to the return of children who have fairly successfully been taught speech as "dumb" presented difficulties which even experts, such as the responsible heads of institutions for the deaf, found it hard to overcome in any attempt to give accurate returns. For instance, if the 100 children in a school for the deaf were in the majority of cases neither "totally deaf" nor "deaf and dumb" (*i.e.* orally taught), what was the headmaster to do? Leave them out?—or insert them?—and, if the latter, where? Mr. B. St. Johns Ackers, the chairman of the statistics committee of the National College of Teachers of the Deaf, in his address before the Manchester Conference in 1911, laid down a broad principle—"statistics, to have their full value, should not only be accurate, full and reliable, but should be on the same plan in all countries. This should apply to census and school statistics," and as the fuller consideration of all forms of defect, not only as to treatment but also as to preventive measures, is now occupying the attention of the newly formed Ministry of Health, it is essential, if State funds are to be spent in collecting information, that such information should be of real value when obtained.

The difficulty of framing a suitable question or questions relating to so wide a subject as deafness and deaf-mutism, in a short and simple form, in the small space available on a census schedule, caused the department to omit any attempt to secure information of this kind from the 1921 census, and further statistics of this kind will not in future be available until some new machinery has been provided. This may be undertaken through the Ministry of Health, or, if undertaken with the assistance of the various educational and social organizations connected with the deaf and dumb, might secure figures not only relative to the actual existence, but also as to the causes of deafness, which might later prove of inestimable value in preventive measures, and so greatly reduce the number of this afflicted class in the community.

Indeed the medical inspection of school children has already begun to operate in this direction and the discovery of children suffering from causes which may lead to partial or total deafness is part of the ordinary routine of the school medical officers in the counties and county boroughs of the United Kingdom. In 1919 Dr. Hamar, chief medical officer to the London County Council, reported that at the school medical inspections 4,211 children (2·2%) were found to have ear disease, of whom 2,823 (1·4%) were referred for treatment, and the London County Council has now established six centres for the educating of children suffering from impairment of hearing short of "deafness" within the meaning of the 1893 Act. About 25% of the children attending these centres suffer from discharging ears and receive nursing attention under medical supervision.

In this connexion it is interesting to note that in a comparison of the conditions in 1915 and 1919 it was found that in the former year 2·1% of the children examined in London were found to be suffering from ear disease, whilst in the latter year there were only 1·85%. At Glasgow it was found that out of 500 cases of deafness and middle-ear disease, 26% originated in measles, 12% in scarlet fever, 29% in simple catarrh and 20% during dentition. Mr. Yearsley, the aurist of the London County Council, found that of 177 cases certified by him to be deaf or hard-of-hearing, 37 were congenital, in 119 cases it was acquired, and in 21 doubtful. Of the cases of acquired deafness, 61 resulted from suppurative and middle-ear disease, 18 followed infectious fevers, 11 resulted from congenital syphilis and 20 followed meningitis. In the report of Dr. Butterworth (Lancs.) the general conclusions arrived at were that "deafness in school children is largely due to causes which can be removed by simple treatment, but this treatment can only be satisfactorily carried out in a clinic, where the child can attend regularly till it is cured"; and a further suggestion was made that "the ear, like the eye, must be brought under systematic supervision from infancy upwards."

In the report of the chief medical officer of the Board of Education for 1919 the position with regard to the schools was given as follows:—

	No. of schools		Provided	Voluntary	Accommodation	No. on registers
	England	Wales				
Deaf .	49	2	37	14	4,622	3,893

In Scotland the latest figures available give 12 schools with accommodation for 1,014 children and 714 pupils in attendance; in Ireland 4 schools with accommodation for 580 children and 525 pupils. There was still no law for the compulsory education of the deaf of Ireland.

In the same report for 1919 the chief medical officer of the Board of Education made the following statement:—"The regulations of the board cover the educational needs of the child from the age of two years upwards, extending to the age of sixteen. From the age of two to the age of seven attendance is optional and only becomes compulsory at seven. The disadvantages of this statutory provision are considerable, and authorities are not as a rule willing to incur the heavy expense of special education so long as the law does not compel them to do so, and the deaf child is involved in a serious educational loss in consequence. The early beginnings of speech which come more easily to the deaf child are withheld from him to a later age and it may safely be said that the majority of the deaf children never make up for the loss sustained by postponing the beginning of education until seven, or, as often happens, till later."

This illiberal policy of depriving the deaf of the early years of instruction occasionally takes a more aggravated form when parents or local authorities, from reasons of economy, allow the children to remain away from school even after the statutory age of seven. In a return in 1920 it was found that among the children admitted to schools for the deaf 109 were eight years of age or older, 47 over 8; over 9, 28; over 10, 13; over 11, 10; over 12, 7; over 13, 3; over 14, 1. To remedy this evasion of the law a resolution was adopted at the Conference of Teachers of the Deaf at Birmingham in 1920 asking that in cases in which the pupil was admitted later than the legal age the school period should be extended to secure to the child the full period of instruction. This would be in conformity with the practice in America, where many states provide a school period of from 10 to 12 years for their deaf pupils, irrespective of the age of entry.

The average attendance in England and Wales in the last school year (according to the report for 1919) was 3,325—2,355 in institutions and 970 in day schools. In 1920 Mr. Story, chairman of the National College of Teachers for the Deaf, stated that of 2,761 children attending 32 of the schools, 170 were semi-mute (*i.e.* had become deaf after having acquired normal speech), 390 were partial-hearing cases, 80 were mentally defective as well as deaf, 7 were blind and deaf, whilst 2,114 were ordinary cases of deaf-mutism. Referring to the methods of instruction, he gave the following statement relating to the year ended March 31 1920:—"The oral method largely predominates in our schools. The day schools are practically entirely oral, as are also several of the residential schools. In the cases of 2,816 children attending 34 schools, 2,494 are orally taught, 289 by finger spelling and 33 by finger and speech combined."

For the same period the returns of American schools, as published by the *American Annals*, showed that in 169 schools in the United States there were 13,779 pupils, of whom 10,376 were taught wholly or chiefly by the oral method, and a further 862 taught speech in combination with some other method—finger-spelling or "signing."

These figures prove the great advance which has been made in the attempt to remove the abnormality of the deaf. The deaf child of tender years is just like his brother or sister, except for his deafness, but as years pass with no auditory impressions and no development of speech, and the only means of communication open to him that of gesture, his intercourse is narrowed down to those immediately around him, and the divergence from the normal **becomes**

more and more marked unless special means are used to combat it. The possession of a verbal language in place of a language of gesture, particularly if that language is used in the form of articulate speech, even though artificially taught, and the ability to lip-read and the habit of looking to the face of the speaker for what is being said—all tend to lessen the abnormality induced by their affliction and to render the deaf more capable of taking their part in the workshop and the environment of their home in later life, than a specialized form of instruction such as finger-spelling or signing, known only to those expert in that means of communication.

The general recognition of this fact has led during the past half-century to an almost complete change from silent to oral methods in the majority of schools, both in Europe and America, though there were still in 1921 a few schools on both sides of the water where silent methods were adhered to, or where they formed the basis of ordinary means of intercourse, so that the oral work of the teachers was considerably nullified by the daily usage. A proportion, too, of deaf children in the schools is incapable of acquiring speech and a verbal language of sufficient range to be of practical use, either on account of poor intelligence, poor sight, lack of interest or general incapacity, whilst in some cases this incapability is induced by the lateness above mentioned at which the children begin their education, so that it is impossible to overcome the "signing" habit and to substitute for it an intricate verbal language. This has led to a demand for a classification of the pupils of the schools for the deaf in order to secure for them that form of the education for which they are mentally and physically best fitted.

The discussion of the Danish system of classification of schools for the deaf at the international conference in Edinburgh in 1907 gave an impetus to this question in England, and after careful consideration of the question by teachers in London, and at the general conferences, it has now become an accepted principle that, in order to secure an advance in the success of the oral methods, and to give each child the best educational opportunity of which it is capable, the varying types of deaf children should be segregated into separate schools and institutions and only one method employed in any one school. A similar conclusion has been reached in American schools. At the meeting in 1920 of superintendents and principals of American schools for the deaf, Principal Jones, the head of one of the largest "combined" schools in the States, made the following statement:—

"If I interpret the sentiment of the profession, and those interested in the deaf, correctly, it is that speech and speech-reading cannot be developed to the fullest extent of which they are capable in a congregated combined school. In a combined school there is always that lack of practice which makes it usable and effective. This, therefore, reduces to the lowest value all the efforts of the school and its hardworking teachers. The only remedy that I can see, after many years of laborious struggle to overcome it, is to separate the orally and manually taught children for as many years of their school life as is necessary to fix the speech habit."

Steps in this direction have been taken by the segregation of all backward and mentally and physically defective deaf children from the L.C.C. schools for the deaf to the residential school at Homerton (London), which in 1921 was about to be removed to new premises at Penn, Bucks., and by the establishment of Clyne House for the backward deaf at Manchester. At Homerton the combination of other defects, such as total or partial blindness, with deafness presents unique conditions for the study of psychological problems in conjunction with physiological abnormalities. The gradual removal of all younger pupils from the big institutions for the deaf has also been in operation, and the extension of the British Government regulations allowing children to be received from the age of "two" upwards will no doubt give an impetus to the establishment of infant and nursery schools for the deaf, where those "early beginnings of speech which come more easily to the young child" may have full play.

Provision of this kind had already, by 1921, been made at the Manchester, Doncaster and Margate institutions, at the Fitzroy Square (London), Moseley Road, Birmingham, and several L.C.C. day schools, to receive these younger children. The removal of partial-hearing and hard-of-hearing cases from the schools was also extended, and increased accommodation was being made for their special treatment, usually in connexion with one of the ordinary elementary schools. Classes have been established in Glasgow, Bristol, London and elsewhere, so that these children might not need to be brought into contact with the ordinary deaf-mute child. In these schools some amount of acoustic training is given, either by means of appliances or by the human voice alone, and the child is taught to supplement his partial hearing by "speech-reading," so that any hiatus caused by his lack of hearing may be overcome by his recognition of the spoken word on the lips. The children attend the ordinary school classes for such subjects as drawing, singing, etc., in which their partial deafness does not prevent their receiving the benefit of the instruction, whilst their association with the normal type of child prevents the growth of idiosyncrasies which might tend to increase their abnormality.

By a modification of the terms of Government regulations the State has now become responsible for 50% of the cost of the education of deaf children incurred by local authorities, and the remainder usually falls on the local rates, parents contributing towards the cost of "maintenance" of the children (as apart from education, such sums as may be assessed by the local authorities, or, in the case of dispute, as may be fixed by magistrate's order. Thus the last vestige of the need of charity for the education of the deaf has been removed.

The Board of Education in England extended its regulations in 1920 to allow for the payment of grants for the training of young persons beyond the age of 16 in preparation for a trade who had previously been taught in a special school for the blind or deaf. This would enable certain advanced courses of instruction in technical knowledge to receive grants, which had hitherto been entirely supported by private means—such as the J. E. Jones Trade School for the Deaf at Manchester. No attempt had yet been made to establish a school for the higher education of the deaf, though the matter had been repeatedly endorsed as a desirable end to the educational effort for this class in Great Britain.

The organization of a course of training at the university of Manchester for teachers of the deaf was rendered possible by the generous benefaction of Sir James E. Jones, who endowed the Ellis Llwyd Jones lectureship in the teaching of the deaf and founded the Ellis Llwyd Jones Hostel as a hall of residence for women students. Thus for the first time in the history of the education of the deaf the work became part of the work of an ordinary university. Bursarships have been established by various schools for the deaf and education authorities, to enable students to take advantage of the training thus provided.

A liberal grant has been made by the Carnegie trustees to the university to establish a library of deaf education, and this is housed in a room in the Christie Library at the university, where the books can be consulted by students and others interested in the question on application to the library authorities.

The establishment in London in 1911 of the National Bureau for Promoting the General Welfare of the Deaf was a step of the greatest importance. The famous "Volta Bureau," established in Washington, D.C., by Dr. Graham Bell, with the money he received from the "Volta" prize for the invention of the telephone, is well known, and it is confidently expected that this National Bureau, founded through the generosity of Mr. Leo Bonn, will do for Great Britain even more than its American predecessor. Full particulars of the 60 schools and institutions for the deaf, the 60 or 70 missions to the adult deaf, and the 15 or 16 large organizations, all interested in the advancement of the deaf in various ways, have been filed at the bureau, and the council consists of representatives of every organization working on behalf of this afflicted class, both in child and adult life. The main objects of the bureau are: 1 (centralization), to get into touch with and promote coöperation between all existing agencies; 2 (information), to collect, classify, and disseminate information; 3 (investigation), to promote investigation. Statistics and particulars relating to every existing agency and institution working for the deaf in the United Kingdom have been collected and published by the bureau in a useful form, and these will be kept up to date as changes occur. When public bodies and private individuals realize that complete and accurate information on all matters connected with the deaf may be obtained through the bureau, it will become a "clearing-house" for this branch of effort.

Unfortunately, the outbreak of the World War occurred just as this bureau was becoming recognized as a valuable asset, and owing to the depreciation of its resources it had not been able by 1921 to resume the activities it was so ably carrying on in its early years. Under the auspices of the bureau, Dr. J. Kerr Love gave a series of lectures in London on "The Causes and Prevention of Deafness." These lectures have been published, and contain some definite suggestions for the prevention of deafness both congenital and acquired by the notification and treatment of certain diseases as well as a full inquiry into the causes of hereditary deafness in Britain and America.

During the war special work for the deaf met with the same difficulties in Great Britain as beset every other branch of social effort. As a class the deaf were unable to take active part in military service, though here and there a few individuals managed to pass the medical tests and joined the Forces. Several attempts were made by bodies of deaf men in London, Liverpool and elsewhere to form volunteer units for service in some non-combatant capacity, but it was found impossible to secure recognition, probably owing to the great pressure with which the organizing officers of the army were working, and the matter languished for want of support. The fact that a number of deaf men went out with private firms and did useful work with hut building, etc., showed that there might have been useful units organized for this type of service if there had been time and inclination on the part of the officers to get them established. The great demand for labour of all kinds during the war brought about an unprecedented demand for the labour of the deaf members of the community in civil life, and for several years there was a greater appreciation of their economic value than had ever been accorded before. Unfortunately, with the general trade depression following the war there ensued a corresponding amount of unemployment, in which the deaf suffered in the same way as the hearing. The religious and social organizations working in behalf of the deaf also felt the lack of support which was being experienced by all charitable organizations up to 1921. With the exception of

one official in the capacity of work-seeker appointed by the Board of Trade, no State aid had been given to the deaf, but it was intended to apply for the inclusion of the deaf in the State provision which was set up for the training and employment of the blind.

As a result of the war a large number of wounded and disabled British soldiers and sailors were found to be suffering from deafness and from shell-shock, frequently accompanied by dumbness. In dealing with these men the experience of the schools for the deaf proved most valuable, and their organization and the services of their staffs were drawn on to teach lip-reading to the deafened men and to aid in the recovery of speech among those suffering from dumbness. The ordinary training in the methods of teaching articulation and speech-reading to deaf children was an excellent foundation on to which could be moulded the special requirements of the disabled men. Sir James Dundas Grant, at the head of a special aural board, was in charge of this department of the Ministry of Pensions, and had local expert and medical representatives in all parts of the country. Sir Frederick Milner and Mr. A. J. Wilson were instrumental in establishing hostels for deafened soldiers to provide social clubs for the men whilst undergoing special treatment and training in speech and lip-reading. The necessity for much of this special organization had largely ceased by 1921, but the lip-reading classes were still being carried on in various parts of the country under the direction of the ministry.

The convocations of Canterbury and York in 1918 adopted resolutions recommending that the spiritual welfare of the deaf and dumb should become a definite part of the work of each diocese and should be supported from diocesan funds, but up to 1921 this had not taken general effect. Five ordained clergymen were in 1921 at work among the deaf of London and district and three in other parts of Great Britain, whilst in the various populous centres of the British Isles "missions" to the deaf and dumb are carried on by lay-readers and other workers. (F. G. B.)

DEAKIN, ALFRED (1856–1910), Australian statesman, was born at Melbourne Aug. 3 1856, the son of a coach proprietor. He was educated at the university of Melbourne and was called to the Victorian bar in 1877; but before that date he had already worked as a journalist, and he continued to contribute frequently to the press, especially to the *Melbourne Age*. He entered the Victorian Legislature in 1878 and first took office as Minister of Public Works and Water Supply (1883–6). In 1885 he became Solicitor-General and in 1887 he was senior representative for his Colony at the first Imperial Conference held in London on the occasion of Queen Victoria's Jubilee. He was a member of all the bodies formed to promote the Federation of Australia as well as of the delegation which proceeded to London with the Australian Commonwealth bill in 1900 and, as Attorney-General, he was included in Sir Edmund Barton's first Federal "Cabinet of the Captains" (1901–3), succeeding him as Premier of Australia. During his legislative career in Victoria he was active in promoting social legislation and an ardent advocate of preference in favour of Great Britain. This fiscal policy he pursued during his three Federal premierships (1903–4, 1905–8, 1909–10), and he was also a strong supporter of Australia's coöperation in Imperial defence, being responsible for the acceptance of the measure authorizing Australian naval construction in 1909 and for the invitation to Lord Kitchener to come to Australia to report on the question of defence. He also passed that year an Act enforcing military training upon all able-bodied citizens. He was the leading figure at the Imperial Conference in London of 1907. After 1910 he led the Opposition in the Australian Parliament until ill-health compelled his retirement in 1913. He always refused any titular distinction; but he was credited by many with being the most brilliant orator of the British Empire, and the enthusiasm which he evoked in London was great. He represented "Centre" thought in Australian politics and for a long time was a reconciling influence between the Conservatives and the Labour party. He died Oct. 7 1919.

DEANE, SIR HENRY BARGRAVE FINNELLEY (1846–1919), English judge, was born April 28 1846, the only son of the Rt. Hon. Sir James Parker Deane, K.C. He was educated at Winchester and Balliol College, Oxford, where in 1870 he won the international law essay prize. He was called to the bar in 1870, and was made a Q.C. in 1896. From 1885 to 1905 he was recorder of Margate, and in 1905 was raised to the bench and knighted. From 1892 onwards his work lay mainly in the Probate, Divorce and Admiralty division. In 1917 he retired from the bench, and he died in London April 21 1919.

DE BROQUEVILLE, CHARLES, Comte (1860–), Belgian statesman, was born at Tostel, Belgium, Dec. 4 1860 of a family which was French in origin. He was privately educated and passed much time at his father's estate. It was his marriage to Mdlle. d'Huart, granddaughter of Jules Malou (*see* 17.406) the Conservative leader, that paved the way for his entrance into public life. At the age of 25 he became a member of the provincial council of Antwerp, subsequently being elected deputy for Tournhout, and in Aug. 1910 was appointed Minister of Railways, Posts and Telegraphs in the Schollaert Cabinet. On the fall of this Ministry (July 1912) Baron de Broqueville undertook the formation of a new Cabinet, and in Nov. 1912 also became Minister of War, in this position successfully pressing through the bill for strengthening the Belgian army. When in Aug. 1914 the Belgians determined to resist the passage of the Germans through their country, the Belgian premier well expressed the feelings of the nation in his declaration "Nous serons peut-être vaincus, mais soumis, jamais!" On the retreat of the Belgian army towards the Yser, De Broqueville established himself at Dunkirk and there assisted the military authorities to re-create the units of the Belgian army which had been broken in the retreat. He established the Belgian base at Calais, and after the battle of the Yser worked indefatigably for the reconstitution of the army. In Aug. 1917 Gen. de Ceuninck became Minister of War and De Broqueville succeeded Baron Beyens as Foreign Minister. One of his more important actions was to establish a war Cabinet of six members on the model of those in France and England. In Jan. 1918, however, he was succeeded as Foreign Minister by M. Paul Hymans, already a member of the war Cabinet. It was found that in Sept. 1917 De Broqueville had transmitted to M. Briand peace proposals secretly made by the Germans through Von der Lancken, head of the political department in Brussels, without informing his colleagues in the Cabinet, and this incident seriously diminished his power. In Jan. 1918 he took over the charge of the new department of national reconstruction, but in June of the same year his resignation of the premiership was accepted by the King. At the end of the war he became Minister of the Interior in the Delacroix Cabinet, and retained this office until Nov. 1919, when he retired, having the same year been created a count.

DEBS, EUGENE VICTOR (1855–), American labour leader and socialist, was born at Terre Haute, Ind., Nov. 5 1855, of Alsatian parents. On leaving the public schools he became in 1871 a locomotive fireman, and four years later took a position in a wholesale grocery. In 1879 he was elected city clerk of Terre Haute on the Democratic ticket, and in 1881 was reëlected. During 1885 he was a member of the Indiana Legislature. Meanwhile, in 1880 he was elected secretary and treasurer of the Brotherhood of Locomotive Firemen and was chosen editor of the *Locomotive Firemen's Magazine*. When the American Railway Union was organized in 1893 he was elected president, serving four years. Under his leadership a strike on the Great Northern railway was won in 1894. The same year he led the strike which, beginning in the Pullman car plants, soon involved the railways leading into Chicago (*see* 6.124). Debs was arrested on the charge of conspiracy to kill, was acquitted, was later convicted of contempt of court for violating an injunction, and was sent to gaol for six months (May–Nov. 1895). At this time his study of socialism began, and in 1897 he allied himself with the movement, for a year acting as chairman of the National Council of the Social Democracy of America. After this was reorganized into the Social Democrat party in 1898 he was an influential member. In 1900 he was Socialist candidate for president of the United States, receiving 96,116 votes; was again candidate in 1904, 1908 and 1912, but declined the nomination in 1916. In 1907 he was appointed on the editorial staff of the *Appeal to Reason*, and his contributions attracted wide attention. In 1914 he became editor-in-chief of the *National Rip-Saw*, a socialistic paper published at St. Louis. After America's entrance into the World War he upheld pacifism, and in Sept. 1918, after a speech at Canton, O., he was charged with violation of the Espionage Act, was convicted, and sentenced to serve 10

years in the penitentiary. The sentence was upheld by the U.S. Supreme Court March 10 1919, and he entered prison April 13. In 1920, although still imprisoned, he was again nominated presidential candidate by the Socialists and received 915,302 votes, ranging from 25 in Vermont to 203,400 in New York. He was released on Christmas Day 1921, his sentence having been commuted by President Harding, but his forfeiture of rights of citizenship was not affected. He is the author of *Unionism and Socialism: a Plea for Both* (1904); *Liberty;* and *Industrial Unionism* (1911).

DEBUSSY, CLAUDE ACHILLE (1862–1918), French composer (*see* 7.906), died in Paris March 26 1918.

DE FILIPPI, FILIPPO (1869–), Italian scientist and explorer, was born at Turin April 6 1869. He studied medicine at the university of Turin, and became an assistant in the surgical clinic of the university of Bologna, occupying later the same position at Genoa. He subsequently became reader in operative surgery at Bologna, and pursued researches of great value in physiological and biological chemistry. In 1897 he joined the expedition of the Duke of the Abruzzi to Alaska as scientific observer, and took part in the ascent of Mount St. Elias. In 1906 Signor de Filippi again accompanied the Duke of the Abruzzi on an expedition to the Ruwenzori range of central Africa. The first detailed map of the higher part of this mountain region was a result of this journey, together with many valuable geological and other observations. In 1909 de Filippi went with the Duke's expedition to the western Himalaya and Karakoram mountains, when a peak 24,600 ft. in height, close to Mount Godwin-Austen, or K2, was ascended. He later (1913–4) organized and led an important scientific expedition to the Karakoram mountains and central Asia, under the auspices of the Indian and Italian Governments, and for his valuable investigations received in 1916 an hon. K.C.I.E. from the Indian Government. He has also received many honours from British and foreign scientific societies, and is a gold medallist of the English and Italian Royal Geographical Societies. During the World War he served in the Italian army medical service, and also lectured in England on subjects connected with the war.

He has published *The Ascent of Mount St. Elias* (1900); *Ruwenzori* (1909) and *Karakoram and Western Himalaya* (2 vols. 1912); besides many papers in scientific journals.

DEGAS, HILAIRE GERMAIN EDGARD (1834–1917), French painter (*see* 7.931). The Impressionist years, in which such typical canvases as "Women in a Café" and "Danseuses à la Barre" (sold in 1912 for 110,100 francs) showed Degas's complete break with the academic painters, his realistic outlook, and his mastery of *matériel*, notably pastel, ended with the eighth Impressionist Exhibition 1886, where he continued his realistic studies of modern life, showing drawings of the nude, of workwomen, and of jockeys. This marked his withdrawal from all public exhibitions. In the following years, until his death in 1917, Degas mainly concentrated on drawings and pastels of the nude, chiefly women at their toilets or in the bath, interspersed with returns to his favourite ballet subjects. At one time he almost abandoned the use of colour but returned thereto later. In his last years, ill-health and a forced removal from his studio prevented his working. Besides pastel and oil colour Degas also handled his favourite subjects in etching, aquatint and lithography. His work is to be seen in the Luxembourg (Caillebotte collection), the Louvre (Camondo collection), the Victoria and Albert Museum, the Tate Gallery, the British Museum, Boston (U.S.A.) Museum, the National Gallery, Berlin, and many private collections. Though closely associated with the impressionists and showing their sensitiveness to atmospheric colour, Degas was never one of them. An admirer of Ingres, and the great classical draughtsmen, he was himself a classic in his impersonal outlook. The increasing preoccupation of his art was the expression of form, chiefly by line, and to this must be ascribed his later concentration on the nude and temporary abandonment of colour. His figures are never impressions, but an elaborate synthesis of many sketches and much observation. An uncompromising realist in his subjects, Degas found in the art of the Far East a starting-point for combining the most ordinary and ungraceful attitudes of everyday life into an original, intricate and harmonious design.

See also P. Lafond, *Degas* (1918); A. J. Meier-Graefe, *Degas* (1920).

DELAGE, MARIE YVES (1854–1920), French zoölogist, was born at Avignon May 13 1854. He became a member of the French Academies of Science and Medicine, professor of zoölogy at the Sorbonne, Paris, and a Chevalier of the Legion of Honour. He was one of the first authorities on animal reproduction and questions of hybridism and heredity (*see* 23.116, 14.27, 22.478). For his exploit in keeping alive in 1886, in a tank at Roscoff, a specimen of Leptocephali until it developed into a conger, *see* 9.9. He died in Paris Oct. 8 1920.

DELAGOA BAY, Portuguese East Africa (*see* 7.942).—Improvements in port accommodation during 1910–21 were mainly in connexion with the transit trade with the Transvaal and the development of the coal trade. Coaling plant was erected in 1914–5 and other plant added in 1921, so that altogether 1,400 tons per hour could be loaded direct into ships' holds. A new ferro-concrete wharf, 1,614 yd. long, was completed in 1916. The wharf was amply provided with electric and steam cranes. In 1920 the building of a dry-dock was begun. Dredging vessels maintain a minimum depth of 21½ ft. over the bar. Lourenço Marques drained, given a good water supply, and largely rebuilt, had become by 1920 one of the finest cities in South Africa. Considerable sums had been spent in making marine drives and golf links, in erecting hotels and on other measures to convert the suburbs, notably Polana, into health and holiday resorts in the winter months (May–Sept., average temp. 64° F.). Pop. of Lourenço Marques (1912 census) 13,353—of whom 5,324 were whites, including 668 British. Pop., city and suburbs (1920 estimate) 20,000.

The convention of April 2 1909 between the Transvaal and Mozambique provided (for a period of 10 years) for free trade in the products of the two provinces and for facilities for the recruitment of natives of Mozambique for labour in the Rand mines (from 80,000 to 100,000 Portuguese natives are normally employed in the mines). In return Delagoa Bay was to be given 50 to 55% of the railway traffic in the areas of the Transvaal in which it competed with Union ports, *i.e.* Durban. This was an effort to adjust conflicting political and economic factors. Had Delagoa Bay been a British port it would have had nearly all the trade of the so-called competitive area, the route from it to Johannesburg being not only some 100 m. shorter than the route to the Rand, but having easier gradients. During 1910–12 the division of traffic favoured Delagoa Bay. Rate adjustments followed and the share of Delagoa Bay in 1916 fell to 31% and thereafter showed no marked recovery. A proposal made by Senhor Freire d'Andrade (sometime governor of Mozambique) that the part of the province S. of the Sabi river—including Delagoa Bay—should join the South African Customs Union found supporters but was not adopted, and pending a new settlement the Mozambique Convention continued in force.

The following table shows the value of imports into and exports from the Union of South Africa via Delagoa Bay in the years named:—

	Imports.	Exports.
1909	£4,826,000	£ 253,000
1913	4,551,000	740,000
1918	2,308,000	1,100,000

Coal bunkered at Delagoa Bay was 136,000 tons in 1912; rose to 426,000 tons in 1917–8 and fell to 251,000 tons the succeeding year. In the same period (1912–9) the coal exported rose steadily from 179,000 to 589,000 tons. Most of the coal exported goes to Indian ports. The coal comes almost entirely from the Witbank mines, Transvaal. Besides coal Delagoa Bay receives from the Transvaal for export copper, tin, asbestos and maize. The export of copper on a considerable scale dates from 1913. It quickly attained the first place in regard to value (£573,000 in 1916 compared with £199,000, the value of the coal exports the same year). Exports of commodities produced in the province developed slowly. In 1913 they were worth £162,000, the chief item being sugar (£62,000); they fell during the period of the World War. Imports for consumption in the province reached the value of £1,083,000 in 1912.

Shipping remained mainly in British hands, though between 1905 and 1913 German shipping increased by 60%. In that year British shipping was 66 and German 18% of the total. After 1914 the shipping was almost wholly British and Portuguese. In 1917 the vessels cleared numbered 736. The Union of South Africa maintains an agency at Lourenço Marques.

The *Manual of Portuguese East Africa* (1920), a British Admiralty publication, gives useful information in respect to the relations of Delagoa Bay to the Transvaal. (F. R. C.)

DE LA GORCE, PIERRE (1846–), French historian, was born at Vannes June 29 1846. He devoted himself to the study in particular of the history of the 19th century, and produced various works of much learning, the chief being *Histoire de la Seconde République Française* (1887), *Histoire du Second Empire* (1896–1905) and *Histoire religieuse de la Révolution* (1909). He was in 1914 elected a member of the French Academy, and in 1918 published a monograph, *Deux Frères: André et Pierre de Gailhard-Bancal.*

DELAND, MARGARET WADE (1857–), American writer, was born at Allegheny, Pa., Feb. 23 1857. She studied in private schools and at Cooper Union in New York, and for a time was a teacher of drawing. She lived in Boston after her marriage in 1880. She appeared as a writer of graceful verse in *The Old Garden* (1887), and in 1888 attracted wide attention with her first novel, *John Ward—Preacher.* This story resembles in theme Mrs. Humphry Ward's *Robert Elsmere*, at that time a centre of discussion. In all her works she deals with religious and social questions, and at first evoked protest in some quarters. Her method is perhaps best seen in *Sidney* (1891); *Philip and His Wife* (1894); *The Awakening of Helena Richie* (1906) and *The Iron Woman* (1911). Her numerous works include *The Story of a Child* (1892); *Old Chester Tales* (1899); *Dr. Lavendar's People* (1903—in Dr. Lavendar some have seen a character comparable with Goldsmith's Dr. Primrose); *Partners* (1913); *The Rising Tide* (1916); and *The Promises of Alice* (1919), the romance of a New England parsonage.

DE LA REY, JACOBUS HERCULES (1847–1914), Boer soldier (*see* 7.944), who was concerned in the rebellion headed by Col. Maritz (*see* SOUTH AFRICA), was shot dead by a police patrol at Johannesburg, Sept. 15 1914.

DELAUNAY-BELLEVILLE, LOUIS (1843–1912), French engineer, was born at Corbeil Nov. 20 1843. Educated at St. Barbe and the École Polytechnique, he entered the Naval Engineering school in 1864 and in 1867 left to join the Belleville works at St. Denis, near Paris. He became a partner and finally head of the firm which produced the well-known Belleville boilers (*see* 4.145), and also the automobile called by his name. From 1890 he was president of the Paris Chamber of Commerce. He died at Cannes Feb. 10 1912.

DELAWARE (*see* 7.947).—In 1920 the pop. was 223,003, as compared with 202,322 in 1910, an increase of 20,681, or 10·2%. The number per sq. m. in 1920 was 113·5; in 1910, 103. In 1920 the native whites constituted 77·5% of the total, foreign-born whites 8·9%, and negroes 13·6%. Of 10,508 illiterates in 1920, 4,700 were negroes, 3,373 foreign-born whites, and 2,427 native whites. In 1920 for the first time the urban pop. exceeded the rural; urban 120,817, or 54·2%, rural 102,186, as compared with 97,085 or 45·8%, and 105,237 respectively in 1910. The change was due chiefly to the growth of Wilmington, as Kent and Sussex counties remained strongly agricultural. One county, Newcastle, showed an increase, the other two decreases. Wilmington, a centre of war-time manufactures, had in 1920 a pop. of 110,168, as compared with 87,411 in 1910, an increase of 22,757, or 26%. The pop. of the other chief towns in 1920 was as follows: Dover, the state capital, 4,042; Newcastle, 3,854; and Milford, 2,753.

Manufactures.—Delaware, especially Wilmington and the upper end of the state, was influenced by the great industrial activity of the World War period. Most noteworthy was the part taken by the duPont powder interests in supplying the needs of the Allies. The following table gives interesting comparisons between the pre-war period and the year following the Armistice.

	1919	*1914*	*1909*
Number of establishments	668	808	726
Proprietors and firm members	593	735	722
Salaried employees . .	3,344	2 643	2,024
Wage earners (average number)	29,035	22,155	21,238
Capital	$148,207,598	$69,323,927	$60,905,671
Salaries	7,709,068	3,399,568	2,322,329
Wages	37,265,319	11,382,160	10,295,596
Cost of materials . .	85,432,938	31,649,265	30,937,801
Value of products . .	165,073,009	56,034,966	52,839,619
Value added by manufacture	79,640,076	24,385,701	21,901,818

In 1919 the principal industries were leather, pulp goods, cars and general shop construction and repairs by steam railway companies, iron and steel, canning and preserving of fruits and vegetables, and foundry and machine-shop products.

Agriculture.—After the passage of the Agricultural Extension Act (1911) the most significant movement was the development of coöperative associations, and especially (1918–21) the rapid growth of the Farm Bureau movement. In 1920 the number of farms was 10,140, as compared with 10,836 in 1910, a decrease of 696, or 6·4%. The preceding decade had shown an increase of 1,140, or 11·0%. The value of all crops for Delaware, in 1919, was $23,058,906. The total value of cereals was $9,638,010; of hay and forage crops $4,366,174; of vegetables, including potatoes, $6,271,714; and of fruits and nuts $2,566,807. As compared with 1900, the total value of all crops showed an increase of 166·6%; cereals 105·4%; vegetables 242·2%; and fruits and nuts 188·3%. These figures, of course, reflect the changed price level. The production of strawberries for 1919 was 4,362,473 qt., of apples 606,286 bus., of peaches 227,375 bus., and of grapes 1,445,121 pounds. The total value of live stock, horses, mules, cattle, swine, in 1919 was $7,373,260; of dairy products, excluding "cheese sold" (not reported), $2,442,253.

Education.—The most distinctive development in the decade beginning in 1910 was in the field of education. There was much discussion of educational matters, and an aroused public interest led to various measures for the strengthening of the public-school system. In 1913, a summer school was established for the training of teachers, and four years later the state agreed to pay the expenses of teachers in attendance. In 1913, also, the Women's College of Delaware was founded, affiliated with Delaware College, with the same president and board of trustees and in part the same faculty, but entirely separate in buildings, classes, and student organization. Delaware College showed rapid expansion. It had property worth $1,800,000 (1921), and an income of $382,000 (1920). The enrolment (1921) was 478,178 women and 300 men, not counting 80 ex-service men in vocational agricultural work. After 1913, following reorganization and reincorporation, the college was solely a state institution. In 1917 a commission was appointed to investigate educational conditions, and to recommend plans for unifying, revising and developing the public-school system of the state. The commission employed the General Education Board of New York to make this survey, and the results, when presented to the Legislature in 1919, were crystallized in the "New School Code." The advantages claimed were: (1) the codification of the whole body of school law; (2) definite and fixed responsibility of school officials; (3) a modern and fairer system of taxation; (4) a carefully graded system of schools; and (5) a normal school year of 180 days for pupils from 7 to 14 years of age. The whole plan centred in a state Board of Education, composed of five members, with a state commissioner subordinate to them. Also, there were county boards and county superintendents in each of the three counties. In 1920, however, this system was considerably modified in the direction of lower taxation and greater local control, and in 1921, because of these influences, the ultimate fate of the Code seemed very uncertain. Wilmington grew so rapidly that its government, utilities, educational institutions, etc., were no longer adequate to its needs. In 1921 the city schools were surveyed under the direction of the national Bureau of Education and many needed reforms pointed out. At the same time proposals were being made for a new charter, providing for a commission form of government and a city manager.

Finances and Taxation.—The state system of finances and taxation underwent considerable modification and extension. After 1917, Delaware raised and spent about $1,500,000 annually. For a number of years previously the state's expenditures exceeded the revenues, but at the close of 1918 the balance in the general fund was $533,692.89, and on Jan. 1 1920 the balance was $1,367,733.57. This swift change was due both to the creation of new sources of revenue and to the increased returns from old sources, especially the latter. The railway tax was established in 1897, the

corporation tax in 1899, the automobile tax in 1907. One new source of revenue was the state income tax of 1917, the first $250,000 of this going to the school fund, the surplus, if any, to the highway department. In 1917, also, the collateral inheritance tax was changed to a direct graduated inheritance tax, with a consequent revenue for 1919 of $199,033. Apart from these sources increased sums came from fees and from the corporation, automobile and franchise taxes. The much-discussed corporation tax became the state's main reliance as a revenue producer. A state banking department was created (1919), with a banking commissioner and a deputy, whose duty it was to examine every bank at least once a year. In 1917 the budget plan was adopted for a two years' trial, but in 1919 it was not continued. In 1921 the plan was again under discussion with a reasonable chance of adoption. State finances were reënforced by the "Federal Aid" revenue. In 1919 the receipts from the Federal Government were $135,294.52, distributed as follows: (1) $50,000 to Delaware College under Federal grants; (2) $9,472.69 for vocational education; (3) $75,821.83 for road construction.

History.—The two dominant facts in the history of the state in the period 1910–20 are: (1) the passage of a considerable number of modern and progressive laws, and (2) the reaction of the state to the strenuous demands and activities of the World War. In the latter respect, Delaware met the situation squarely and was well organized, with the various war-time activities centred in the state Council of Defense, of which Secretary of State E. C. Johnson was the directing spirit. The number of troops furnished by the state in the World War was 7,484, and the amount raised in Liberty and Victory loans $103,898,350. In this period two progressive governors, Charles R. Miller and John G. Townsend, by their qualities of leadership, accomplished much for the state. During the administration of the latter, for example, a number of important statutes were enacted, including a Child Labor law (1917), a Workmen's Compensation Act (1917), laws for the regulation of hours of labour for women, an Income Tax law (1917), a Direct Inheritance Tax law (1917), an Act creating a state banking department (1919), and a thorough revision of the school laws, known as the New School Code (1919). These Acts, together with the Agricultural Extension Act (1911), mark a new era in the development of the state. After 1910 the Republicans maintained their control of state affairs, electing the following governors: Simeon S. Pennewill (1909–13); Charles R. Miller (1913–17); John G. Townsend (1917–21); and William D. Denny (1921–). Much of the time, however, the Democrats controlled the House of Representatives, and in 1916 they elected part of their state ticket. In 1921 the senior U.S. senator, Josiah. O. Wolcott, was a Democrat; the junior senator, L. Heisler Ball, a Republican. In the presidential election of 1921 the Democrats carried the state, in 1916 and 1920 the Republicans won by a considerable margin. A third characteristic of the period should be mentioned. Public-spirited citizens of the state contributed large sums for education, for public highways, for child welfare, for charitable purposes, and for other worthy causes. It has been estimated that the gifts of Mr. Pierre S. duPont to public education total $3,653,540.35. Gen. Coleman T. duPont completed and presented to the state a modern highway 20 m. in length, extending from Shelbyville to Georgetown. Under a state highway commission this work was extended by a magnificent system of highways, either under construction (1921) or projected.

DELBRÜCK, HANS (1848–), German historian (*see* 7.952).—Under the old regime Prof. Delbrück vigorously opposed the policy of the Prussian Government in dealing with the Danes and the Poles, with the result that he was twice subjected to disciplinary penalties as a professor and therefore, in Prussia, a civil servant. From 1889 to 1920 he edited the *Preussische Jahrbücher*, the most important political magazine in Germany. He was the author of a great number of articles and works, of which the following were published after 1910:—*Numbers in History* (1913); *Regierung und Volkswille* (1914); *Bismarcks Erbe* (1915); *Krieg und Politik* (1918); *Kautsky und Harden* (1920) and *Ludendorff, Tirpitz, Falkenhayn* (1920). Special attention may be called to the book *Regierung und Volkswille*, in which Prof. Delbrück attempted a defence of the old system of government in Germany and Prussia with particular reference to its "dualism," *i.e.* parliamentary representation and simultaneously a certain degree of autocracy on the part of the sovereign in Prussia and of the federated Government in the empire. At an early stage of the World War he became pessimistic regarding the possibility of any real success for Germany except by military and political strategy and tactics of a purely defensive character. He was, on tactical rather than on moral grounds, a strenuous opponent of intensified submarine warfare, and did not conceal his conviction that the result of this method of warfare would ultimately be the intervention of America. After the Armistice of Nov. 1918 he devoted himself mainly to endeavours to prove that Germany could not be made solely responsible for the outbreak of war, although she had formally declared war upon Russia and France. He was one of those who were sent to Versailles during the Peace Conference in order to draw up a statement of the German case with regard to the responsibility for the outbreak of war.

For a succinct statement of Prof. Delbrück's views on this subject and an English reply see articles by Delbrück and J. W. Headlam-Morley in the *Contemporary Review* (March 1921).

DELCASSÉ, THÉOPHILE (1852–), French statesman (*see* 7.953), returned to office in the Monis Ministry of Feb. 1911, as Minister for the Navy, a post which he retained when Caillaux succeeded Monis, and in the Poincaré Cabinet which was formed on Jan. 9 1912 after the fall of Caillaux over the Moroccan negotiations. He was appointed ambassador in St. Petersburg on Feb. 20 1913, and became once more Minister for Foreign Affairs in the reconstructed Viviani Cabinet on Aug. 26 1914. In this post he was actively concerned in counteracting the efforts of German diplomacy throughout the world, and particularly in England. He resigned from the Cabinet on Oct. 14 1915, partly on account of differences of opinion as to the advisability of proceeding with the dispatch of the expedition to Salonika in the changed conditions created by the resignation of M. Venizelos, and partly on the grounds of ill health.

DELHI, India (*see* 7.954).—The planning and laying-out of a New Delhi has been in progress since 1912, as the outcome of the official transfer of the capital of British India to Delhi from Calcutta, announced by the King-Emperor George V. at the Coronation Durbar on Dec. 12 1911. Two inauguration stones were laid by the King-Emperor himself on Dec. 15 1911, when he said: "It is my desire that the planning and designing of the public buildings to be erected will be considered with the greatest deliberation and care so that the new creation may be in every way worthy of this ancient and beautiful city." The first step taken was the appointment of a town-planning committee to advise on the choice of a site for, and a layout of, the new capital. This committee consisted of Capt. G. S. C. Swinton (chairman), Mr. J. A. Brodie and Sir Edwin Lutyens. Mr. V. Lanchester was subsequently consulted by the Government on certain aspects of the question. After a full consideration of all possible sites near the existing city of Delhi on which a new capital could be built, they found two alternative sites, known respectively as the Northern and Southern Sites—the former to the N. of Delhi and to the W. of the range of rocky hills which run S.W. from near the village of Wazirabad (3½ m. N. of the Kashmir Gate), giving a belt of land gradually increasing in width from W. to E. between the hills and the river Jumna; and the latter to the S. of Delhi and to the E. of this range.

The committee's first report was issued on June 13 1912, and with regard to the Northern Site, on which the Durbar camps of 1911 had been pitched and where the inauguration stones were laid, they found it had some general advantages:—This area is upwind and upstream of the existing city of Delhi; the ruins of the Delhis of the past do not cumber the ground; whilst external communications might need improvement, the area is fairly well served by existing railways; roads, canals and internal communications could be made convenient without excessive expenditure, and a good deal of money had already been spent on the area in connexion with the Durbar. But its disadvantages were found to be overwhelming:—the site was too small for the proposed new city, and part of the area was liable to flooding.

The committee therefore recommended the site on the eastern slopes of the hills to the S. of Delhi, on the margin of the area occupied by the Delhis of the past. They found this site free from liability to flooding, with a natural drainage. It was

not too much cumbered with monuments and tombs needing reverent treatment and, whilst it was reasonably near the centre of the existing city, it was capable of almost indefinite expansion southward. The committee had also examined other areas in the neighbourhood but found none suitable for the purpose. No good site existed E. of the Jumna. Similarly the Naraina Plain, on the western slopes of the hills to the S. of Delhi, was not recommended mainly because a new city built there could hardly be considered to be Delhi at all, and the area was destitute of historical associations and shut out by the hills from all view of the existing city. This area was, however, found suitable as a site for the new cantonment.

The publication of this first report aroused considerable interest both in India and in England. Articles in the Indian press expressed a preference for the Northern Site, a predilection which had also been felt by the town-planning committee when they commenced their labours. In Dec. 1912 Sir Bradford Leslie read a paper before the Indian section of the Royal Society of Arts in London, in which he set forth plans for building the new capital on the Northern Site and producing a fine water effect by a treatment of the river Jumna. The town-planning committee therefore, in Feb. 1913, issued their second report, in which they restated the arguments for and against the Northern Site.

"The soil is poor on the Northern Site as compared with the Southern. The Southern Site is already healthy and has healthy surroundings. The Northern Site, even after expenditure on sanitary requirements, will never be satisfactory. If the Northern Site is to be made healthy, this involves going outside the site itself and making the neighbourhood healthy also. The building land to the S. is generally good. On the N., to be used at all, it has in places to be raised at considerable cost. There is no really suitable healthy site for a cantonment in proximity to a city on the Northern Site. The exigencies of fitting in the requirements to the limited area of the Northern Site endanger the success of a layout as a whole and tend to make for cramping and bad arrangement. The resolt of placing a city on the Northern Site appears to the committee to be the creation of a bad example in place of a good one."

In Feb. 1913 a committee was appointed to consider the comparative healthiness of the Northern and Southern Sites. The committee reported on March 4 1913 "that no doubt can exist as to the superior healthiness of the Southern Site, the medical and sanitary advantages of which are overwhelming when compared with those of the Northern Site." The committee therefore, on March 20 1913, issued their final report with a layout for the proposed new city on the Southern Site.

The focal point of the new city (see map) is located on Raisina Hill, and the buildings of the Government Centre are arranged symmetrically about what is practically an E. and W. axis connecting the focal point with the northwestern or Talaki Gate of the old fort of Indrapat or Purana Kila. The two great blocks of secretariats are situated to the N. and S. of this focal point, with Government Court between them. Westward from Government Court, a raised platform or forum connects Raisina Hill with the high ground of the southern ridge, so that the whole Government Centre appears to be built on a spur of the ridge itself. This raised forum is known as the Viceroy's Court and at the western end of this court is situated Government House. The Viceroy's Court is also reached both from the N. and S. by roadways with easy gradients and at the intersection of these roadways with the E. and W. axis of the court is placed the Jaipur Column surmounted by the Star of India.

Government Hoose itself is also approached both from the N. and S. along fine avenues and to the westward of these avenues lies the viceregal estate, with its gardens and parks, wherein are located the bungalows of the viceroy's private and military secretaries, and the surgeon and comptroller, the quarters for the viceroy's troops and bodyguard and for other staffs connected with the viceregal estate. The southern of these two avenues leads from Government House to the residence of the commander-in-chief in India.

Below the eastern façade of the secretariats a forecourt, known as the Great Place, is laid out. This is partially enclosed by a beautiful Sanchi railing in red sandstone and is adorned with six water basins and fountains. In two chambers, one in each basement of the two secretariats, the chambers being entered from the Great Place, are now installed the inaugural stones laid by the King-Emperor, surmounted by the royal insignia cast in bronze.

Eastward again, below the Great Place, is a park known as the Central Vista, planted with lines of jaman-trees and having two water basins, one on either side of the central roadway, for the whole of its length. On either side of this Central Vista are arranged the houses of the members of Council. The Central Vista at its eastern end opens out into a park, hexagonal in shape, in which is to be built the All-India War Memorial Arch. This central parkway was intended ultimately to terminate at a small lake, the waters of which would wash the base of the northern end of Indrapat.

A second principal avenue of the city intersects at right angles the Central Vista about midway in its length. In the four angles formed by this intersection were planned four large buildings, to accommodate, amongst other institutions, the Imperial Record Office, the Ethnological Museum, the Medical Research Institute, a Library and War Museum. At the northern end of this avenue is situated the business and commercial centre of the city. This consists of a circus, 1,600 ft. in diameter, around which are arranged 12 blocks of buildings, each three storeys high. At this circus the new post and telegraph office is to be located. Of the 12 roads which radiate from this centre, that due N. will give a state entrance to the new joint railway station. This same avenue, southward of the Central Vista, will sight on to the Anglican cathedral, around which are built the residences of the principal officers of Government.

The avenue radiating due N. from the focal point of the city on Raisina Hill sights on to the Roman Catholic cathedral, all around which are situated the houses of the Indian and European superintendents and clerks of the secretariats, the Lady Hardinge Medical College and Hospital for Women being slightly to the north-east.

A little towards the E., the next main avenue passes through the business centre already referred to, and sights in the distance on to the dome of the Jama Masjid in the old city. Immediately below the northern block of the secretariats is placed the building designed to accommodate the Council of State, the Legislative Assembly and the Chamber of Princes. A little farther eastward, the next avenue sights on to the proposed Delhi University.

Facing now due S., an important avenue leads to the club, with the racecourse beyond, a large recreation park being slightly to the W. and Safdar Jang's mausoleum slightly to the east. Turning again a little farther to the E., we overlook the Lodi Park, in which are situated the tombs of the Lodi dynasty.

The eastern side of the city will be largely occupied by the residences of ruling princes and chiefs and prominent Indian gentlemen.

At the Royal Academy in 1914 there were exhibited drawings by Sir Edwin Lutyens and Mr. Herbert Baker (the architects jointly responsible), which showed how it was proposed to treat the main architectural problems of the new capital. Government House and the two blocks of secretariats were planned as one group or capitol facing eastward, with the afforested southern ridge behind it to the west. A prolonged "battle of the styles" has been waged over the New Delhi, and if these designs give satisfaction to neither of the extreme and opposed schools, they clearly showed an endeavour to apply, with due regard for Indian sentiment, the spirit of the great traditions of architecture to the solution of structural problems conditioned upon Indian climate and requirements. The inspiration of these designs is manifestly Western, but they combine with it distinctive Indian features without doing violence to the principles of structural fitness and artistic unity.

Government Court has a length from W. to E. of about 1,100 ft. and a width between the two blocks of secretariats of aboot 400 feet. These buildings have been designed by Mr. Baker. The eastern end of each block is marked by deep loggias looking out over the Central Vista. In the centre of each block is a dome. In the case of the N. block this marks an entrance hall; in the S. block it surmounts a conference hall with a suite of reception-rooms. Each block contains four floors: on the main ground floor are the general offices of the departments; on the first floor are the offices of members of Council, secretaries and other officers; whilst the remaining floors are occupied by clerks' rooms and records. An essential feature of the design, and one which sets the character of the whole building, is the provision of loggias and recessed gateways or exedrae giving views through to the fountain courts situate in the interior of the blocks, and these take the place of the continuous verandahs that are so familiar a feature of Indian buildings. The architect relies for control of temperature on these loggias and recesses, on thick external walls, together with window shutters as adopted so widely in southern Europe, and on the wide chajja characteristic of Oriental buildings. The Viceroy's Coort is about 600 ft. in width and 1,300 ft. in length and it will be treated with grass, waterways and fountains and shady trees, and will form a dignified approach to Government House. Here will be erected the column, funds for which were provided by the Maharaja of Jaipur.

The great portico of Government House is raised some 20 ft. above the level of the Viceroy's Court and 35 ft. above the surrounding country. The house itself centres round the great Durbar Hall, a domed structure which dominates the scheme of the buildings surrounding it. Grouped round the Durbar Hall are the state rooms and the great stairways from the entrance courts on the N. and S. sides. Projecting from this central block are four wings: that on the S.W. contains the viceroy's private apartments; in the S.E. wing accommodation is provided for the A.D.C.'s to the viceroy; guests are accommodated in the N.W. wing; whilst the N.E. wing contains the offices of the Viceroy's private and military secretaries. On the W. side of the house will be a raised garden, walled and terraced after the manner of the Moghals. This building, with the subsidiary buildings of the viceregal estate, has been designed by Sir Edwin Lutyens.

The building which will accommodate the Legislative Chambers is circular in plan and surrounded by a colonnade. The plan is divided into six sectors, utilized respectively by the Council Chambers and subsidiary accommodation for the Council of State, the Legislative Assembly and the Chamber of Princes, with three open courts separating these three chambers. A common library is situated in the centre of the building. The foundation stone for this building was laid on Feb. 12 1921 by the Duke of Connaught, and the building has been designed by Mr. Baker.

The All-India War Memorial is to be a monument in the form of a triumphal arch. It will be built in white stone upon a red sandstone base and will rise to a height of 162 feet. It will be surmounted by a flare, so that on occasions of commemoration a column of smoke by day and of flame by night will rise. The structure consists of a mass pierced through from E. to W. by the great arch, 87½ ft. high and 35 ft. wide, which spans the Processional Avenue. The piers thus formed are pierced by smaller arches which run through at right angles to the main arch. The freedom from intricate ornament and the simplicity of the design give the monument an appearance of dignity. Above the great cornice is inscribed the one word "INDIA," flanked by the dates "1914" and "1919." This monument was designed by Sir Edwin Lutyens, and the foundation stone was laid by the Duke of Connaught on Feb. 10 1921.

The estimate of cost for those works in the new capital which were being carried out by Government, according to the revised figures available in March 1921, was Rs. 12,91,80,000 (or at Rs. 15 to the £1, £8,612,000).

On Oct. 1 1912, by proclamation, there was constituted the Administrative Province of Delhi under a chief commissioner. This area was taken entirely from the old Delhi district of the Punjab. Delhi province had originally an area of 528 sq. m., to which was added later an area of 45 sq. m., to the E. of the Jumna river and taken from the United Provinces, to serve as a grazing ground for the cattle of the city. The total area of the province is now therefore 573 sq. m., comprising, on the basis of the census of 1911, a pop. of 412,821. (H. W. M.*)

DELISLE, LÉOPOLD VICTOR (1826–1910), French bibliophile and historian (*see* 7.964), published in 1909 his edition of the *Rouleau Mortuaire du B. Vital, Abbé de Savigni*, and also *Les Actes de Henri II.* (vol. ii appeared in 1916). He died at Chantilly July 22 1910.

See R. L. Poole, *Léopold Delisle* (1911); X. Delisle, *Lettres de Léopold Delisle* (1911–4).

DELIUS, FREDERICK (1863–), English musical composer, born at Bradford, Yorks., Jan. 29 1863, was educated primarily at the International College, Isleworth, and was destined by his parents for a mercantile career. To Delius the prospect thus held out was unendurable, though, rather paradoxically, when he declined the business career proffered to him in Bradford, he set out for Florida, where he established himself as an orange planter. His spare time, however, was devoted to such musical study as he could obtain from such books as were in his diminutive library. In this sense he, like Elgar, was self-taught. But he quickly broke away from orange-groves and betook himself to Leipzig, where he underwent a more or less regular course of training at the hands of Jadassohn, though probably he learnt more of practical use from Grieg who at that time was resident in Leipzig studying the art of scoring for a modern orchestra. In or about 1900 Delius took up his abode at Grez-sur-Loing (S. et L.), near Fontainebleau, which subsequently was his principal domicile, though he travelled in many lands. He was in Norway in 1897 when his incidental music was produced to Gunnar Heiberg's *Folkeraadet*, and, by its satirical use of the National Anthem, set the town by the ears. Meanwhile compositions flowed from his ready brain. He gave a concert of some of them in London in 1899 when his *Légende* for violin (composed in 1892) was produced. In 1893 his fantasie-overture *Over the Hills and Far Away* was done by Dr. Haym at Elberfeld, and followed in 1897 by his pianoforte concerto in C minor. This fine work, however, was ultimately recast and produced in London at a promenade concert in 1907 by Theo. Szanto, a Hungarian pianist. But before then, in 1896, Delius's first opera, *Koanga*, was in the making. It was produced at Elberfeld in 1904. His second opera, *Romeo and Juliet in the Village*, was first performed at the Komische Oper in Berlin in 1907, and subsequently was given by Sir Thomas Beecham at Covent Garden in Feb. 1910 and, in a revised version, in 1910. A third opera, *Fennimore and Gerda*, was staged at Frankfurt a/M soon after the Armistice.

In between the intervals of opera-composing, Delius was very busy producing purely orchestral works, or works for chorus and orchestra for the concert room. Thus *Life's Dance* dates from 1898; *Paris: the Song of a Great City* from 1900; *Appalachia* (1903); *Sea Drift* (1904); *A Mass of Life* (after Nietzsche, 1905); *Brigg Fair* (1908); *In a Summer Garden* (1908); *Requiem* (1909); a *Poem of Life and Love* and *Eventyr* (1919). Besides all this Delius composed a violin concerto and a double concerto for violin and violoncello, a violin and a 'cello sonata, and a string quartet, many songs and several *a capella* choruses.

DEMOBILIZATION AND RESETTLEMENT.—No labour problem of greater difficulty has ever had to be faced than that of national demobilization, whether military or civilian, after the World War, because of the dimensions to which the calling-up of national man-power had attained. An account of post-war demobilization and resettlement in industry, in the United Kingdom, from the civilian point of view, divides itself into three clearly marked periods: (A.), the preparations during the pre-Armistice period; (B.), the action taken immediately after the Armistice; and (C.), during the first two years of resettlement. (For the Army demobilization, *see* Army.)

(A.) Pre-Armistice Period

There were two lines upon which British Government preparations proceeded during the pre-Armistice period in respect of civilian workers:—

(*a*) The bringing of workers demobilized from munitions work and war work as quickly and as conveniently as possible to peace work.

(*b*) The rapid turnover from war to peace so that employment might be available for the largest number at the earliest moment. For the provision for unemployment, see the article Unemployment.

(*a*) *The Bringing of Workers Demobilized from Munitions Work and War Work.*—In making plans for the demobilization of civilians account had to be taken of the possibly simultaneous demobilization of the armed forces. The ideal would have been to have fitted civilian workers into their places before the forces had been demobilized so that there should be no confusion as between the two masses of demobilized persons. In point of fact it was recognized from the outset that it would be impossible to complete one process before the other began, first because industry could not in many places be started up again without the return of numbers of pivotal men with the forces, and secondly because large numbers of men with the forces had either a statutory right or a promise to return to a particular employment. It was accordingly necessary to frame a scheme for civilian workers which could work conveniently side by side with the scheme devised for the demobilization of the forces. The demobilization of the forces took into account throughout the necessity of approaching the matter, subject to paramount strategic considerations, upon an industrial basis. From the first report on military demobilization, signed in Dec. 1914 by Sir H. Llewellyn Smith and Sir R. H. Brade (as secretaries of the Board of Trade and War Office respectively), right through to the second interim report of the Ministry of Reconstruction Committee on the demobilization of the army, in Oct. 1917, this aspect of the question was steadily faced. It was recognized that demobilization must be so arranged as to render the transition from war to peace as easy as possible, which meant arranging it so far as possible to fall in with the immediate needs of the post-war industrial situation.

The principles upon which the recommendations as to military demobilization proceeded must be briefly explained, in order that the way in which these were related to those laid down for civilian workers may be appreciated.

The objects aimed at were to reduce unemployment to the lowest possible point, but at the same time to make adequate provision for such unemployment as was inevitable. In order to meet the first point it was recommended that demobilization should, subject to military exigencies, be carried out according to the requirements of trade and industry, which meant disbanding first men for whom employment was ascertained to be available or men in trades specified in a priority list drawn up with reference to the relative urgency of the industrial requirements of the country. To meet the second object the committee recommended the provision of a free unemployment insurance policy to be given on demobilization.

The object of the army scheme, which was to get men to the place where they could be employed as rapidly as possible, formed also the first part of the civilian demobilization scheme. The questions of civilian demobilization were considered from this point of view partly by the Civil War Workers' Committee, appointed by the Ministry of Reconstruction, which issued five reports during 1918, partly by the Ministry of Labour, and partly by the Labour Resettlement Committee set up by the Ministry of Labour. The recommendations of these various bodies are arranged not in the order in which they were actually made, but in relation to the order of the events with which they dealt.

The first point to be considered was the order of discharge from munitions works, just as the first point to be considered in army demobilization was the order in which men should be released from the colours. On this it was recommended by the Ministry of Labour —and the recommendation was accepted by the Cabinet—that the order of discharge should be as follows:—

(*a*) That adequate notice of discharge should be given to each individual worker.

(*b*) That adequate notice of the discharge ought to be given to the local employment exchange so that the exchange might be able to find employment for the worker.

(*c*) That the order of discharge should be: first, workers not dependent on industrial employment for a livelihood; second, workers brought from a distance; third, workers who could be readily absorbed in their previous occupation or in one of the staple industries of the district.

It was regarded as of paramount importance that the previous industrial experience of the workpeople who were to be dismissed, and the demand for workpeople of their experience elsewhere, should be adequately considered by factory managements in consultation with the officials of the Ministry of Labour before the selection of the individuals to be discharged was made.

In order that persons discharged should be able to travel to their homes at the earliest possible moment, or to their new places of employment, it was recommended in the fifth report of the Civil War Workers' Committee that free railway passes should be issued to those persons who had changed their place of residence for the purpose of taking up work on munitions or on naval or army contracts, and who might be displaced from such employment owing to the cessation of hostilities. In such cases the worker should have the option of having his or her fare paid either to the usual place of residence, or to some other place at which work is available.

After the question of the order of discharge there was the question to be considered of the actual machinery for bringing workers into touch with possible employers. On this the following recommendations were made by a committee of the Civil War Workers' Committee: (*a*) Steps should be taken by the Government, through the machinery of the employment exchanges, to assist war workers to return to their former employment. In addition joint industrial councils and similar joint bodies for individual industries should be taken into consultation. (*b*) Steps should be taken as soon as there was a reasonable prospect of peace to ascertain where war workers would be required. (*c*) Workers should be encouraged to register their requirements. Proposals were also made as to limiting the flow of juvenile entrants into the rank of wage earners by means of prolonging the school age, and further schemes were proposed for watching the placing of young persons in industry.

Action on these recommendations was possible during the pre-Armistice period only in so far as it would not disturb the munitions output by giving workers the impression that peace was in sight before the facts justified this belief. It was therefore not possible until immediately before the Armistice to take full advantage of the proposals for bringing employers and workpeople into touch.

It was universally agreed that the machinery for demobilization must be found in the employment exchange system. It was, however, suggested that the employment exchange machine might break down under the heavy strain imposed upon it unless it were supplemented. The Minister of Labour had appreciated this aspect of the problem and in 1917 had appointed a series of local employment committees to advise and assist exchanges. These committees (*see* UNEMPLOYMENT) consisted of equal numbers of employers and employed presided over by a chairman nominated by the Minister of Labour. A committee was attached to each principal exchange area and its duties were generally to advise upon the work of the exchange and particularly to help in the task of the demobilization of civilian workers. The various schemes prepared by the Ministry of Labour were circulated to these committees, so that when the period of actual demobilization came they were fully prepared to handle them. In addition a central committee known as the Labour Resettlement Committee was set up by the Minister of Labour to advise the Ministry nationally, just as the exchanges were advised locally.

In the next place the actual machinery necessary to effect the rapid demobilization and transfer of workers was elaborated in detail by a Departmental Committee set up by the Minister of Labour. This committee divided its report into four parts:— (i) registration of workpeople under notice of discharge; (ii) distribution of completed forms of registration to exchanges or other local offices; (iii) negotiations with the previous or other employers of the workpeople in order that there may be no avoidable interval of unemployment after discharge from war employment; (iv) placing of workpeople in employment after their discharge.

Under these four heads the committee worked out in detail the registration forms and cards which would be necessary for an effective indexing of the workers. They worked out the system of interchange between the exchange at which a worker was discharged and the exchange at which he was to be reëmployed. They suggested a method by which, upon interchange of the forms, the exchange in the neighbourhood where the man sought employment put itself into touch with the employer, and notified the result of this communication to the exchange of discharge. Finally, they made proposals by which a worker previously engaged upon war work, seeking employment, could be traced so that he could be fitted into the general scheme.

Apart from these preparations for action to be taken upon the cessation of hostilities, certain action was being taken in respect of men returning, disabled or unfit, from the colours. This work was undertaken as a result of the recommendation of the Resettlement of Officers Committee under the chairmanship of Sir Reginald Brade, which recommended that "an Appointments Board for officers and men of like standing should be established under the control of the Ministry of Labour to operate with the existing University Appointments Boards or other approved bodies." There had been two departments dealing from different points of view with this problem. In 1915 a special department of the Ministry of Labour had been set up, known as the Professional and Business Register, whose work consisted in finding appointments for persons of the classes covered by its title. During the earlier years of the war its duties principally consisted in finding war employment for persons of the professional classes who were either unable to pursue their pre-war occupation owing to war conditions or who wished to be used upon national service. In addition there was established early in July at the Ministry of Munitions an organization known as the Officers' University and Technical Training Classes. These provided the means by which unfit officers and professional and business men in the ranks could attend universities, technical institutions and other centres of instruction during their period of convalescence. Candidates so trained, if still unfit for active service, were utilized to meet the immediate demands of Government departments.

Following upon the report of the Brade Committee it was considered convenient to combine these two departments under one control, and the Appointments Department of the Ministry of Labour was established in April 1918. Previous to the cessation of hostilities the department performed two functions: (i) the training of the convalescent serving officer, and (ii) the placing in employment of officers, whether trained or untrained, as well as of professional men. The training of the convalescent serving officer was in operation for more than 12 months previous to the Armistice. Some 4,000 cases passed through the training scheme. The officers received training for practically every professional and higher commercial appointment. At this stage, while demands still far outran supply, no considerable difficulties in placing the trained men arose.

These proposals affected officers. The placing of workpeople remained with the exchanges, but the question of the training of disabled members of the forces was also receiving attention. Joint committees were formed by the Ministry of Labour for dealing with this problem for a number of trades. These committees were generally on a national basis and devoted themselves to laying down conditions upon which trainees could be admitted into industry. Both as regards officers and men these two schemes, which formed the foundation of the large schemes, were operated after the Armistice by the Appointments and Training Departments respectively.

(*b*) *The Rapid Turnover from War to Peace.*—The proposals on this head may be considered under two aspects:—

(*a*) Proposals as to the way in which the Government should treat its contracts with a view to reducing the dislocation consequent on the change from war to peace to the lowest possible point.

(*b*) Proposals for development of industries in peace with special reference to the lessons learned during the war.

So far as munitions contracts were concerned there had to be considered (i) termination of contracts for the supply of munitions, (ii) disposal of stores, stock and material, machinery, etc., in the possession of the Government, and (iii) the arrangements for the disposal or post-war use of national factories with their plant and equipment.

With regard to contracts it was plain that to continue manufacture of munitions for a moment longer than the military situation required was in the highest degree uneconomic. At the same time regard had to be had to the fact that a sudden cessation of all contracts would lead to unemployment on a hitherto unexampled scale, and would, moreover, with regard to such munitions as guns and tanks, lead to the abandonment of manufacture at an advanced stage in the process. It was recommended by the Ministry of Munitions, and accepted by the Cabinet, that the manufacture of munitions should be terminated at the earliest possible moment, subject to discretion both as regards creating excessive unemployment and with regard to

the waste that would be engendered by the sudden cessation of the manufacture of expensive articles nearly completed.

With regard to the disposal of stores, the Surplus Stores Department of the Ministry of Munitions had been proceeding for some time with the day-to-day disposal of obsolete munitions, scrap, surplus machinery and other movable property no longer required by the Ministry. Owing to the enormous field covered by the Ministry this was a considerable operation, but one almost negligible as compared with the gigantic business which would have to be undertaken in respect of the accumulation of war stores on the cessation of hostilities. It was pointed out that large quantities of materials had been delivered to contractors to enable them to carry out their contracts, and plant and machinery had in many cases been installed in the works of manufacturers on terms which formed part of the contracts themselves. The Ministry of Munitions were made responsible for the disposal of these stores, and it was at that time considered not improbable that on the completion of this work the Ministry of Munitions would be converted into a permanent Ministry of Supply combining in itself the supply departments of the Admiralty, War Office, Air Force and even of the Stationery Office, and Office of Works.

The question of the post-war use of national factories was discussed as one of general policy. In labour quarters the view was strongly held that these factories should be put into commission immediately upon the cessation of hostilities to provide employment during the transition period, and thereafter should be operated by the Government in competition with private enterprise. These proposals were rejected. In the first place it was pointed out that for the immediate period of transition the factories would be useless. To convert a shell-producing factory into a factory for commercial purposes would take anywhere from six months to a year, and at the end of the year it was hoped that the worst period of dislocation would be over. Apart from this, on general grounds, it was felt that the Government by entering into competition with the private trader would to a great extent decrease rather than increase employment. The Minister of Munitions was therefore authorized to make arrangements for the disposal of national factories.

In fact, all the national factories, with the exception of a small number retained in connexion with the work of the Training Department to the Ministry of Labour, were disposed of. In addition to the cessation of contracts the Government's obligation in respect of placing further contracts in regard to peace requirements was also considered. It had long been maintained by labour opinion that the placing of Government contracts with special regard to possible unemployment would to a certain extent help to reduce unemployment. When, however, the volume of peace-time contracts is compared with the general volume of trade, it becomes apparent that the most careful placing of such contracts can do little to mitigate a situation in which unemployment is really serious. While this is so, in so far as Government contracts and contracts placed by public bodies can alleviate the situation, it was recommended that Government departments and public or semi-public bodies should be urged to place contracts for their peace requirements at the earliest possible moment. In point of fact this recommendation failed of its effect because public bodies (like private employers), being utterly unable to foresee the course of prices during the transition period, were not disposed to run the grave financial risks involved.

Proposals were further made with a view to the development of industry immediately upon the cessation of hostilities. These proposals took two forms: (*a*) proposals for obtaining new markets and the materials necessary for post-war manufacture, and (*b*) the actual development of the various industries.

Under the first head it was contemplated that the reconstruction of the devastated areas of Belgium and France would necessarily bring large orders to the British manufacturers. It was accordingly proposed that an International Commission should be appointed to investigate the question of reconstructional work in the devastated areas of Belgium and northern France and to prepare schedules of contracts. Proposals were further made with a view to stimulating those industries, such as dyes and glass, which had during the war taken over processes previously carried on by the Germans.

With regard to materials, the early history of munitions supply had indicated that in the handling of raw materials lay the key to the control of industry. Metal and ore during the war had been controlled by the Priority Department of the Ministry of Munitions, wool and textiles (except cotton) by the War Office, and cotton by the Board of Trade. Two steps were taken to apply similar principles to the period of reconstruction. In the first place a Priorities Committee of Cabinet Ministers was set up as the ultimate authority for the allocation of raw materials. In the second a standing council was established consisting of leading representatives of commerce, industry, labour and the departments concerned to advise the Cabinet Committee. Ancillary to these bodies control departments for building were established under the general direction of the Ministry of Reconstruction. Under these general authorities special committees were set up for various trades to consider the nature and amount of supplies of materials and foodstuffs which, in their opinion, would be required by the United Kingdom during the period which might elapse between the termination of the World War and the restoration of a normal condition of trade

With regard to the development of industry, the future of engineering, agriculture and electric power were held to be the burning problems of the moment. So far as the employment of women was concerned attention was directed to their rights as competitors with men and the means by which they could be encouraged to revert to domestic service.

Engineering.—The first engineering committee was appointed by the Board of Trade under the chairmanship of Sir Clarendon Hyde and made certain recommendations dealing with essential industries, the amalgamation and joint working of existing firms, apprentices, technical education, trade combination, trade marks and patents. In particular it recommended that "every effort should be made to develop and encourage the medium and light engineering trades, whether already existing in this country or not, thereby making use of the workshop motive power and equipment installed for war purposes, and finding suitable employment for the large body of semi-skilled and female labour recently created."

This last recommendation was accepted by the Government, and the Minister of Reconstruction appointed a further committee, known as the Engineering Trades (New Industries) Committee, under the chairmanship of the Hon. H. D. McLaren:—

"To compile a list of the articles suitable for manufacture by those with engineering trade experience or plant, which were either not made in the United Kingdom before the war, but were imported, or were made in the United Kingdom in small or insufficient quantities and for which there is likely to be a considerable demand after the war, classified as to whether they are capable of being made by (1) women, (2) men and women, (3) skilled men, and setting out the industries to which such new manufactures would most suitably be attached; and to make recommendations—

"(*a*) On the establishment and development of such industries by the transfer of labour, machines and otherwise;

"(*b*) As to how such a transfer could be made, and what organization would be requisite for the purpose, with due regard to securing the coöperation of labour."

This committee appointed sub-committees to deal with the various branches of engineering.[1]

Agriculture.—So far as agriculture was concerned, in 1915 the Prime Minister appointed a committee under the chairmanship of Lord Selborne. Their first report resulted in the setting up of the Agricultural Wages Boards which have regulated the wages of agricultural workers. The final report, presented in Jan. 1918,[2] dealt with the problems of small holdings, land reclamation and drainage, credit facilities for land settlers, village reconstruction, and rural transport.

Electric Power.—Two committees were set up to deal with electric power supply. The first, appointed by the Board of Trade, under the chairmanship of Sir Archibald Williamson reported:[3] (*a*) that a highly important element in reducing manufacturing costs will be the general extension of the use of electric power supplied at the lowest possible price; (*b*) that the present system under which a supply of electricity is provided in a large number of small areas by separate authorities is incompatible with anything that can now be accepted as a technically sound system; (*c*) that a comprehensive system for the generation of electricity, and, where necessary, reorganizing its supply, should be established as soon as possible.

The problem was further considered by the committee of chairmen on electric power supply.[4] They reported (*a*) that the development of electricity should take place on a national scale and under the control of the State; (*b*) that an Electricity Board should be set up to advise upon and control the carrying out of the national scheme, assisted by an operating executive; and (*c*) that the first duty of the Board would be to plan out a comprehensive scheme for the whole country, and then by degrees to secure the development of electrical power over the whole of the United Kingdom by such methods as they might find suitable to the requirements of different areas.

In this way the committee of chairmen reduced the general principles enunciated by Sir Archibald Williamson's committee to practical proposals, though proposals still on a universal scale. The electricity commissioners under the Ministry of Transport were the tangible result of these recommendations.

(B.) Immediate Post-Armistice Period

On Nov. 11 1918 the Ministry of Munitions issued to contractors, sub-contractors and workpeople engaged on work for the Department, a notice indicating the line of action to be followed. The instruction proceeded on the following lines:—

1. There should, as far as possible, be no immediate general discharge of munition workers.
2. All workers, however, who desire to withdraw from industry or to leave for any reason, and all workers who can be absorbed elsewhere, should at once be released. Production on contracts for guns

and gun munition, machine-guns, small arms and small-arms munition, trench mortars, bombs and stores, pyrotechnic stores, aerial bombs, or accessories of the above stores, aircraft and air engines, and the manufacture of explosives, should be reduced in the following ways: (*a*) all overtime should be immediately abolished; (*b*) systems of payment by results may be temporarily suspended; (*c*) where reduced hours are worked upon a time-work basis, the number of hours worked must not be less than one-half of the hours in the present normal working week. If the earnings of workpeople fall below certain figures they will be made up to them by the State.

3. The adoption of half-time may cause discharges, but these should be spread out for as long a period as possible.

4. Free railway facilities will be provided for workpeople from the place of employment to their homes or to places where they have new employment.

At the same time, the first announcement was made of the institution of a temporary non-contributory scheme for unemployment which would remain in force pending the introduction of a general contributory scheme, the main provisions of which were that unemployed men were to receive 24s. per week and women 20s. (later increased to 30s. and 25s.), with additional allowances for dependants. Almost immediately afterwards instructions were issued in respect of war munition volunteers, war work volunteers, national service and war agriculture volunteers indicating that the schemes would be terminated at Dec. 14 1918. A notice was issued at the end of Nov. dealing with soldiers released from the colours, and army reserve munition workers.

These instructions indicated the methods by which the employment of these men under war conditions would be terminated. They followed to a large extent the lines of the recommendations prepared by the committees mentioned above; but it was felt by the Government that it was necessary to constitute a special department for dealing with problems of civil demobilization. Accordingly, at the end of Nov. a Controller-General of Civil Demobilization and Resettlement was appointed and his department was attached to the Ministry of Labour. This department was made responsible for:—

(*a*) the actual machinery of the return both of the men from the forces and civilian workers to their previous occupations through the employment exchanges;

(*b*) attempting to remove from the labour point of view obstacles to the restarting of industry; and

(*c*) the administration of the Appointments Department which dealt, on a rapidly increasing scale as demobilization proceeded, with the training and placing of ex-officers and men of similar educational qualifications. To these functions were added later the responsibility for the Civil Liabilities Resettlement Scheme.

The first few months were a time of great difficulty and strain. On the one hand the machinery devised for demobilization of the forces was found to be too slow to meet the situation and a new scheme was introduced which enormously expedited the procedure. This led to a position when very large numbers of both ex-civilian workers and ex-service men were out of work at the same time. Immediately, therefore, protests were made, against the rapid closing down of factories engaged upon war work. Deputations were constantly received both by the Minister of Labour and the Minister of Munitions protesting against the closing of factories engaged upon war work, and during the end of 1918 and the early months of 1919 it was found necessary to keep certain factories engaged on munitions at work even though their products were not likely to be required. Every effort was made by the newly created Civil Demobilization and Resettlement Department to make the transition from war to peace work as easy and as rapid as possible. For this purpose at the end of 1918 it was decided to set up for each of the areas covered by the Ministry of Labour Employment Exchanges a divisional council, elected from members of the local employment committees to which reference has already been made. The business of these councils, which operated till the later months of 1919, was to coördinate the work of the local employment committee and particularly to help in the transition from war to peace. In order to assist the councils in their work a number of officers known as Resettlement Officers were appointed by the Minister, whose business was to travel round the country and investigate the causes which impeded the turnover from war to peace. Such conditions as a temporary shortage of materials, shortage of rolling stock, inability to recover premises required for business purposes commandeered by the Government, housing difficulties, and many other matters of this type were investigated and dealt with by these officers under the directions of the Minister and of the divisional councils. At the end of the year, the Government set up a minister in general charge of reconstruction problems, with a council designed to review the position generally and give instructions to the various departments concerned in the work. This council terminated its functions upon the formation of the Lloyd George Government at the beginning of 1919.

(C.) The First Two Years of Resettlement

The success of the preparations which had been made, and of the method in which the machinery was worked, is indicated by the figures of re-absorption of men demobilized. For six months after the Armistice there was a steady increase in the number of ex-service men unemployed, and at the beginning of May 1919, when about 3,300,000 men had been discharged, over 400,000 were recorded as drawing out-of-work donation. From that date, although the numbers discharged continued to rise, there was an almost uninterrupted fall in the number unemployed, until, at the end of July 1920, when demobilization was practically complete and over 5,000,000 men had been discharged, less than 150,000, or only 3%, were registered as unemployed.

These figures relate only to ex-service men, and in order to discover how far the ex-civilian workers had been reabsorbed, it is necessary to look at the unemployment figures for the same period. After the Armistice the number of civilian workpeople unemployed rose continuously until the beginning of March 1919, when nearly 800,000 were recorded as receiving out-of-work donation. After that date, however, there was a rapid improvement, and by the end of Sept. the number had fallen to about 100,000. Owing to changes in administration and in some cases to the exhaustion of benefit, the figures, no doubt, overstate the extent of the improvement, but, even when due allowance is made for these factors, it is clear that there was a remarkable recovery after March 1919. The evidence so furnished is confirmed by the statistics of unemployment among the members of certain trade unions which make regular returns to the Ministry of Labour. In these unions (mainly composed of skilled workmen) the proportion unemployed, which was 0·4% at the end of Oct. 1918, rose month by month after the Armistice until it reached 2·9% at the end of March 1919. From that date, however, it fell, and at the end of Sept. 1919 it was only 1·6%. There was a further rise in the winter of 1919–20, due to the strikes in the railway service and in the iron foundries; but the percentage fell again in the spring of 1920, and from March to June of that year, when demobilization was almost completed, it varied between 0·9 and 1·2%, much below the figure for any month in 1913, which was itself a year of good employment.

The consideration of these figures indicates that the turnover from war to peace had been effected with surprising speed and with remarkable lack of trouble. But while in the first 18 months after the Armistice trade would have rapidly recovered, provision was urgently required for certain large classes of ex-service men which may be grouped as follows:—

(*a*) the disabled who, although in receipt of pensions, required training to enable them to enter upon some occupation;

(*b*) youths whose apprenticeships had been interrupted;

(*c*) women thrown out of work by the turnover from war to peace;

(*d*) the ex-officer who, as a result of the war, was either unable or, for adequate causes, unwilling to resume his old occupation; and

(*e*) the large number of men who had had some small business or undertaking which had been seriously affected by the war.

So far as the first class was concerned two steps were taken—the first to place men in immediate employment, the second to train them for employment later.

Placing of Disabled Men.—During 1917 a scheme had been proposed by Mr. Rothband, of Manchester, for absorbing a proportion of disabled men in each industry. This scheme was fully canvassed during the later years of the World War, and finally, in Aug. 1919, was adopted by the Government. In that month the King's National

Roll for disabled men was inaugurated by Royal Proclamation, and the scheme itself was actually launched on Sept. 15. The basis of the scheme was to ask each industry to take disabled men into its ranks to a proportion of 5 % of the total employees. Individual employers who agreed to come into the scheme were given a certificate to that effect, and were entitled to use a special seal saying that they were inscribed upon the National Roll. Industries, of course, vary considerably in their power to absorb disabled men, and the 5 % was not rigidly enforced, but they were invited to take as large a percentage as the nature of the work permitted. The scheme worked with considerable success. At Feb. 19 1921 the number of employers on the roll was 24,278. The total staffs covered by them was 4,167,171; the number of disabled ex-service men employed was 270,552.

The Roll was headed by the King and Queen Alexandra. H. M. Treasury were entered upon the Roll in respect of Government departments and Government industrial establishments, and the Roll included the staff of the Houses of Lords and Commons and of the Law Courts. Special efforts were made to include local authorities upon the Roll, and at the date mentioned above there were 751 upon the Roll in England and Wales, and 68 upon the Roll in Scotland. In addition arrangements were made by which preference was given in allocating Government contracts to employers whose names were upon the Roll. It may be noted in this connexion that when the scheme was launched in Sept. 1919 the number of disabled ex-service men who had registered themselves as unemployed was 41,616. There is no doubt that in addition to the men registered there was a considerable number, perhaps as many as 20,000, who had not reported themselves—a fact which is proved by additional registrations which followed upon the inauguration of the scheme. As a result of the scheme the figure fell to 14,849 in Sept. 1920. Of these a considerable number were in Ireland, where the National Roll, for various reasons, could not operate.

Training dealt with three main classes: The disabled ex-service man who could not, owing to his disability, return to his pre-war occupation; the man whose apprenticeship had been interrupted by war service and could not be renewed without assistance from the State; and the woman who, by entering munitions work at an early age, had failed to acquire a woman's trade. In addition to these classes there was the fit ex-service man whose enlistment in the army or navy at an early age had prevented him from acquiring a skilled trade. For industrial reasons it was soon found that little could be done unless he had commenced an apprenticeship before the war.

On Aug. 1 1919, when the industrial training of disabled ex-service men was taken over by the Ministry of Labour from the Ministry of Pensions, about 10,000 men had already been trained, about 12,000 were under training, and some 75,000 more were estimated to be awaiting training. In dealing with this problem the policy of the Training Department was to associate the administration of industrial training with local education authorities, to retain and increase the coöperation already established in training matters with the trades and industries concerned, and to repair the shortage of training facilities by the establishment of Government instructional factories. The organization set up was based on the division of the country into 17 administrative areas, each under a divisional director.

The coöperation of the employers and workpeople of the industries and trades in which men were being trained had already been secured after protracted negotiations with the leading British industries, which were conducted in 1916 and 1917 by the late Mr. St. George Heath of the Ministry of Labour. These negotiations resulted in a series of agreements to which representatives of employers' organizations, trade unions and the State were contracting parties, providing for the precise length of the training courses, the regulation by each trade of the number of men admitted to training in it, and the proportion of the men's pay respectively contributable by the employer and the State. The training schemes were drawn up by the National Trade Advisory Committees, composed of equal numbers of representatives of employers and workpeople, and their supervision was carried out by Local Technical Advisory Committees, similarly constituted, without whose consent no man was to be placed into training.

The policy of concentrating training in the Government instructional factory, based on the closest possible imitation of the management, discipline, machinery and productive work of the ordinary factory, but differing from the latter in that its primary function is the output of trained men instead of finished goods, was the outcome of the great and growing demand during the war for semi-skilled workers, capable of setting free the skilled man for more complicated operations. The impossibility of obtaining a rapid supply of such workers through the ordinary workshop, which was too intent upon production to occupy itself with the scientific upgrading of unskilled labour, or through the existing machinery of the technical schools, which were out of touch with the requirements of modern large-scale manufacture, compelled the Government to set up institutions of its own. In these was evolved a system of intensive training capable of teaching in two or three months, to a woman hitherto accustomed only to house work, one or two of the simple operations involved in specialized repetition work and of turning her, for example, into a competent capstan hand. The considerations which led to the adoption of this system for the purpose of dilution applied even more strongly to the case of the disabled man.

Up to Jan. 1921 some 50,000 men had been trained or were in training under the Ministry of Labour in addition to the 10,000 already trained when they took over from the Ministry of Pensions. Fifty Government instructional factories had been set up with accommodation for 20,000 men, providing training in most skilled trades in the country and engaged on productive work ranging from the building of houses to the repairing of watches and clocks.

The chief trades in which training was given were mechanical and electrical engineering, building in all its branches, furniture-making and wood-working, boot- and shoe-making and repairing (hand and machine), tailoring (wholesale and retail), watch- and clock-making and repairing, brush-making, basket-making, motor mechanics and commercial work, besides a great number of smaller trades, or trades, such as textiles and pottery, in which the amount of training given has been more limited. A considerable number of men were trained entirely in employers' workshops, but in the majority of cases a preliminary period in an institution, either a technical school or preferably an instructional factory, was given before placing a man for the completion of his training with an employer. The experience acquired during the war, in connexion with semi-skilled workers, that instruction controlled and directed on scientific principles results in a surprisingly high rate of progress on the part of the learner, was amply confirmed when applied to training for skilled occupations.

Interrupted Apprenticeships.—Prior to the Armistice a special committee, appointed by the Ministry of Reconstruction, considered this problem, and, in consultation with the Labour and Resettlement Committee, prepared a scheme to enable those involved to complete their apprenticeship. It was recognized that each industry had its own problems and that no uniform scheme could be adopted. The Committee, therefore, contented themselves with laying down certain general principles which should be observed if State assistance was to be obtained. It was left to each industry, through an organization representative of employers and operatives, to prepare a detailed scheme adapted to the needs of the industry concerned and embodying these general principles, which may be summarized as follows:—

(i) Men in the last year of their apprenticeship on enlistment should be regarded as journeymen.

(ii) The unexpired period of apprenticeship should be reduced by not less than one-third of the time lost by service in H. M. forces.

(iii) The time, if any, during which a man worked at his trade while in H. M. forces should be counted as part of the original apprenticeship.

(iv) After reaching the age when his original apprenticeship would have terminated, or the age of 21, whichever was the earlier, the man should be paid not less than three-quarters of the journeyman's rate for the first half of the resumed apprenticeship and not less than five-sixths for the remainder. Towards such wages the State would pay a grant equal to one-third of the journeyman's rate.

(v) Provision should be made in the scheme for allowing the training in the employer's establishment to be supplemented by training in a technical institute, the State agreeing to pay fees and a maintenance allowance.

(vi) An agreement should be entered into by employer and apprentice under which the employer undertook to train the apprentice as a skilled workman, and the apprentice to complete his training with the employer.

Forty distinct industries, covering about 800 different trades, prepared schemes in accordance with the principles laid down above. These schemes varied in many details, especially as regards the wages payable and the rate of deduction to be made from the unexpired period of apprenticeship in respect of the time served in H. M. forces.

An additional scheme was prepared by the Ministry of Labour to cover unorganized trades and trades where the small number of apprentices did not justify a special scheme.

The number of apprentices brought under the scheme was, at the end of Jan. 1921, 43,500. These figures do not indicate the total number of persons who, whether directly or indirectly, had benefited as a result of the scheme. A large number of important firms, including the majority of the railway companies, took back their ex-service apprentices under conditions as good as, or better than, those laid down in the scheme, but preferred not to ask for State assistance. Government departments, such as the Admiralty, the Ministry of Munitions and the Post Office, adopted a similar course. Persons in their last year of apprenticeship on enlistment were treated as journeymen but did not receive State assistance.

It has been estimated that the number of persons who in this way indirectly benefited under the scheme was at least as large as the number of those who were formally brought within its provisions.

On Jan. 1 1921 the number of apprentices who had applied and were eligible, but for whom employers had not been found willing to enable them to complete their apprenticeship, was 300. It will be seen, therefore, that practically the whole of those desiring to complete their apprenticeship were enabled to do so.

One of the conditions attached to payment of State assistance was an undertaking on the part of the employer that he would give to the apprentice the training necessary to make of him a skilled workman. It became, therefore, the duty of the Ministry of Labour to take steps to insure that this undertaking was carried out. Employers

might otherwise draw State assistance and exploit the labour of the apprentices by keeping them on "repetition" work. A small staff of specially qualified officers was accordingly appointed to visit the firms having apprentices under the scheme, and satisfy themselves that the training given was satisfactory.

The training given to these apprentices was modelled on the training given to boys. Where such was the case it was not possible to take exception to what was in fact the methods customary to industry. But in investigating the training of the ex-service men, the officers were, in effect, making a survey of the methods of training customary in the skilled trades in the case of boy apprentices. No such survey had ever been attempted before.

As stated earlier, each scheme for an industry was prepared by some organization representative of employers and operatives in that industry. Much thought was given by the industry to the preparation of these schemes, and the methods and facilities for training, whether in the workshop or technical institute, were fully discussed. A scheme when finally adopted represented, therefore, a considered agreement within the industry. In connexion with the administration of the various schemes, many difficult questions of interpretation arose. The Ministry of Labour made no attempt to give an interpretation, but referred the question to the trade organization who had prepared the scheme, and accepted their interpretation; acting on the assumption that the only body fitted to give a decision was the organization responsible for the scheme. Where disputes arose between an individual employer and apprentice, it was provided in the agreement between the two that such dispute should be referred to the Trade Panel of the Local Employment Committee and that the decision of the panel should be final.

It will be seen, therefore, that the policy underlying the scheme was one of administration under the advice and direction of the various industries. This policy was adopted after careful consideration. It was felt that, in view of the widespread dislike of Government interference, any attempt to impose a scheme on industry was bound to fail, and that success could be looked for only if the coöperation of industry was sought and secured. This policy has been justified by its results. The Ministry of Labour, throughout, was able to count on receiving the fullest assistance, both from employers' associations and trade unions.

Women's Training.—The first women's training course was opened at the end of May 1919. This was a course of training for domestic service, and 16 young women passed through the 13 weeks' course and obtained good situations at its close. Altogether 84 centres for training in domestic service were established, and just over 2,000 women trained. The experiment proved successful and encouraging. The courses were held in widely differing conditions and localities, but under the excellent teachers the interest of the women was aroused and the majority went straight into service from the schools. These classes were held in various parts of London and the suburbs and in 42 towns throughout Great Britain.

Apart from domestic service, some 7,000 women were trained for industry. The department's training was from the first restricted by the terms of the Treasury grant "to normal women's industries which were women's trades or processes before the war," and to these, notwithstanding much pressure from women's organizations, the women's training branch rigorously confined its activities. Three other conditions limited the sphere of its industrial training, viz. a reasonable prospect of absorption in the industry after training, good working conditions, coupled with fair wages, in the trade, and the consent of the trade unions and the employers concerned to training being given. Exhaustive enquiry and constant watchfulness were necessary in these connexions.

The greatest demand for training, combined with the best prospect of absorption and most favourable conditions, was found in the two chief women's trades—dressmaking and tailoring; and 77 courses were provided, affording accommodation for 3,362 women.

The majority of these training courses came to an end on June 30 1920, though a limited number were continued for varying periods in order that the standard course might in each case be completed, viz. six months for an industrial and three months for a domestic course. From July onwards but few new schemes (and those solely of a domestic type) were started, but by this time the trade slump had begun, and it was useless to train women for industries in which the chance of employment was of the slenderest.

The training referred to above is that of women who were thrown out of employment by the termination of the war. The Women's Training Branch, however, was entrusted with the training of two other classes of women directly affected by the war, viz. soldiers' widows and disabled nurses. The powers of the State to give such training to these women as would enable them to supplement their pensions by employment were first vested in the Ministry of Pensions by Royal Warrant, but were transferred to the Ministry of Labour by Order in Council in the autumn of 1919.

Over 4,000 applications from widows were dealt with, and training found for over 1,200 of those who applied. During the training, which was in all cases free, an allowance was made to the widow in addition to her pension to enable her to meet any extra expense to which she might be put. A large number of widows were trained as practising midwives. Having a home and a pension they were able, as few women were, to accept the precarious livelihood which this calling offers in a rural district. As all had to pass the examination of the Central Midwives' Board, women of good general education only were selected for this particular branch. Another large group of the widows in training were those learning tailoring and dressmaking, home dressmaking being especially popular, possibly because the department was empowered to make a grant of a sewing machine on the completion of the course and also because the work could be carried out without interference with normal domestic ties and duties. Training in cookery, ladies' hair-dressing, confectionery, photographic studio work, and secretarial work was also given.

Applications received from disabled nurses were relatively few in number, as was to be expected, because those only were eligible who were in receipt of a disability pension under the Royal Warrant, and were not entirely disabled but physically unfit to practise as nurses. After the powers of the Ministry of Pensions were transferred to the Ministry of Labour in the autumn of 1919, 140 disabled nurses had by March 1921 been placed in training, out of 394 applicants. Some very sad cases were brought to light, many of the women proving physically unfit for the training desired, and for such application for assistance was made to the "Officers' Friend." Those remaining under training in March 1921 represented a great variety of occupations, including dispensing, massage and electrical treatment, public health appointments, secretaries and chauffeuses to doctors, poultry farming, etc.

Training and Placing of Ex-Officers.—The Appointments Department came into being during the war. Upon the Armistice its work developed very considerably both as regards training and placing in employment. In the first place, so far as training was concerned, under the decision of the War Cabinet given in Dec. 1918, funds were made available for higher educational training in universities, technical colleges, agricultural colleges, farms, professional firms, business houses, etc. The Board of Education, the Board of Agriculture and the Ministry of Pensions with the Ministry of Labour were made responsible for the administration of the scheme. The Appointments Department, by reason of its experience and provincial organization, operated as the machinery by which all the departments obtained information as to applicants, while the training for agriculture and higher educational training remained respectively with the Ministry of Agriculture and the Board of Education. The professional business and workshop training was transferred from the Ministry of Pensions to the Appointments Department. Under this scheme 17,311 ex-officers and men of similar educational qualifications had been placed by the Appointments Department in training at the end of Jan. 1921, while there were 1,864 waiting.

In connexion with the scheme selection committees were set up throughout the country, composed of prominent professional and business men in each district. The functions of these committees were to interview candidates who applied for grants, and to make recommendations to a body known as the Grants Committee at headquarters. The final decision in such recommendations rested with the London Grants Committee.

These committees worked in turn in conjunction with what were known as Interviewing Boards, whose functions were (*a*) to decide what applicants properly came within the purview of the Appointments Department; (*b*) to advise applicants as to their prospects of obtaining employment, and (*c*) to select applicants as candidates for the vacancies on the books.

So far as placing was concerned, upon demobilization the department undertook the work of acting as official agent between employers and their former employees, who were either officers or men of other ranks of similar educational qualifications. In this capacity the department facilitated the return to their pre-war employment of 169,321 men up to March 26 1919. In addition to this the department undertook special activities with a view to finding new appointments for ex-officers, and up to the end of Jan. 1921 it found employment for 48,860 men, with 10,720 men remaining unemployed.

Resettlement of One-Man Businesses.—In May 1916 the Military Service (Civil Liabilities) Department came into being to help the wives of serving soldiers where military service imposed serious hardship. The scheme was limited to men who had joined the forces since Aug. 4 1914. The general items in respect of which assistance was granted included rent, mortgage interest, payment in instalments of contracts such as the purchase of premises, business or furniture, rates and taxes, insurance premiums and school fees. The maximum amount granted was not to exceed £104 per annum. Up to the conclusion of this scheme on July 31 1920, 475,271 applications had been received and 312,810 grants had been made to a total value of £6,239,670. In Feb. 1919 the Government decided to extend the principle of this scheme with a view to resettling men in their previous businesses when they were, as a result of military service, suffering serious financial hardship. The scheme as amended took two forms: current assistance could still be given in respect of liabilities such as those mentioned above, or alternatively, a lump sum grant towards the restarting of a business might be given.

So far as the second class of case was concerned, the Civil Liabilities Department was not empowered to pay resettlement grants for new businesses except in the case of disabled men. In that case alone the disability was in itself treated as serious financial hardship, and powers were given to make grants for those men in respect of new businesses. Under this scheme up to the end of Jan. 1921, 251,259

applications were received; 95,651 grants were made at a total expenditure of £2,675,665. In addition there was a special scheme for providing tools for workmen who had to return to their pre-war occupations. Under this scheme £21,562 was paid out.

(H. Wf.)

United States.—United States troops continued to embark for Europe until the signing of the Armistice Nov. 11 1918. At that time, according to the final report of Gen. Pershing, 2,071,463 officers and men had sailed to serve with the A.E.F. and only some 15,000 had returned to the United States. According to figures compiled by the War Department, the total number of officers and men encamped in the United States on that date was 1,634,499 and more than 300,000 additional men had been ordered to be in camp before Nov. 30 1918. All draft calls were at once cancelled. On Nov. 26 orders were issued for immediate demobilization of the Students' Army Training Corps, which had been introduced Oct. 1 in about 500 colleges and universities throughout the country. This led to the discharge of some 150,000 students during December.

The question of general demobilization presented serious difficulties, and precedent offered slight help toward their solution. It was recognized that with peace would come a drastic curtailment of production in many industries, and it was feared that this curtailment and the sudden release of large numbers of soldiers would result in wide-spread unemployment and suffering. On the other hand the retention of a large army no longer needed would impose an unjustifiable financial burden upon the country. It was decided to discharge all emergency troops as rapidly as they could be dispensed with; but at the same time the Department of Labor was requested to watch carefully the labour situation, so that if desirable the rate of discharge might be reduced locally or as a whole.

The method of demobilization finally adopted differed from that employed by the European Allies. The plan of release by military "classes" based on age and length of service, natural in France and Italy, could not be applied in a country where the system of universal military service was unknown. It would have caused needless delay to attempt demobilization of the A.E.F. before beginning the release of men encamped in the United States. Neither was it feasible to follow England's system of "industrial demobilization." Profiting by the early mistakes of her Allies, America had not drafted indiscriminately into immediate service "key or pivotal men" from essential industries, but had placed them under deferred classification. Any attempt to demobilize by different occupations would have caused useless delay and might have impaired seriously military units overseas. It was therefore decided to demobilize by complete military units. In this way men returned to America under their own officers in orderly fashion. From the beginning, however, attention was given to individual requests for discharge, especially from American camps, if it appeared that men were needed by their families or their service required for industries. Speed of return from overseas was governed solely by transport facilities. About one-half of the American troops had been carried across in British vessels, which now were needed for home and colonial service. At the time of the Armistice transports belonging to the U.S. Government had a capacity of only about 110,000 a month. This was now rapidly increased by the release of battleships and cruisers. Use was made also of German passenger ships, and arrangements were made for the use of Italian, French, Dutch, and Spanish vessels. On June 30 1919, 173 vessels were in use as transports. After the Armistice embarkation camps were organized at Bordeaux, Brest, and St. Nazaire, and later at Havre and Marseilles. Le Mans was selected as a centre of distribution for the ports, and accommodations were ordered there for 230,000 men. There was considerable complaint of congestion and inadequate care of troops, especially at Brest, where there were normal accommodations for only 55,000 men, although that port alone was available for the largest transports. In America, Boston, Charleston, Newport News, and New York City were chosen as ports of debarkation.

Troops began to land in America in large numbers Dec. 2 1918, when the "Mauretania" reached New York with 4,000. By June 3 1919 there remained in France only 694,745 officers and men. The A.E.F. headquarters were closed in Europe in Sept. on the departure of Gen. Pershing. Practically the last remnant of the A.E.F. in France embarked with Brig.-Gen. Connor in Jan. 1920. There remained in Europe, besides the Graves Registration Service and special commissions, only the Army of Occupation in Germany. By June 30 1920 troops in Europe had been reduced to below 17,000.

Camps and cantonments in the United States formerly used for mobilization were converted into centres of demobilization, and to these were sent troops from overseas as well as those at home. Efforts were made to send each man to the demobilization centre nearest to his home or place of enlistment. Each man was given a rigid physical examination and those suffering from contagious disease were detained until there was no longer danger of infection. Discharge papers were prepared, accounts carefully settled, and an allowance of five cents a mile made each man from camp to his home. To encourage immediate return a reduced railway fare of two cents a mile was conceded those who departed within 24 hours after discharge. During the first three months of demobilization discharge required from four to seven days, but this was soon reduced to an average of two days. Gradually it was possible to reduce the number of centres, and beginning Nov. 25 1919 troops in America were discharged where stationed. Only two large centres were retained, Camp Dix, N.J., and the Presidio in San Francisco, for the use of troops returning from overseas, and even these were dispensed with after March 15 1920.

The following table prepared by the War Department shows the rapidity of general demobilization, month by month and cumulatively during the first year.

1918.	Officers.	Cumulative.	Enlisted Men.	Cumulative.
Nov. 11–30	593	593	43,000	43,000
Dec.	37,043	37,636	609,000	652,000
1919.				
Jan.	23,563	61,199	358,000	1,010,000
Feb.	14,913	76,112	263,000	1,273,000
March	11,479	87,591	263,000	1,536,000
April	12,185	99,776	298,000	1,834,000
May	14,622	114,398	383,000	2,217,000
June	13,588	127,986	391,000	2,608,000
July	16,404	144,390	361,000	2,969,000
Aug.	15,986	160,376	151,000	3,120,000
Sept.	8,716	169,092	73,000	3,193,000
Oct.	8,690	177,782	33,000	3,226,000

The cost per man of demobilization varied from month to month because the uncertainty of the number of men to be handled required the keeping up of all the demobilization machinery; for March 1919 it was $69.95 but for June only $20.07.

At each demobilization centre were stationed representatives of the U.S. Employment Service, and if the discharged man had no prospective job he was registered and a card given him for the local service representative nearest his own home. The Employment Service attempted to coördinate and coöperate with various local organizations, such as chambers of commerce, boards of trade, and patriotic and welfare societies. In Baltimore, Boston, Chicago, New York, and some other large cities, large bureaus were created for securing work for returned soldiers, sailors and marines. It is impossible to estimate the number of places secured through these agencies, as few kept accurate records. But the Employment Service alone, during the 10 months from Dec. 1 1918 to Sept. 27 1919, registered 758,474 men and secured employment for 474,085. It was seriously handicapped, however, by lack of adequate appropriations in 1919 and its operations were practically suspended after October. Although there were some industrial centres which, immediately after the Armistice, experienced a degree of depression, business as a whole was prosperous with the result that the great mass of the returning soldiers, many of whom returned to their old jobs, had little difficulty in finding employment. There was, of course, a certain percentage of discharged men who found it difficult or irksome to adjust themselves again to the conditions of civilian life; these were inclined to drift to the large cities, even though the opportunity for getting employment there was often less favourable than elsewhere. The surprising thing was not that a comparatively small number was unable to get work, but that so large a number could be absorbed without at any time causing an acute unemployment problem. One method early proposed for helping discharged men was that of awarding a soldiers' bonus. The Federal House of Representatives passed a Bonus Bill May 29 1921 by a vote of 289 to 92. The bill carried an appropriation of $1,600,000,000. Protest, however, arose throughout the country, largely due to the prospect of a great increase in taxation, and the Senate took no action. At its national conventions held in 1920 and 1921 the American Legion was almost unanimous for a bonus for all who had served. Several states have acted on their own initiative and voted on the question of granting a bonus to their citizens who served. According to statistics gathered

for *The American Legion Weekly*, up to the middle of May 1921 some form of bonus had been granted in 13 states, namely, Maine, Massachusetts, Michigan, Minnesota, New Hampshire, New Jersey, New York (later declared unconstitutional), North Dakota, Rhode Island, South Dakota, Vermont, Washington, and Wisconsin. The payment provided varied. In several states a lump sum of $100 was awarded. In most cases the veteran received a fixed amount for each month of service (usually $10 or $15) up to a maximum (varying from $120 to $600). Bonus bills had been defeated in 11 states, namely, California, Colorado, Connecticut (relief fund provided, the interest of which is to be used for needy men), Delaware, Indiana, Maryland, Oklahoma, Tennessee, Texas, West Virginia, and Nebraska (relief fund provided, interest to be used for relief). No legislatinn was contemplated in 14 states, namely, Alabama, Arkansas, Georgia, Idaho, Kentucky, Louisiana, Mississippi, Nevada, New Mexico, North Carolina, South Carolina, Utah, Virginia, and Wyoming. In the other states preparations were being made to act upon the question.

The American Legion.—While the World War was still in progress there arose spontaneously among the American soldiers a wide-spread desire that with the coming of peace there should be created a permanent organization for perpetuating their feeling of comradeship and its ideals. Active steps toward this end were first taken at a caucus held by a number of service men in Paris March 15–17 1919. This was followed by another caucus held in St. Louis May 8–10 1919, when preliminary organization was effected and the name "The American Legion" adopted. Incorporation was secured by an Act of Congress Sept. 16 1919. The first annual convention was held at Minneapolis Nov. 1919. The purpose of the Legion, according to its constitution, is: "To uphold and defend the Constitution of the United States of America; to maintain law and order; to foster and perpetuate a one hundred per cent Americanism; to preserve the memories and incidents of our association in the Great War; to inculcate a sense of individual obligation to the community, state, and nation; to combat autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness." The organization is non-sectarian and non-partisan. Any man or woman is eligible to membership who was in the military or naval service of the United States between the dates April 6 1917 and Nov. 11 1918 inclusive; also "all persons who served in the military or naval services of any of the Governments associated with the United States during the World War, provided they were citizens at the time of their enlistment and are again citizens at the time of their application." Exception is made of persons dishonourably discharged from service, as well as persons who refused to perform military duty "on the ground of conscientious or political obligation."

At the head of the Legion are a national commander and five national vice-commanders, elected by the national convention. The active director at headquarters is the national adjutant-general. Each state also is organized under a state commander and other officers. The local unit is called a post. On Sept. 30 1921 the number of posts was 10,795, located in every state of the Union and in the District of Columbia, the Philippines, Panama, Cuba and many other countries, including Canada, Mexico, Argentina, and France. The total membership at the same date was about 785,000.

The Legion strongly endorsed the proposed Federal bonus for all ex-service men; and, especially through its National Legislative Committee, was influential in giving publicity to the needs of disabled soldiers and in securing legislation in their behalf. To its efforts, in part at least, were due the enactment of the Sweet bill, providing for the Veterans' Bureau; the Veterans' Hospital bill, appropriating $18,600,000 for building or improving hospitals for ex-service men; the publication of lists of draft evaders in the *Congressional Record;* the bringing to the United States of the body of an "Unknown Soldier" for burial in Arlington National Cemetery; the bestowal of the Congressional Medal of Honor upon the British "Unknown Soldier" buried in Westminster Abbey, and upon the French "Unknown Soldier" buried under the Arc de Triomphe. The official publication is *The American Legion Weekly.* The Women's Auxiliary had a paid-up membership of 107,345 on Sept. 1 1921. At the national convention of the Legion in 1921 distinct organization was effected, and separate officers and headquarters were chosen.

DE MORGAN, WILLIAM FREND (1839–1917), English novelist (*see* 8.10), was born in London Nov. 16 1839 and educated at University College school and later at the college itself. He became a student at the Royal Academy in 1859 and in 1864 began the study of stained glass. Six years later he turned to ceramic work and soon became known in artistic circles as a potter, the "De Morgan" tiles being made remarkable by his rediscovery of the secret of some beautiful colours and glazes. But later in life he became even better known to the literary world through his novels, *Joseph Vance* (1906); *Alice for Short* (1907); *Somehow Good* (1908); *It Never Can Happen Again* (1909); *An Affair of Dishonour* (1910); *A Likely Story* (1912); *When Ghost meets Ghost* (1914), in which the influence of Dickens and of his own earlier family life were conspicuous. He died in London Jan. 15 1917. In 1919 *The Old Madhouse* was published posthumously. His last but unfinished novel, *The Old Man's Youth*, was published, with additions by his widow (1921).

DENBY, EDWIN (1870–), American public official, was born at Evansville, Ind., Feb. 18 1870. His father, Charles Denby (d. 1904), was minister to China 1885–08. He was educated in the Evansville schools, went to China with his father in 1885, and two years later entered the Chinese imperial maritime customs service. He returned to America in 1894, graduated from the Law school of the university of Michigan in 1896, was admitted to the bar and thereafter practised in Detroit. On the outbreak of the Spanish-American War in 1898 he entered the navy, and as gunner's mate saw action at Santiago. Later he was a member of the Michigan House of Representatives. From 1905 to 1911 he was a member of the National House of Representatives and was allied with the conservative Republicans. He served as chairman of the House Committee on Naval Affairs. When America entered the World War in 1917 he enlisted at the age of 47 as a private in the Marine Corps and was sent to the training station on Paris I., S.C. He was advanced to corporal and sergeant and was highly successful in training recruits. In Jan. 1918 he was commissioned second-lieutenant and passing through the various stages, before the end of the year had been promoted major. After the close of the war he was appointed probation officer of the Detroit Municipal Courts. In 1921 he was appointed Secretary of the Navy.

DENIKIN, ANTON (1872–), Russian general, was of humble descent and held democratic views. After going through the usual military training and service he joined the Russian general staff, and in the earlier period of the World War he rose to the rank of lieutenant-general and to the command of a division on the Danube front. During the Russian revolution he followed Kornilov, and was for some time chief of his staff. He was arrested with Kornilov and imprisoned in Bykova. They escaped together and fled to the Caucasian shore of the Black Sea. There he joined Alexeyev, who was forming a small army of volunteers, chiefly composed of officers. On Kornilov's death (March 31 1918) he became the military commander of the army, while Gen. Alexeyev held power as "Supreme Leader" of the Government and organized recruiting and supplies. They collected the army on the southern border of the Don region, at Metchetinskaya, and established coöperation with a Caucasian detachment, led by Erdeli, with the Don Cossacks under Krasnov, and some 2,000 men who had marched right through the southern steppes under Drozdovsky. By June the army counted some 12,000 men and was able to attempt the reconquest of the Kubañ territory. Things had changed considerably since March, when Kornilov's invasion came to a standstill in front of Ekaterinodar. The Kubañ Cossacks had had time to ascertain the true character of Bolshevik occupation, and the volunteers moved down the Rostov-Vladikavkaz line and the Black Sea line from Tikhoryetzkaya to Novorossisk The Reds, in spite of their numerical superiority, melted before this advance and one *stanitsa* (camp settlement) after the other joined the invaders. On Aug. 5 Gen. Alexeyev entered Ekaterinodar, the capital of the Kubañ,

and practically all the resources of the prosperous country were henceforward at the service of the volunteers. By the middle of Sept. the army had increased to 60,000 men. The Germans, whose garrisons had advanced to Rostov at the mouth of the Don, did not look on that extension with friendly eyes; they did their best to disintegrate the volunteer fighting forces, and at the same time tried to induce Alexeyev and Denikin to accept a condition of vassalage, similar to that which had been submitted to them by the Don Ataman, Krasnov. But nothing of the kind was possible in the case of Alexeyev and Denikin: their whole energy was directed towards a patriotic reconstruction of Russia, and they declined all overtures from the crafty foe. On Sept. 25 Alexeyev died after an illness which he had contracted during the World War, but against which he had struggled by sheer devotion to his task, never sparing himself, never relaxing his efforts. It was impossible to replace fully this man, who resembled one of the heroes of antique virtue. Denikin, who had to step into the breach, was not Alexeyev's equal in military genius or in statesmanship, but he was worthy of his predecessor in purity of character and in his sense of duty.

The revolt of Siberia and eastern Russia against the Bolsheviks prevented the latter from concentrating their forces against the dangerous volunteers, and the Germans were at the end of their tether in the struggle with the western Allies, and unable to use their position in Russia to any useful purpose. These favourable circumstances made it possible for Denikin to spread his wings wide. The Don Cossacks joined him, he established communications with Astrakhan and Ural Cossacks and the Orenburg province on the right, while on the left, his lieutenant Schilling moved towards Kiev and Odessa. There was some very heavy fighting in the centre, where Stavropol was taken after a struggle of several days, and 35,000 Reds surrendered or were exterminated. Towards the beginning of 1919 Denikin was master in the S. of Russia, and could begin to organize a base for an attack on the main block of the Soviet Republic. The principal Cossack armies had congregated round the nucleus of the Volunteer army. The latter had unfortunately suffered grievous losses in the ceaseless fights of the Civil War, which it had to conduct in miserable equipment, with hardly any ammunition except that which was taken from the enemy, in hunger and cold; some 30,000 of its best men had fallen, and these could not be replaced either by conscripts, driven in by command, or by the Cossacks, who could fight well when they chose, but who did not always want to do so. The difficulty of the political situation became apparent when the question of an arrangement between the various forces under Denikin was seriously raised. On Nov. 1 Gen. Denikin met the Regional Assembly (*Krayevaya Rada*) of the Kubañ territory. He made a powerful speech in which he said, among other things:

"Can there be any peace politics on the Kubañ? Will your long-suffering settlement be safe from a new and more cruel invasion of the Bolsheviks when the Red power establishes itself firmly in Moscow, when it throws back by weight of numbers the Volga front, when it presses on the Don from north and east and when it moves towards you?—No! It is time that people should cease to wrangle, to intrigue, to seek precedence. Everything should be sacrificed for the sake of the struggle. Bolshevism must be crushed, Russia must be liberated. Otherwise your well-being will not prosper, you will become the plaything of the enemies of Russia and of the Russian people. . . . There can be no talk of separate armies—the Volunteer army, the Don army, the Kubañ army, the Siberian army. These should be one army—the Russian one, and also one front, one Chief Command, endowed with full power, responsible only to the Russian people, as represented by its future supreme authority."

The speech did not produce the desired effect. It was criticized in the lobbies by separatists and by Socialists, but it was at least conceded to the Commander-in-Chief that a Government should be formed in which ordinary provinces, like Stavropol or the Black Sea district, should be subjected to an emergency military *régime*, while the Kubañ and to some extent the Don should be governed by independent institutions, though maintaining a kind of federal allegiance to the High Command. The Kubañ obtained, in fact, political autonomy, but agreed to place its forces under the command of Gen. Denikin. Yet the Ukrainian elements of the Rada contrived to send a special mission to Paris, and negotiated there with representatives of the Allies independently of the Russian "Political Council" and of S. D. Sazonov, the Foreign Minister of the South Russian Government.

For the conduct of the Government Gen. Denikin formed a "Special Council," which combined legislative and executive functions. It consisted of generals of the headquarters staff and the heads of departments, some 18 or 20 in number (Gens. Dragomirov, Lukomsky, Romanovsky, etc.; the civil members—Neratov, J. P. Shipov, N. Astrov, Stepanov, K. Sokolov, M. M. Fedorov, etc.). Most of the members belonged to the so-called National Centre and to the moderate Right. The Left was represented by four Cadets, of whom, however, two had drifted a good deal to the Right. The weight of authority rested with the generals, but there were long discussions and many compromises. It was attempted to steer a strictly "business course," politically colourless, but the Government did not succeed in achieving popularity. Gen. Denikin regarded this Assembly as a consultative organization, and gave his decision after listening to proposals and discussions. He insisted on keeping military restoration to the fore until the Bolsheviks had been laid low or at least until Moscow had been liberated. No pronouncement was allowed as to the form of Government, but the authority of the old Constituent Assembly, which was attempting to gather power in Ufa and Omsk, was rejected as the product of popular insanity. On the whole the Government was clearly leaning towards the Right, but Denikin was averse to any kind of acts of violence and oppression; his rule was, however, not free from contradictions and lacked political initiative. He followed the current more than he directed it.

His military plans were based on the idea that if he succeeded in driving the Bolsheviks out of the Russian provinces the population would reform behind his lines and set up compact patriotic levies against the hateful usurpers. With this purpose in view he pushed forward rapidly in all directions, and it seemed at first as if events justified his previsions. The Bolsheviks were driven back everywhere by the Volunteers and the Cossacks. When they rallied in the East and made a determined attempt to retake Tsaritsyn and turn the line of the Don they were repulsed and finally routed by Gen. Wrangel's Caucasian army. The Cossacks of Mamontov and Shkuro made raids deep into the lines of the enemy; officers and soldiers of the Red army deserted in thousands to the Whites; the population met Denikin's hosts as liberators with processions and the ringing of bells. Kursk, Kharkov, Voronezh, were occupied, and in July the advance guard reached Orel, some 200 m. from Moscow.

This rapid progress proved deceptive. The armies of liberation did not bring law and order with them. Not only were Commissars and prominent Bolsheviks given short shrift, but officers who had served in the ranks of the Reds and gone over to the Whites were subjected to irksome investigations and delays before obtaining "rehabilitation." The badly equipped and badly supplied troops laid hands on all sorts of goods and stores; it was hard to distinguish between requisition and looting. Such administrators as were introduced by the advancing army were more intent on bettering themselves than on looking after the population; the peasants felt themselves menaced by the revenge of the squires.

The people, driven to despair, took to flight, and the more adventurous among them formed "green" bands, which roamed about the country, seized stations, stopped trains, cut off provision columns. The most daring of these brigands, Makhno, made Ekaterinoslav his capital, and nearly overran Rostov in the summer of 1919. The most threatening symptom of all was the lack of union between the various sections of the Whites. The Kubañ was preparing for complete independence and negotiating with the Mahommedan mountaineers for a league. Denikin found it necessary to strike hard against the Separatists; the Rada was dissolved; one of the leaders, Kalabukhov, was shot as a traitor, and a new Government was formed from among the supporters of a closer union with the Russian army (Nov. 1919). The "line" Cossacks were favourably disposed, but the *coup d'état* did not succeed in uprooting the movement for an in-

dependent Kubañ republic in the south-west. On the contrary, the Separatists, though forced for a time to conceal their aspirations, were embittered, and resolved to wreck the combination with the Volunteers.

In the meantime the resistance of the Reds stiffened in proportion as the Whites lost the sympathy of the people. Soviet propagandists had no difficulty in rousing the apprehension of the Great Russian peasants against the advance of the "squires"; officers of the Red army became less keen to desert when they ascertained that they would be treated as suspects by Denikin's lieutenants. The relentless discipline re-introduced by Trotsky in the Red army was backed by the action of select bodies of privileged troops—international contingents of Letts, Chinese, Magyars, etc., picked Communist battalions, large bodies of cavalry trained for rapid marches and sudden concentrations against weak points of the line. In the beginning of Nov. Budenny's cavalry corps broke through the White lines at Kupyansk and threatened to cut off the Volunteer army from its base on the Don. The line rolled back and a general retreat set in. Denikin tried to stem the back flow by appointing Wrangel to command the Volunteer army in the place of Mayevsky, who had been indulging in reckless debauchery in Kharkov. But Wrangel was not a magician who could mend the consequences of errors which he had detected and criticized from the beginning. Town after town fell, and there was no hope of support from the Poles, who were by no means inclined to fight for the restoration of Russia. A British political mission headed by Sir Halford Mackinder, M.P., was more concerned with promoting the interests of Georgia, Armenia and Azerbaijan than in taking up the cause of Russian centralization. In these dire straits Denikin resolved to abandon his former policy in regard to the Cossacks, and summoned a central "Krug" (circle) of the Cossack armies—Don Kubañ, Terek, Astrakhan—with the object of starting a new Government on federal lines. It was agreed that there should be a Legislative Assembly of the Federation, and that Denikin should act only as Chief of the Executive and Commander-in-Chief. Even this surrender did not help. After a last success of the Volunteer army, which retook Rostov (Feb. 8), the final catastrophe came through a defection of Kubañ Cossacks on the right flank, of which Budenny's cavalry took full advantage. Rostov and Ekaterinodar had to be abandoned. Crowds of refugees gathered in Novorossisk in the first months of 1920; spotted typhus raged among them. The remnants of the Black Sea fleet and foreign ships carried loads of these wretched people to the Prinkipo Is. and to Lemnos, and Denikin himself left for Constantinople.

By way of an epilogue to the drama of discord which had embittered the minds and paralyzed the efforts of the Whites, Denikin's Chief of the Staff, Gen. Romanovsky, was murdered by two officers of the Volunteer army on the steps of the Russian embassy in Constantinople. He was a quiet, industrious man, who had come to recognize that there was no Conservative class in Russia capable of serving as a basis for government. He was therefore in favour of a closer alliance with the Moderate Socialists. This was an unpardonable heresy from the point of view of the Rights, and it was from this side that the shot came which put an end to the life of Denikin's trusty assistant. (P. Vi.)

DENIS, MAURICE (1870–), French painter, was born at Granville, Manche, in 1870. He studied at Julian's Academy and at the École des Beaux-Arts. As a student he came under the influence of Paul Sérusier, one of Gauguin's associates at Pont Aven, and became a prominent member of the *symboliste* group which included also P. Bonnard, K. X. Roussel and E. Vuillard. Inspired mainly by Cézanne and Gauguin, the *symbolistes* represented a reaction against impressionism, in favour of synthesis and the use of form and colour to express subjective states of mind. Denis was also associated with the *Rose Croix* group which aimed at substituting an idealist decorative art for the realism of the day. To these influences was added that of Italian quattrocento art, as the result of a visit to Italy in 1894. Denis early turned his art to religious purposes, but classical mythology has also frequently provided him with subjects. His most important work is his mural decorations, which include decorations for the chapels of the church of Vésinet (1899–1903); "L'Histoire de Psyche," five panels for M. Morosoff, Moscow (1908); "L'âge d'or," five panels for a staircase of the Prince de Wagram (1912); a frieze for the cupola of the Théâtre des Champs Elysées illustrating in four panels the history of music (1912); decorations and stained glass for the church of St. Paul, Geneva (1917–8); and a decoration for La Chapelle du Souvenir in the church of Gagny (1920). All these works show the influence of quattrocento Italy in the linear character of the design, and the preference for spare, stiff, angular forms, which connect Denis with Puvis de Chavannes. His colour, however, is much more vivid than that painter's, and shows an impressionist palette and method of handling. An artist of great fecundity, Denis has also produced many easel pictures including a "Hommage à Cézanne" (1901), somewhat in the manner of that painter; a portrait of Degas; and a long series of religious subjects typified by "La Meilleure Part" (1920). He has also illustrated among other books, Paul Verlaine's *Sagesse* (1891–1910), *The Imitation of Christ* (1903), and *La Vita Nuova* (1908). His frequent contributions on art to the reviews were republished in 1912 in *Théorie 1890–1910*, which contains much interesting comment on modern art. Denis has chiefly exhibited at the Société Nationale, of which he became full member in 1902, at the Salon des Indépendents, and at the Salon d'Automne. He is represented in the Luxembourg, Paris. In 1910 he was made Chevalier of the Legion of Honour.

DENMARK (*see* 8.23).—Since the incorporation of North Slesvig (1,496 sq. m.), returned to Denmark in 1920 according to the Treaty of Versailles, the area of Denmark proper is 16,958 sq. miles. About 75% of the area is occupied by cultivated land, about 10% by woods and plantations, while the rest, 15%, is either uncultivated or is used as gardens, building lots, roads, etc. Besides, the Faeroes (540 sq. m.) and Greenland (a little more than 770,000 sq. m.) belong to Denmark.

Population.—Since the incorporation of North Slesvig Denmark proper has something over 3,200,000 inhabitants, of whom about 150,000 live in North Slesvig. The Faeroes have 20,000 and Greenland about 13,000 inhabitants. In Denmark proper, apart from Slesvig, the density of pop. is 195 per sq. m. (325 per sq. m. on the islands, 127 in Jutland). One-fifth of the pop. lives in the capital, about another fifth in the provincial towns and about three-fifths in the country. The average death-rate in the years 1910–9 was about 13 per thousand, the average birth-rate 25 per thousand. Before the World War the overseas emigration was some 7,000 persons a year. In war-time it fell off, in 1918 to 800, rising again to 3,300 in 1919. The yearly increase of pop. is a little more than 1%, the average percentage of the years 1910–9 being 1·11. On the basis of the statistics of the years 1911–5, the average duration of life has been calculated at 56·2 years for men and 59·3 years for women, while 75 years earlier the figures were 40·9 and 43·5.

Communications.—The total length of roads in 1919 was about 28,000 m., some 4,300 m. being main roads. There were in 1921 about 2,700 m. of railways (Slesvig excepted), of which one-half was under State administration. Motor-cars numbered about 18,000, including about 2,300 taxis and omnibuses, 3,800 commercial vehicles and 12,000 motor-cycles.

Occupations.—In 1911 36% of the population were engaged in agriculture (horticulture, forestry and fishing included), about 27% in industry and manufactures and about 17% in commerce and transport. The remaining 20% included those occupied in different trades or in non-productive work, domestic servants, independent persons and those supported by the State. In 1901 some 40% of the population lived by agriculture and 14% by trade, transport, etc. Since 1911 this movement from agriculture towards other occupations has been on the increase.

Legislation.—In Sept. 1917 a joint-stock companies Act at last was passed, introducing directors' liability, public registration, protection of the rights of the minority, and public accounts.

Agriculture.—By a law of 1919 land held as feoff or by entail, large estates formerly undivided in succession (*Lehn*), was made freehold property. Owners must deliver to the Treasury part of the capital value of the estate and—on compensation—hand over to the State one-third of the fields for small holdings. In the same year it was decreed that property still held on lease should become freehold. This legislation, especially the Acts of 1919, concerning the parcelling-out of lands previously in the possession of the State and of entailed property passing into free possession, was a continuation of the movement, begun by the Cottars' Allotment Act of 1899, towards establishing a number of independent small holdings; in 1899 the idea was two acres and a cow; now legislation aims at 20 ac.; from 1899–1919 some 10,000 new small holdings had been established, the State holding the secondary mortgages.

In the middle of the 19th century the market price per *Tõnde Hartkorn* (Danish unit of land valuation, equal to 18 ac. good soil) was about 2,000 Danish kroner; in the first half of the 'eighties 6,500 kr.; prices declined till towards the close of the century, the price then being 5,200 kr., rising later to about 8,500 kr. in 1913. A constant rise took place during the war, prices in 1918 reaching 12,800 kr. per *Tonde Hartkorn*. This decline of prices from the middle of the 'eighties to the close of the century, due to the general fall in corn prices, was met by a change of the whole system of agriculture in consequence of which milk, butter, bacon and seed took the place of corn and live stock as chief product. This development continued till the outbreak of the World War. The new industries were based on the use of home supplies together with imported grain and artificial manure, the result being a very considerable output, especially of dairy produce, pork, eggs, cattle and horses. Only a part was marketable in Denmark itself, and a considerable export trade was developed, dairy products, pork and eggs mostly going to England.

During the war, and after the beginning of the ruthless submarine campaign, conditions were altered, the importation of raw materials being very much impeded. The import of corn and forage, including oilcake, amounted before the war to 1,700,000 tons annually, while Denmark's home production was 2,400,000 tons of grain: allowing 500,000 tons for food supplies and for industrial purposes, about 3,300,000 tons remained for forage. During the war the import of rye, maize, and oilcake partly, and in 1918 almost totally, failed; moreover, the harvest in the country was reduced by one-sixth owing to the want of artificial manure. Denmark was compelled to reduce its live stock. The number of cattle was in 1914 2,500,000 and after 1917 two million. Notwithstanding that the best milch cows were least affected by this reduction of stock, the output of milk and subsequently of butter was reduced by about 50%, butter from 117,000,000 kgm. in 1914 to 67,000,000 kgm. in 1918. But while in 1914 about 95,000,000 kgm. were exported, in 1918 only 15,000,000 kgm. were sent out of the country. Home consumption of butter was much more than doubled—due to the stoppage of the import of copra, the raw material for margarine. The number of swine, in 1914 about 2½ million, almost equalling the number of the population, was in 1917 reduced to 1¾ million and in 1918 to half a million. This reduction manifested itself in the rapidly decreasing export of pork, from 150,000,000 to 3,000,000 kilograms. The number of hens fell between 1914 and 1918 from 15 million to 9 million, export of eggs being in the same years 450 million and 320 million respectively. The number of horses and sheep was almost undiminished, about 500,000 of each.

After 1918, with the coming of peace, Danish agriculture recovered rapidly, but the production, especially of pork, was still in 1921 less than before the war. The butter and pork production is mainly in the hands of the farmers' own coöperative factories; thus, of the 1,380 Danish butter factories 1,168 are on a coöperative basis and about 90% of the swine killed in Denmark are taken to the coöperative slaughter-houses.

Two important laws relating to agricultural exports were that of May 27 1908, dealing with the control of meat exported from Denmark, and a similar law of April 12 1911, dealing with the control of butter. They were based on section 62 of the British Trade-Marks Act 1905, which enabled Danish farmers to register a common trade-mark as against all other trade-marks in these articles. Thus all exported meat or bacon receives a public trade-mark and a Government stamp showing it to have been passed for export at the control station either as first- or second-class produce. Agricultural goods for export can therefore receive an official trade-mark certifying the quality of the articles. No butter is allowed to be exported that contains over 16% of water, or other preservatives than salt.

Industry.—Manufactures dependent on the import of coal and raw materials did not develop in Denmark until about the last decade of the 19th century, as the country produces no coal and very little raw material apart from farm products and material for brick- and cement-making. It thus happens that Denmark as a whole is the loser in the years of high prices and so-called prosperity—the raw materials having to be bought abroad at the highest price level—and regains the losses in the years of depression. The rather small-sized factory is typical, but some big factories have been established in connexion with the manufacturing of leather and footwear, cement, margarine, textiles, tobacco, spirits, sugar, beer, oil, matches, paper, agricultural machines and iron ships. Of the 140,600 persons engaged in factories employing more than 20 working-hands in 1914 more than half belonged to Copenhagen. Most of the larger establishments belong to joint-stock companies. In 1919 there were 994 industrial joint-stock companies with a total capital of 621,000,000 kr., of which three-fourths belonged to companies with a capital exceeding 100,000 kr. each. During the last decades Danish industry has shown an increasing tendency towards centralization. Customs duties were considerably reduced in 1908, but as they are almost always calculated upon weight, the general advance in prices made the protection left to industry completely ineffective. During the blockade industry had to face difficulties regarding the importation of raw material and coal; but the blockade mainly affected industries producing oils and margarine, which were practically at a standstill in 1918. The failure of the coal supplies was met with the strictest economy in consumption and partially made up for by an energetic utilization of the native fuels—woods, peat and brown coal. In spite of heavy difficulties, Danish industry was to a large extent able to supply the demands of the home market.

On the whole the war period must be said to have been economically favourable to the neutrals, as appears from the formation of a number of new industrial concerns and the extension of many of those already in existence, and the fact that between 1914 and 1920 the number of companies increased by 50% and their capital by 150%. Industrial profits were largely invested in extensions and improvements which could not be turned to full account during the post-war depression. The following table shows the total number of persons, the number of skilled workers, and the horse-power of prime movers concerned in the principal industries in the year 1914:

	Total Number employed.	Skilled Workers.	Power. H.P.
Food	63,000	38,000	81,000
Textiles	17,000	14,400	16,300
Clothing	65,000	35,000	3,500
Building and Furniture	79,000	52,000	21,000
Woodwork	13,300	6,000	18,000
Tanneries	1,200	900	11,400
Earthenware and Glass	20,000	16,000	28,000
Metals	63,000	40,000	34,000
Chemical and Technical	13,000	9,000	15,000
Paper	3,500	3,000	7,600
Printing	12,000	9,700	4,200
Totals	350,000	230,000	230,000

Shipping.—At the close of 1913 Denmark's mercantile marine counted—apart from vessels of four-ton register or less—1,970 sailing vessels with a joint tonnage of about 90,000 tons register, 941 motor vessels of 30,000 tons register and 642 steamers of 420,000 tons register. At the close of 1919 the respective figures were 1,584 sailing vessels of 103,000 tons register, 1,465 motor vessels of 89,000 tons register, 514 steamers of 332,000 tons register. The number of Danish steamers sunk by submarines, torpedoes and mines was 147, representing a tonnage of 229,000 tons register in gross. The gross freight carried in Danish ships—excluding home coast traffic—amounted in 1913 to 110 million kr. and in 1919 to 445 million kroner. The average dividend on steamship shares was in 1919 70%. From 1916–20 foreign-going shipping of the country was controlled by a Freight Board, elected by the shipowners themselves. Rather generous maximum rates were fixed for the supplies of the country. Owners were bound to employ their ships according to the instructions of the board. In July 1917 an arrangement was made according to which all Danish owners put tonnage at the disposal of the Freight Board for the coal supply from the United Kingdom at a fixed rate and quantity.

Commerce.—The total imports and exports from 1912–20 were as follows:—

Year	Imports: Mill. kr.	Exports: Mill. kr.	Excess of Imports: Mill. kr.
1912	818	682	136
1913	855	721	134
1914	795	867	72
1915	1,157	1,120	28
1916	1,357	1,309	48
1917	1,082	1,065	17
1918	945	743	202
1919	2,519	909	1,610
1920	3,142	1,814	1,328

Thus it appears that the excess of imports over exports was in the years preceding the war about 130,000,000 kr., while in the first four war-years export and import were almost equal. Yet in 1914, on account of "hidden exports," the trade balance was actually favourable. In 1918 the balance was 200,000,000 kr., and in 1919 and 1920 it averaged 1,500 million kr. against Denmark. In the years 1914–8 the position was favourable, partly owing to the consumption of stocks and the selling-out of assets, such as the stock of domestic animals, and partly owing to the profits of shipping. It is only natural that the commercial and therefore the financial balance after the war should present a somewhat different aspect. Also it must be borne in mind that some of the war-time profits were invested in extensive purchases in order to replenish the empty warehouses; also considerable contracts were made with a view to subsequent exportation to the Baltic states, a possibility which, however, had not been realized in 1921, and involved many individual concerns in heavy losses. A comparison of the value of Danish imports for home consumption in 1913 and 1918, the last of the war years, is as follows:—

Imports.

	1913		1918	
	Mill. kr	Per cent.	Mill. kr.	Per cent.
Raw material for agriculture .	170	23	33	4
Raw material, etc., for industry	130	16	183	20
Partly manufactured articles .	48	6	130	14
Articles of food or luxury .	148	19	56	6
Fuel and illuminants . . .	81	10	299	33
Articles of industry . . .	200	26	209	23
Entire import for home consumption	777	100	910	100

The figures show the remarkable changes in the relative values of different imports arising in consequence of the war, but the varying advance in prices must also be taken into account, and the corresponding changes in quantities imported are not indicated. As for fuel, the yearly import before the war was about 3,000,000 tons, while during the war it fell below 2½ million.

A comparison of the exports during the normal year 1913 with the war-year 1918 gives the following:—

Exports.

	1913		1918	
	Quantity: Mill. kgm	Value: Mill. kr.	Quantity: Mill. kgm	Value. Mill. kr
Butter	91	200	15	113
Pork	135	164	3	8
Eggs	454	33	328	68
Horses (number) . .	28,000	21	29,000	75
Cattle (number) . .	152,000	48	114,000	70
Meat	15	14	14	39
Other agricultural products	—	71	—	150
Total		551		523
Fish		12		17
Articles manufactured .		74		170
Total		637		710

The chief articles of export were the more or less manufactured agricultural products. But between 1913 and 1918 this export was so much reduced that, notwithstanding the great advance in prices, the total value declined. After the Armistice the export of farm products increased. The value of manufactured products and eggs exported was in 1920 about 920 million kr. and of live animals about 110 million kr. The butter export rose in 1920 to 75,000,000 kgm. and the pork export to 45,000,000 kilogrammes. The trade with foreign countries in 1913, 1917 and 1918 was as follows:—

Country	Imports			Exports		
	1913 per cent.	1917 per cent.	1918 per cent	1913 Home manufactured articles: per cent	1917 Home manufactured articles per cent	1918 Home manufactured articles: per cent
United Kingdom .	16	26	21	63	27	7
Germany .	38	22	33	25	50	43
Sweden . . .	8	13	25	2	9	23
Russia . . .	9	1	--	2	1	1
United States .	10	20	4	1	—	--
Norway . . .	1	3	5	2	6	16
Other Countries	18	15	12	5	7	10

The export of home-made articles to the United Kingdom in 1913 was 398 million kr., of which butter (180 million kr.), pork (160 million kr.) and eggs (31 million kr.) made up 371 million kr., or more than 90% of the total. Exports to Germany were in 1913 valued at 159,000,000 kr., cattle and meat 65,000,000 kr., and hides 10,000,000 kroner. Before the war Denmark did most of its business with England and Germany, but during the war much business was done with the Scandinavian countries, especially with Sweden. A considerable part of the foreign trade in war-time was conducted by agreements between the countries concerned as to desirable interchanges of supplies. After the war foreign trade partly returned to pre-war lines. The import and export of raw materials and agricultural produce is largely conducted through the farmers' own coöperative organizations. During the war only a limited quantity of goods was admitted from England and America. Agreements to that effect were made with the United Kingdom in Nov. 1915 and with the United States in Sept. 1918, negotiations being conducted between the respective Governments and the Danish commercial and industrial organizations, "Grosserersocietets Komitë" and "Industriraadet." These organizations also distributed the imported quantities among such Danish firms as had hitherto been importing or using the articles in question. The export of agricultural produce is mainly conducted through Esbjerg or Copenhagen. Copenhagen is by far the most important commercial city. A part of the retail trade is in the hands of the peasants' own coöperative societies.

Economic Legislation During the War.—Immediately upon the outbreak of the war, on Aug. 7 1914, the Government was authorized to take measures to ensure supplies and to prevent an unfair rise in prices. A special committee was appointed for the regulation of prices and supply of necessaries of life and of other articles, and export was either prohibited or required a licence. For such articles as butter, pork, etc., the object of control was not merely to ensure the supply of the home market but quite as much the control and regulation of the export trade.

The special committee commenced immediately to forbid the use of rye and wheat for forage. Till that time home-grown grain had been largely used for feeding swine, horses, etc., bread being baked from imported corn, the supply of which completely ceased. In the winter of 1916 the use of sugar and in 1917 of potatoes for forage was prohibited. Licences for potatoes were, however, always granted when supplies for human requirements were sufficient. Maximum prices for home-grown rye and wheat were fixed about Christmas 1914. In May 1915 maximum prices followed for swine and pork. By order in council of Nov. 27 1916 it was notified that any advance in the prices of food decided on by mercantile unions or firms holding monopolies must be notified to and sanctioned by the special committee. On Jan. 31 1917 maximum prices were fixed for potatoes. Sugar production and prices were also placed under observation and control.

Thus Denmark had the distribution of commodities and maximum prices, especially of farm produce of importance to the home market, well under control before the blockade in its severest form took effect. Immediately upon the beginning of the blockade a general decree made it punishable for commerce to raise the percentage of profits above the level of 1914. On May 19 1917 orders were issued to prevent the enhancement of prices of commodities as a result of their having passed through more hands than necessary and customary (the so-called "chain-commerce"). The existing maximum prices were retained and new ones were fixed for a constantly increasing number of commodities. In the spring of 1916 the State had already taken possession of the corn harvest, but at the beginning of the blockade it took the sole control of the trade through the Board of Food Control, established in 1917. Before Feb. 1 1917 only sugar had been rationed but had not been materially reduced, home production almost equalling consumption. Grain was rationed in the spring of 1917 and pork in the autumn of 1917. Owing to the increasing scarcity similar measures were taken later with regard to butter, margarine, fuels, illuminants, benzine, coffee, tea, rice and other articles. The scarcity of fats made it necessary to introduce special regulations for the soap industry. At the same time maximum prices were fixed for the articles in question. Several other branches of industry were also put under control. After the war, imports having gradually reached their former level, these rules and regulations were discarded. In the spring of 1921 only a very few were left, such as regulations and maximum prices for bread and sugar and certain regulations of the beer and spirit industries. To ensure thorough economy in the production of spirits the respective concerns formed a combine. These measures for controlling prices were taken after consultation with the different trades.

Taxation and Public Finance.—The former basis of taxation of landed property in Denmark was the assessment of *Hartkorn* which was based on the quality of the land and had remained unaltered since 1844. For other property there was a variety of taxes of old standing. A law of 1903 introduced a new general assessment of all estates and property. Land rent was based on periodical valuations ("selling value"). A general income and property tax of a progressive per-cent. rate increasing in amount almost every year, and at the same time made more progressive, was introduced in the same year. The indirect taxes are the customs duties and the inland taxation of industry and trade. The tariff of 1863 was moderate but became heavier than was intended because of falling prices; and in 1908 it was revised, all necessaries of life, raw materials and agricultural produce being relieved of duty; protective duties were made small and duties on tobacco and spirits relatively high. Objects of taxation giving the best return are beer, spirits, tobacco and sugar. In the financial year 1913-4 the revenues of the Danish State amounted to 124 million kroner. Of these 101 million kr. were raised by taxation, 28 million kr. by direct and 73 million kr. by indirect taxes. The war occasioned an increase of taxation, and at the same time a change from indirect to direct taxation was effected. The State revenues of the financial year 1919-20 were 601 million kr., of which 575 million were from taxes, 347 million kr. direct, 248 million kr. indirect. Yet the main part, 235 million kr., of the direct taxes were extraordinary taxes. The national debt was in 1914 361 million kr. and in 1920 925 million kroner. The debt of all the municipalities was in 1914 375 million kr. and in 1920 750 million kroner. It must, however, be borne in mind that the value of State and municipal assets had proportionately increased.

Money and Banking.—Before 1908 the right of the National Bank to issue bank-notes was based on the same system as the Bank of England, but in that year the quota system was adopted. By legislation of 1915 the bank is required to be in possession of gold to the amount of one-third of the notes in circulation, and for the

remaining part there must be security in assets easily cashed according to special rules. The amount circulating in notes in 1900 was about 100, and just before the war about 150 million kroner. In the middle of 1917 it was 365 million kr., in 1919 541 million kroner. In 1914 the duty of the National Bank to redeem its notes with gold was temporarily suspended and it had not been reimposed in 1921. The other big banks of Denmark are the Danske Landmandsbank, with a stock capital of 100 million kr. and a balance at the end of 1919 of 1,421 million kr. (of which more than one-quarter is put under the ample heading: "Sundry Debtors"); Privatbanken, stock capital 60 million, balance 594 million; Köbenhavns Handelsbank, 50 million, balance 672 million; Kobenhavns Diskonto og Revisionsbank, 48 million, balance 452 million kroner. In connexion with the farming import and export organizations a cooperative banking institute, the Danske Andelsbank, was established in 1914 with a guarantee fund of 11 million kr. paid in. There are also several smaller banks, but in recent years many provincial banks have been absorbed by the big banks.

Prices.—According to an average calculation wholesale prices—if the immediately pre-war index figure is put at 100—rose to 249 by July 1917. The upward tendency continued until the maximum was reached in Nov. 1920 with the figure 430. The general tendency afterwards was downwards, the figure for April 1920 being 270. The advance in the retail prices of necessaries of life is illustrated by figures calculated on the basis of household budgets for families belonging to the working classes. The expenses of such a family just before the war being put at 100, the index figure rose constantly till it reached 265 at the close of 1920. The value of the Danish krone was very unsteady during the war compared to other values. In the post-war years the £ and $ rates declined—the minimum was reached in Nov. 1918, £1 equalling 13 kr. and $1, 2.80 kroner. The exchanges were afterwards reversed, the maximum being reached in Sept. 1920, when £1 equaled 25.68 kr. and $1, 7.40 kroner. In April 1921 £1 equalled about 21.50 kr. and $1 about 5.50 kroner.

Finance.—About 1910 the yearly revenue of the Danish State was estimated on the basis of the assessment for income tax, at about 1,200,000,000 kroner. In the war period this showed a constant increase, 1917-8 disclosing a yearly revenue of 2,600 million kr. and 1918-20 of over 3,300 million kroner. Thus since the war the yearly revenue has been multiplied by 2½, *i.e.* in almost the same ratio as the retail price index. The incidence of incomes is more equal in Denmark than in many other states, though here as elsewhere the contrast between rich and poor was to some degree sharpened during the war. In 1915 about 70% of the adult population (married women excepted) had incomes of less than 1,000 kr., making together some 30% of the total income; about 29% had incomes of between 1,000 and 10,000 kr., 48% of the total incomes; and nearly 1% had incomes of more than 10,000 kr., about 22% of the total incomes. While in 1908 three-quarters of the adult population (again with the exception of married women) had incomes of less than 1,000 kr., in 1918 only half the population were below that amount. The national wealth before the war was estimated at 10 milliards, and in 1921 had probably doubled (the assessed property had risen from 5,000 to 10,000 million kroner). While in 1908 about 92% of the adults possessed property of less than 10,000 kr., the corresponding figure for 1918 was only 87%.

The value of the shares represented on the stock exchange was in 1912 about 800 million kr., the quotation of the same shares was in 1918 about 3,000 million, in 1919 2,000 million and in 1921 probably 1,000 million. The difference of 2,000 million kr., forwards and again backwards, may represent individual gains and losses, to some extent made and suffered by the same persons. (F. G.-T.)

Labour.—In the 'seventies and 'eighties of the 19th century, the era of modern industrial development, an impetus was given to the trade-union movement, closely connected with the Social Democratic party. Both employers and employed are very strongly organized, chiefly under the two main organizations, the Combined Trade Unions and Danish Employers' Organization. The trade unions included in 1919 nearly 350,000 members, 277,000 belonging to the Combined Trade Unions. In 1910 Denmark was foremost in the movement, 51% of the workmen employed in industry, commerce and communications being organized. Since then the movement has made rapid progress. In most industries nearly all the workmen were in 1921 members of the organizations. There has also been a considerable inflow of agricultural labourers. The usual basis of classification of the unions is trades, not industries.

Besides the divisions for the different towns there are factory clubs and shop stewards; in some places a system by which chosen representatives exercise an influence over the general conditions of work has grown up in connexion with these clubs. In the summer of 1920 syndicalistic tendencies manifested themselves rather strongly, but in 1921 the movement largely died away.

The Employers' Organization, dating in its present centralized shape from 1898, exercises considerable authority over its members, by whom about 200,000 workmen are employed. After an extensive lockout in 1899 the two main organizations made the so-called "September agreement," deciding, for instance, that a positive majority is required for the declaration of strikes and lockouts, which must, moreover, be notified according to certain rules, and that all differences on the question of the interpretation of existing contracts and agreements must be referred to arbitration. After a conflict in 1910, on the proposition of the parties concerned, a law was passed adopting the system of conciliation in disputes and the establishment of a special court to decide questions of law. The average number of days lost in labour conflicts over a series of years was only one day a year for each workman, but in the unsettled state of the labour market in 1919-21 much higher figures were reached, chiefly owing to strikes in the Copenhagen building trades and among sailors and navvies. During the transport strikes of 1920 the activities of "Samfundshjaelpen," a voluntary civic organization for carrying out indispensable work left undone by the strikes, were of considerable importance.

The Employers' Organization attached great importance to the simultaneous expiration of the labour agreements of the different trades. This often resulted in joint negotiations for the renewal of agreements, in most cases accompanied by threats of extensive stoppages of work, which had, however, until 1921 always been averted at the last moment. In later years yearly agreements were made, adopting an automatic regulation of wages according to the price index of the Statistical Department from the middle of the period. A smaller part of the wages of State employees was also calculated according to this price index. Even before the war Danish industry suffered considerably from unemployment, which amounted to 10% in the period 1903-13. After the close of the war, conditions became still more complicated owing to the after-effects of the blockade and the critical state of affairs generally.

Wages in Denmark were somewhat high compared with other European countries. The average weekly wages for skilled labourers were: in 1897 20 kr.; 1905 25 kr.; and 1920 120 kr.; for unskilled labourers 16, 20 and 100 kroner. During the war wages rose continually, at first slower than prices, later somewhat faster, but in the spring of 1921 a general though not very important reduction of wages took place. Before the war about 20% or 25% of the workmen in industry were paid by the job. The wages of agricultural labourers were: in 1910 700 kr.; 1915 800 kr.; 1918 1,400 kr.; and in 1920—partly owing to the increasing organization—1,800 kroner. The position of Denmark in the matter of working hours has, as was the case in the matter of wages, been something between that of England and the rest of Europe. The average working hours of industry were in 1872 11·4; since then they have gradually decreased. Accordingly, when the eight-hour day was adopted on Jan. 1 1920 by voluntary agreement between the chief organizations, this was a step of comparatively small importance. Denmark joined the international agreement about the eight-hour day, but in May 1921 no law concerning this question had been passed.

At the close of the 19th century a general interest in social questions was greatly awakened. The year 1873 brought the first factory legislation, and in the beginning of the 'nineties came the general decisive acceptance of insurance relief legislation. The leading principle is voluntary State-aided insurance against illness and unemployment, and for the rest public relief, apart from accident insurance, which, as elsewhere, is paid by the employers. The poor law of 1891 not only regulates pauper administration proper but also lays down certain rules, which have been repeatedly extended, for State or parochial relief, directed through the ordinary pauper administration but without the usual unpleasant consequences to the recipients. Such aid is given in cases of a number of chronic diseases, insanity, epilepsy, tuberculosis, blindness and to deaf-and-dumb persons. Medical and obstetric aid is also given and extended aid to members of benefit clubs. Since 1907 every parish has had, besides the poor-rates, a relief fund—*Uhjaelpekasse*, with a board of its own, intended to administer relief in cases of urgent need. This fund has, however, in many cases become merely a more respectable form of pauper administration. By the Old-Age Pensions Act passed in 1891, Denmark took the lead in the question of providing for the aged. Certain conditions are laid down as to the need and worthiness of the recipients, and it is especially stipulated that persons who have for five years previously received parish relief are excluded. The age limit is 60 years. The amount of the pension, which is decided upon the merits of each separate case, should suffice for sustenance of life, and medical aid in case of illness is included. In 1919 the number of recipients was 74,000 and the expenditure amounted to 34 million kr., State and parishes contributing each one-half. Denmark has several voluntary benefit clubs, mostly locally organized, but State-aided and under State control, in accordance with the Benefit Club Act of 1892, amended in 1921. Notwithstanding the voluntary system 70% of the working classes and a large number of others of similar standing are members, the total number amounting to two hundred thousand. As children of the members below the age of 15 years are also entitled to the benefits, the full number makes about three-fifths of the population. The chief benefits are hospital treatment, medical aid and subsistence money not exceeding 6 kr. a day. The State aid is 3 kr. per member and one-quarter of the chief expenditure. A considerable economic advantage to the benefit clubs is the very low charges made by the public hospitals for treatment of the members. The clubs recognized by the State have limited self-government under control of the State inspector of benefit clubs.

By three decrees of 1921 persons suffering from chronic diseases were admitted to the sickness insurances without any extra charges;

an insurance against disablement, forming an obligatory supplement to the voluntary sickness insurance, was established; and special rules were laid down concerning "poor-relief without the effects of poor-relief," to be paid to a considerable part of the uninsured disabled. The first Accident Insurance Act relating to a number of dangerous industries and based on the principle of employers' liability was passed in 1898, and after some gradual improvements a general comprehensive Act was passed in 1916. It is the duty of the employer to have all persons employed insured in the private accident companies. For compensation a sum of money not exceeding 24,000 kr. is given. Special rates are paid to the sons of widows. As early as 1907 an Unemployment Insurance Act was passed. The unemployment funds are voluntary and are practically identified with the trade unions. During the critical years 1917–9 the ordinary State aid was very considerably raised, and large sums were distributed according to rules which were less strict than usual.

In 1918 the entire contribution of the State to social insurances and the various forms of relief was, apart from sums arising out of special war-time legislation, 17 million kroner. The municipalities contributed 39 million kr., while the contribution of the members of sickness and unemployment insurance societies was 12 million kr., and the employers paid for the accident insurance 6 million kr., altogether about 74 million kroner. While the social insurance system proper is generally considered satisfactory—though in the recent difficult years the administration of the unemployment funds has been the object of criticism—strong claims were advanced for a modification of the old-age pensions system, which should establish a right to fixed rates, and also for a thorough reorganization of the lower branches of social relief (the pauper administration and relief funds), the administration of which had become complicated and unpractical owing to their gradual development. Danish factory legislation is, notwithstanding its inauguration by the conservative but very far-seeing Ludvig Bramsen (in the 'nineties)—father of the Danish Employers' Liability Act—rather radical and thoroughgoing, and very ably and effectively administered. On the other hand, Denmark has no Wages Board or Minimum Wage system. (F. Z.)

Political History.—After the Cabinet of J. C. Christensen—the formation of which in 1905 had led to a split in the ranks of its supporters, the Left Reform party separating from the Radical Left party—had been forced by the Alberti catastrophe to retire, a new Cabinet was formed by Niels Neergaard, a distinguished historian, as leader of the Moderate Left, with the support of the Moderate and Left Reform party (Oct. 12 1908). The problem of defence became the most prominent under this Cabinet, as the defence commission, which had been working since 1902, now reported. The members of the commission had not reached unanimity. The Socialists proposed disarmament; the Radicals wished the military to be replaced by a naval and police guard; while the Right proposed a material increase of military forces. The Government and its supporters in the *Rigsdag* were divided on the question of Copenhagen's land defences, and only after great confusion—new elections had not brought clearness—did the old leader of the Left, Count Holstein-Ledreborg, who had been away from active politics for years, succeed, as premier of a new Cabinet, in carrying through a new arrangement. The army and navy were enlarged; Copenhagen's naval defences were strengthened; and the land defences were to be dismantled not later than March 31 1922.

No party had a majority in the *Folkething*, and the Holstein Ministry was forced to retire in favour of a new Cabinet, formed by the Radicals with C. Th. Zahle, a barrister, as premier. This Cabinet could depend on support from the Socialists in the *Rigsdag*, though without thus acquiring a majority in either of the Houses. Under these conditions the Government announced its intention of postponing the introduction of the Radical programme. With the support of the Right it was able to secure a majority in favour of a proposal to prosecute the two ex-ministers, J. C. Christensen and Sigurd Berg, before the State Parliamentary Court, the *Rigsret*, for neglect of their ministerial duties in regard to Alberti (Mr. Christensen was acquitted and Mr. Berg sentenced to a fine). As the Government proposed a democratic amendment of the constitution and met with opposition, the *Folkething* was dissolved, and at the elections of May 20 1910 the Left, which was still divided on the defence problem, won half the seats. The two moderate Left groups now united into one party, the Left, and one of the old Moderate leaders, Klaus Berntsen, a former teacher in the peasant high schools, formed the new Cabinet on July 5 1910.

King Frederick VIII. died on May 14 1912 and was succeeded on the throne by his son, Christian X.

With the support of the Radicals and the Socialists the Government again raised the constitution problem in 1912, but because of opposition in the Upper House (*Landsthing*), where the Right controlled about one-half of the seats, no solution had been reached when the ordinary elections were held in May 1913. At these the Radical and Socialist parties gained control of 63 out of the 114 seats in the *Folkething*; Zahle formed the new Radical Cabinet. The constitution problem immediately became prominent, and the constitutional parties decided to let nothing divide them because of the importance of the issue; under these conditions the Socialists voted for the budget for the first time. The Right raised the most decided opposition against this united democracy; powerless in the *Folkething*, they undertook, by a policy of obstruction in the *Landsthing*, to check the further development of the case. As an answer to this the Government dissolved the *Landsthing*. The election results were: 29 supporters and 25 opponents of the constitutional amendment. Of the 12 members nominated by the Crown 9 were on the side of democracy, hence the Government was certain of a solid majority.

The outbreak of the war temporarily hindered the final solution of the constitution problem. It was with great anxiety for the future of their country that the Danish people experienced the fateful days of Aug. 1914. On Aug. 1 the *Rigsdag* passed a number of laws which the extraordinary conditions made necessary. The mobilization of the emergency army, numbering in all about 70,000 men, began on the same day. All political parties agreed in maintaining the neutrality of Denmark. An attack by Germany was especially feared. A difficult situation arose on Aug. 5 in consequence of an inquiry from Germany as to whether the Danish Government intended to block Danish waters with mines, an inquiry which could only mean that if Denmark refused Germany would lay the mines. The Government was uncertain as to Denmark's responsibility as a neutral Power, and only after great hesitation was it decided to lay the mines. With this Germany was satisfied, and England sanctioned the action in view of Denmark's precarious position.

It became apparent that the war situation might have serious effects upon Denmark's economic life. Accordingly the *Rigsdag* on Aug. 7 authorized the Home Secretary to regulate prices and to confiscate all goods on giving full compensation. A Price-Regulating Committee was established to advise the minister. Further the Secretary of Justice was given power to prohibit exports. The Government exercised these powers several times during the following months to secure the supply of food grains and for other purposes. As in military affairs, the Government adhered to the policy of keeping the warring nations always informed of the measures adopted, and in this way succeeded in establishing, with both sides, confidence in Denmark's desire for real neutrality, and an understanding of the importance of maintaining effective industries. This in time resulted in fixed agreements with Germany and England as to exports.

When the first anxiety was allayed the constitution problem was again taken up. As the opposition of the Right was declining, a result was reached without great difficulty and June 5 1915 the King signed the new constitution. This introduced equal suffrage in the elections for both Houses, men and women being entitled to vote under identical conditions; the voting age was fixed at 35 years for the *Landsthing* and was lowered successively from 30 to 25 years for the *Folkething*. Of the 140 members of the *Folkething*, 93 are elected in individual districts, 27 in greater Copenhagen according to proportional representation, and 23 supplementary seats are divided among the parties that have received too few representatives at the other polls in proportion to their number of votes. The *Landsthing* has 72 members, of which 54 are indirectly and proportionally elected in the large districts, while 18 are elected by the retiring *Landsthing* according to the same principles. In the case of a constitutional amendment a referendum must take place, and 45% of the eligible voters must vote for it to give it validity. The constitution came into force on April 21 1918.

Other important legislative Acts of the first years of the war, which were passed unanimously, were the Reform of the Administration of Justice (April 11 1916), which separated the administrative and judicial systems, and introduced oral proceedings and publicity—with trial by jury in criminal and political cases—and the Accident Insurance law (July 6 1916), which made it the duty of all employers to insure their employees. The privileged suffrage in elections to the *Amtsraad* (county councils) was abolished with the consent of all parties.

In the late summer of 1916 the comparative quiet which had marked political life since 1914 was succeeded by a bitter struggle. The cause was the announcement by the Government that it had concluded a treaty with the United States ceding the Danish West Indies to that country for $25,000,000. Both in the *Rigsdag*, whose ratification was essential, and outside strong feeling was aroused against the sale. The Left proposed a postponement till after the war or, if an immediate decision was necessary, the holding of fresh elections under the new constitution. The only solution of the crisis seemed to be new elections, but the King implored the party leaders to avoid such a situation, which would be a danger to the country. The result was a compromise: the Cabinet was supplemented by representatives of each of the political parties (Th. Stanning, the Socialist member, being the first member of the working classes to become a minister), and the sale of the islands was to be decided by the *Rigsdag* after a plebiscite of the people. At the polls (Dec. 14 1916) 283,670 votes were cast in favour and 158,157 against, and shortly afterwards the *Rigsdag* ratified the cession.

A contest of like character, but not nearly so far-reaching or bitter, arose in connexion with the rearrangement of the relation of Iceland to Denmark. With increasing force, Iceland demanded political independence and integrity. Despite the opposition of the Conservatives, the support of the other three parties sufficed to pass an Act of Union (Nov. 1918), in which Denmark acknowledged the independence of Iceland. The King is joint ruler of both countries and Denmark directs Iceland's foreign policy. The Act of Union is valid till 1940.

From 1917 onwards the unrestricted submarine warfare, combined with the stricter measures of the Entente, caused increasing difficulties in the economic life of Denmark. The Government, for whose economic policy the Home Secretary, Ove Rode, was primarily responsible, made further efforts, by means of maximum prices, export prohibition, and also by the rationing of certain articles, to create tolerable conditions for the people. It sought to mitigate the effects of the increase in prices by an extensive policy of relief; both the State and the communes rendered direct aid to those without means; public officials received increased pay until their salaries had undergone a thorough revision; and the unemployed, whose number rose to 70,000 in the winter of 1918–9, were given extra support. Through an increase of the succession, income and personal property taxes, and the introduction among others of a tax on exchange business, the Government tried to cover these and the greatly increased military expenses. In the five years of the war 1914–9, the expenditures of the Government were 156, 185, 251, 369, 616 million kr. respectively (in all 1,577 million kr.), and the total revenue for all five years 1,343 million kroner. The deficit was covered by loans. While the indirect taxes 1913–4 amounted to 55% and the direct to 28% of the total revenue, the figures of 1918–9 were 21% and 62% respectively. A radical anti-militaristic Government had from 1914–9 spent more than 500 million kr. on defence—more than all the Conservative war ministers together from 1865–1901.

After the spring of 1918 the elections could no longer be postponed. At the elections for the *Folkething*, when women voted for the first time (68% voted to the men's 84%), 72 supporters of the Government were elected, 39 Socialists and 33 Radicals, receiving 263,000 and 196,000 votes respectively; and 68 opponents, 45 Left and 23 Conservatives, receiving 273,000 and 168,000 votes respectively. The *Landsthing* was constituted as follows: 17 Conservatives, 26 Left, 13 Radicals and 15 Socialists.

At the time of the Armistice the old problems were viewed differently and new questions arose. The troops were quickly demobilized, the special defence works were razed, and on March 17 1920 a law was passed abolishing the land defence and artillery of Copenhagen. In 1919 the special military administration of justice had ceased. The Government's economic policy, which had caused some dissatisfaction, but as a whole had been supported by all parties, became the object of very strong criticism, as the Opposition thought it time to abrogate the war-time legislation in this respect. Instead of improving, the economic conditions became worse: small exports, the falling value of the Danish krone both at home and abroad, and numerous strikes, partly caused by the syndicalistic agitation, characterized the industrial and economic situation until near the close of 1920.

The Allied victory affected Denmark chiefly through the prospects of a reunion with the Danish part of Slesvig. On the same day—Oct. 23 1918—as the deputy of North Slesvig, H. P. Hanssen-Nörremölle, raised the demand of a reunion with the mother country in the German *Reichstag*, the Danish *Rigsdag* unanimously passed a resolution "that no other change in Slesvig's present position than an adjustment according to the principles of nationality would harmonize with the wishes, feelings and interests of the Danish people." With reference to this and statements made by the leaders of the Danish population in North Slesvig, the Danish Government communicated its wishes to the Allies (Nov. 28 1918), so that, when the Peace Conference in Feb. 1919 reached the discussion of the Slesvig problem, a united Danish North Slesvig delegation was sent to Paris to present the Danish point of view: a plebiscite *en bloc* in North Slesvig (Zone 1), a community ballot in Central Slesvig and Flensburg (Zone 2), and voting rights to all those who were born in the voting districts. The Peace Treaty was presented to Germany on May 7. The fact that it contained a provision for a plebiscite in South Slesvig (Zone 3), and gave voting rights to natives of the districts without consideration of their present place of residence, caused considerable excitement in Denmark. This departure from the wishes of the Government and the *Rigsdag* was due to the influence of a small group of the Danish people who wished the Slesvig question to be solved from a legal and historic point of view. Representations to the Peace Conference by the Danish Government were successful in getting the article providing for a plebiscite in Zone 3 omitted from the Treaty.

On the coming into force of the Peace Treaty on Jan. 10 1920, an international commission, containing among others the ambassadors of England and France, Sir Charles Marling and M. Paul Claudel, took charge of the plebiscite district. The plebiscite in Zone 1 on Feb. 10 gave 75,431 (75%) votes for Denmark and 25,329 (25%) for Germany; even the doubtful Tönder Amt had a majority for Denmark of 50%. On March 14 Zone 2 gave 48,148 (79%) German and 13,029 (21%) Danish votes.

While the plebiscite results in Zone 1 satisfied Danish expectations, this was not the case with the results in Zone 2. In the last years before the war the Danish element had here been yielding in the national struggle, but there seemed to be plain evidence of a change of feeling, especially in Flensburg, during the agitation before the plebiscite. The disappointment over the result was great. The Zahle Ministry had for months been the object of the most vehement attacks, because of its cool attitude towards the national propaganda in Central Slesvig, and the assailants made it responsible for the poor result of the plebiscite. In certain circles it was still hoped to prevent the final union of Central Slesvig with Germany by the so-called "Internationalization" of Zone 2. A storm of indignation at the national attitude of the Government in connexion with its economic policy began in the weeks after the plebiscite. When the Government refused to order new elections, with reference to the necessity for a new electoral law, the King dismissed it. A Cabinet of non-politicians, formed by Liebe March 30 1920, took the responsibility for the King's action, which was regarded by the supporters of the dismissed Cabinet as unconstitutional, and had caused the threat of a general strike from the Socialists. During this "Easter crisis" Denmark was not, but may have looked as if it were, on

the verge of a revolution. The mediation of the city council of Copenhagen and others conciliated the Crown and the Socialists, and on April 5 a new Ministry, consisting chiefly of State officials, was appointed to formulate an electoral law and to order new elections. The new law was based on proportional representation in the county districts (*Amtskredse*), and the supplementary seats system was retained in a slightly altered form. At the *Folkething* elections (April 25 1920) the Left received 351,000 votes (49 seats), the Conservatives 201,000 (28), "Erhvervsparti" (trades party) 20,000 (4), against the Socialists' 300,000 (42), and the Radicals' 122,000 (17). Niels Neergaard formed the new Left Cabinet on May 5.

On July 7 1920 the international commission handed over the executive power in Zone 1, awarded to Denmark by the Allies, to the Danish Government. After the constitutional amendments necessitated by this expansion had been adopted, the *Folkething* elections were held on Sept. 21 1920. In these the people of North Slesvig took part, and the voting age was 25 years for the first time. The results were 412,000 votes cast for the Left (52 seats), 390,000 Socialists (48), 217,000 Conservatives (27), 147,000 Radicals (18), 27,000 "Erhvervsparti" (3), and 7,000 for the German candidates (1). The Left maintained the leadership, and the Neergaard Ministry continued.

The problems relating to the constitution and to defence, which formerly were of the greatest consequence, had during later years been thrown into the shade by social problems, and the political parties were in 1920–1 developing in an increasing degree as representing economical interests, and as attached to certain classes: thus the Left was supported by the farmers, the Radicals essentially by the small holders, the Socialists by the industrial labourers, and the Conservatives by the capitalists and the middle classes in the cities.

Literature.—Between 1910 and 1921 Danish literature lost by death several of its representatives already famous—Karl Gjellerup (1857–1919), Herman Bang (1857–1912), Peter Nansen (1861–1918), Vilhelm Bergsoe (1835–1911), Sophus Bauditz (1850–1915), Troels Frederick Lund (1840–1921), Edvard Holm (1833–1915) and A. Fredericia (1849–1912). In 1917 Henrik Pontoppidan (b. 1857), the novelist, was awarded the Nobel prize.

While the older generation was still productive, either on the old lines or, as in the case of Karl Gjellerup, taking up new themes (classical, ancient Gothic, Indian), a good many young authors came to the front. Niels Möller (b. 1859) and Ludvig Holstein (b. 1864), in their few but elaborate poems, represented the scepticism and dark views of the 'eighties; Vigo Stuckenberg (1863–1905) and his friend Sophus Clausen belong essentially to the aesthetic renaissance; and partially this may also be said of Sophus Michaelis (b. 1865) and Edvard Blaumüller (1851–1911), although they have some features in common with the younger generation. All these were mostly lyric poets, but Stuckenberg and Michaelis had also written powerful novels.

The foremost younger lyrical poets were Valdemar Rördam (b. 1872; *Selected Poems*, 1918) and Helge Rode (b. 1870). Thor Lange (1851–1915), as well as Rördam and Möller, made many excellent translations of English and foreign poems. To the same school belong L. C. Nielsen (b. 1871; *Cantatas, Children's Songs*); Kai Hoffmann (b. 1874; *The Town and the Sea*, 1902; *Selected Poems*, 1916); Olaf Hansen (b. 1870; *Selected Poems*, 1918; *Translations from Icelandic*); Thöger Larsen (b. 1875; *Selected Poems*, 1917); Axel Juel (b. 1883). Of a more pessimistic and satirical type is Harald Bergstedt (b. 1877; *Jack and Elsie*, 1916 —" *a modern Adam Homo* ").

Powerful novels were produced by Harald Kidde (1878–1918) and Johannes Buchholtz (b. 1882). Ever since the latter half of the 'nineties the provincial note had been strong in Danish literature, as represented by writers emanating from the farmhouses and workshops. Foremost stands Jakob Knudsen (1858–1917), son of a parson, and for a time himself a clergyman but descending from and in the closest contact with Jutland peasants, a novelist of extraordinary power, but without artistic refinement. From Jutland also came Jeppe Aakjaer (b. 1866), a peasant's son and a peasant himself; his masterpieces are short stories and lyrical poems, but he has also written novels and historical essays. Johannes V. Jensen (b. 1873, son of a Jutland veterinary surgeon) has shown himself a master in his treatment of the Danish language (*Prehistoric Novels*, 1909–10, translations from Frank Norris and Whitman). From Fünen there is the novelist Morten Korch; from Zealand, Thorkild Gravlund (b. 1879), partly novelist, partly folklorist; Knud Hjortö (b. 1869), a prolific novelist; and from Bornholm, Martin Andersen Nexö (b. 1869), who had given pathetic pictures of the proletarians' lives. H. Bergstedt has manifested a satirical vein of some consideration.

The outstanding name in archaeology has been Sophus Müller (b. 1846, director of the National Museum till 1921). Ludvig Wimmer (1839–1920) was supreme as a runologist (*Danish Runic Monuments*, 1895–1908). Folklore has had eminent representatives in H. F. Feilberg (b. 1831; *Jutlandic Dictionary, Danish Peasant Life*), in Evald Fang Kristensen (b. 1843) and in Axel Olrik (1864–1917; *Heroic Legends of Denmark;* in English 1919). Celebrated linguists are Kristoffer Nyrop (b. 1858; *Grammaire historique de la langue française* i.–iv.), and Otto Jespersen (b. 1860; *Progress in Language*, 1894; *Growth and Structure of the English Language*, 1905; *Modern English Grammar*, 1909–14). The domestic culture of Scandinavia about 1600 was depicted by Troels Frederick Lund (*Daily Life in Scandinavia*, i.–xiv.), while Danish and foreign literatures were treated by Vilhelm Andersen (b. 1864) and Valdemar Vedel (b. 1865).

DENTISTRY (*see* 8.50*).—The progress of dentistry in the decade 1910–20 was more rapid and more radical than in any previous period. The cause of this progress was the general advancement in knowledge due to the accumulation of data arising from scientific investigation and the application of the knowledge thus acquired to the prevention and treatment of disease. Until comparatively recent times the extent to which abnormal mouth and teeth conditions are responsible for derangements of health was imperfectly understood. The pioneer studies of W. D. Miller, of Berlin, especially as reported (1891) in a series of communications entitled *The Human Mouth as a Focus of Infection*, first called attention to the fact that the oral cavity is the habitat and breeding ground for a large group of micro-organisms, many of them possessing pathogenic character which under conditions of lowered resistance invade other parts of the organism and become the direct exciters of bodily disease. Miller also showed that the mouth is the common portal of entry for most of the disease-producing organisms that infect the human body, and further demonstrated that certain mouth bacteria, when injected into the circulation of a test animal, could pass through the blood stream or lymphatic system and establish metastatic foci of inflammatory action at points and in organs remote from the seat of inoculation. These early findings were afterwards confirmed by other investigators, more particularly by Sir Kenneth Goadby, of London. Recognition of the significance and far-reaching importance of the principles underlying these results of scientific research was only gradually accorded by the general body of the dental profession, and then merely as interesting facts without direct utility in dental practice.

In several communications on septic dentistry, notably in an address delivered in 1910 at the opening exercises of the annual session of the Medical school of McGill University, Montreal, Sir William Hunter, physician and lecturer to the Charing Cross hospital, London, criticised badly conceived and unskilfully executed dental restorative operations, especially in crown and bridge work and the treatment of pulpless teeth, which were performed without regard to surgical asepsis. In this connexion Hunter brought to bear clinical evidence to prove the soundness of his contention that operations so performed leave septic foci

* *These figures indicate the volume and page number of the previous article.*

that cause septicaemic conditions, as well as infections in remote parts of the body. Hunter's revelation impressed at once the dental and medical professions and his criticisms immediately bore fruit. The general use of the X-ray as a means for study of the apical region of tooth roots, the development and application of specialized bacteriological technique for determining in pulpless teeth the identity and character of the exciters of disease action and similarly those responsible for inflammatory lesions of the retentive structures of the teeth (commonly designated as *pyorrhea alveolaris*), all stimulated by the realization of the profound clinical importance of mouth infections as related to bodily health, quickly followed the communications of Hunter.

The total effect of this evidence, both clinical and scientific, upon the development of dentistry has been little short of revolutionary. From time immemorial it has been believed from empirical observation that an unclean and infected mouth cavity is a source of bodily ill health, and much direct evidence of a clinical character had accumulated to strengthen that belief, but the evidence now at hand has affirmatively established the facts by scientific demonstration. Until this development of knowledge concerning the systemic relationships of disorders of the teeth and their related structures and their bearing upon the bodily health, the major feature of dental interest, and that upon which the attention of the profession was concentrated, had been the development and perfection of manipulative procedure in restorative operations. The ingenuity expended and the excellence of the results attained had become the outstanding characteristics of dental practice; and the restoration by prosthetic or operative means of the masticatory mechanism damaged by partial or total loss of teeth had been its dominating ideal. There is now an enforced recognition in the professional as well as in the lay mind of the importance of the welfare of the tissues and organs of the mouth. In the dental profession the consequent changes of technical procedure and objectives have been fundamental. The ideal of mechanical perfection in the methods and appliances by which the dental surgeon restores the patient's power to masticate has come to be regarded as a remedial measure subservient to the larger ideal of normal mouth health.

Oral Hygiene in Schools.—One of the principal factors which extended and popularized this knowledge is the oral hygiene movement, an effort to demonstrate practically the fact that school children, relieved of the disabilities arising from infected mouths and diseased teeth which handicap normal development, will show improved physical and mental efficiency. What is known as the Cambridge experiment, inaugurated in 1907 by the late George Cunningham, of Cambridge, England, was perhaps the earliest practical test. The analogous work of Dr. Ernst Jessen, of Strassburg, resulted in the introduction of oral hygiene into the public schools of a number of towns in Germany. In the United States the oral hygiene movement took practical form in the test of its utility in the Marion school of Cleveland, O., in 1910, and in 1919 there was completed under conditions yielding accurate figures, a five years' test of applied mouth hygiene in the public schools of Bridgeport, under the direction of Dr. A. C. Fones. In this test 20,000 children of the first five school grades were under observation and treatment. The average number of carious cavities was found to be over 7% per child; 30% claimed that they brushed their teeth occasionally; 60% frankly stated that they did not use a tooth brush and 10% were found to have fistulas on the gums, showing outlets from abscesses from the roots of decayed teeth. Systematic application of oral hygiene, the intelligent and systematic use of the tooth brush, and the elimination of accretions, dental decay and suppurative conditions achieved striking improvement in general health and mental efficiency. With respect to general health the statistics of the Bridgeport board of health show that the most common fatal diseases among children in that locality were diphtheria, measles, and scarlet fever. The decrease in deaths from these sources after the introduction of oral hygiene in the public schools is shown by the following table, the figures for 1914 showing conditions before the test:—

	1914.	1918.
Diphtheria	36·6 %	18·7 %
Measles	20·0	4·1
Scarlet Fever	14·1	0·5

The improvement in mental efficiency is shown by the reduction in the percentage of retarded children. A retarded child as defined by the Bridgeport school board is one who is not less than two years older than the normal age for the school grade to which it should belong. The percentage of retarded children before and after the introduction of mouth hygiene in the Bridgeport schools is shown in the following table:—

Percentage of Retarded Children.

Grade.	Sept. 1912.	Nov. 1918.	Drop in retardation.
I.	16·5 %	8·1 %	51·0 %
II.	37·0	15·3	58·0
III.	53·0	24·7	53·0
IV.	59·5	31·7	47·0
V.	61·0	33·1	45·0
VI.	54·0	30·4	44·0
VII.	39·0	19·3	50·0
VIII.	27·0	12·5	54·0
Average.	40·0	20·1	50·0

Since retardation represents inability of the child to continue to advance with his class, it necessitates repetition of his grade work, and therefore becomes an economic question of serious importance to the ratepayer. The cost of reëducation in Bridgeport in 1912 was 42 % of the entire budget, and for 1918 only 17 %. Among the 20,000 children under observation in the schools of Bridgeport, it was found that 98% had various forms and degrees of malocclusion of the dentures, a condition now generally recognized as being associated with a symmetrical development of the bones of the face and the brain case. Many children with malocclusion owing to the arrested development of the facial and cranial bones suffer from impeded nasal respiration, and moreover develop adenoids and tonsillar hypertrophy, leading to infection with its systemic sequelae and the interferences with bodily nutrition incident to insufficient oxidation of the blood. Orthodontic treatment for the correction of malocclusion in children has come to be regarded as a therapeutic and prophylactic measure having an important health relation rather than as a mere cosmetic procedure for the relief of deformity. The foregoing facts furnish convincing evidence of the desirability of making oral hygiene available to children of school age as a feature of dental public health service on economic as well as humanitarian grounds and on the broader ground of national efficiency.

Work in Armies and Navies.—Analogous considerations resulted in the organization in various countries of army and navy dental service of the nation. From small beginnings upon a contract basis the U.S. army and navy Dental Corps rose to an allotment by law of one dental surgeon for each 1,000 of the army personnel, and before the close of the World War provision had been made to double that allotment and to supply adequate equipment for field and hospital service. Instead of contract service the corps was placed upon a commissioned basis with pay and allowances identical with those of the Medical Corps and rank within the corps through all grades up to and inclusive of colonel. After 1918 full provision was made by the U.S. Government for the dental care of its enlisted men and of those demobilized from service suffering from dental defects or disabilities since demobilization. This latter activity is assigned to the dental division of the public health service. Accurate statistics as to the development of army and navy dental service in forces of other nations are not yet available, but the proportion of dental surgeons to army personnel in 1917, as given by officials of the British Dental Association (*see* "Man Power and the Army Dental Service," *British Dental Journal*, Feb. 15 1918), for some forces was:- Canadian Expeditionary Force, one per 1,000 men; New Zealand Expeditionary Force, one per 2,500 men; Australian Expeditionary Force, one per 2,600 men. Satisfactory figures for the German army dental service are not obtainable, but according to Dr. Ernst Jessen, head of the dental work in Strassburg, quoted in the *German Dental Review*, there were 810 dental surgeons active in the field in 1915. France, during the World War, had at least 1,500 army dentists working in various parts of the lines as fixed units, in addition to the dental ambulances. The French army dental service furnished a striking example of the practical importance of army dental service in that during the latter part of the war, when the man power of France was seriously depleted, over 250,000 effectives were mustered into the French service as the result of efforts instituted by Dr. Georges Villain, of Paris, by which that number of men who had been previously rejected because of loss of teeth, but were otherwise physically sound, were subsequently fitted with artificial dentures and sent to the fighting line.

The British dental service in the World War was inadequate, owing to the limited number of qualified dental surgeons available and the unfortunate fact that of the 1,050 to 1,100 serving in the army and navy in various capacities about 300 were enlisted as combatants, and of those latter 50 were killed. (*See Report of Parliamentary Committee on the Relation of Military Service to Man Power.* D. F. Pennefather, Chairman.) Great Britain created by Royal Warrant, issued Jan. 4 1921, a military dental service, the Army Dental Corps, which is administered by the Director General, Army Medical Service. The Army Dental Corps is a joint service for the army and R.A.F., and is on a commission basis with rank through the grades inclusive of lieutenant and lieutenant-colonel. Experience during the war clearly demonstrated to all the belligerent nations the importance of dental service as a

means of mouth sanitation and the practical utility of the latter in maintaining the physical efficiency of the fighting personnel, with the result that definite and active work has been undertaken to extend these health benefits to civilian populations.

Undoubtedly the most notable example of comprehensive planning for the national extension of dentistry and oral hygiene as a factor of the public health service is that proposed in the *Interim Report on the Future Provision of Medical and Allied Services*, made to the British Ministry of Health by the Consultative Council on Medical and Allied Services, May 1920. This report recognizes oral hygiene and dental service as factors of public health and as proper subjects for control and development by the State. Oral hygiene comprehends much more than the correction of dental defects and oral infection due to neglect of the tooth brush; its aim is prophylactic as well as corrective. Corrective procedures such as the filling of cavities of decay, treatment of diseased roots, extraction of useless teeth, correction of irregularities in their position and prosthetic restoration of lost teeth or parts of teeth, merely arrest the progress of disease and mechanically restore damage already done. The entire energies and skill of the whole dental profession are totally inadequate to cope with more than a small fraction of the corrective work needed. To establish the habit of personal care of the mouth in school children is a field of activity that has developed the specially trained dental nurse or hygienist as an adjuvant to dental service, whose calling is now legalized in the principal states of the United States. The work of the dental nurse is limited to the surface treatment of teeth, in the removal of deposits and accretions thereon, the training of school children in the systematic use of the tooth brush and their education in the importance of mouth cleanliness. In addition to the physical benefits resulting from oral hygiene among school children there is also a manifest improvement in *moral*. A child who has learned to use the tooth brush exhibits increased self-respect, greater attention to bodily and mental cleanliness, closer compliance with school regulations and an awakened interest in attendance and studies. The close connexion between oral hygiene and better citizenship is no longer debatable, and the present trend is toward making dental and oral hygiene service in all civilized countries a public health measure.

The many head, face and jaw wounds during the World War created a new field for oral surgery and surgical prosthesis. For the successful treatment of these cases it became evident that surgical measures alone were insufficient, as the loss of tissue from gunshot wounds of the head and face, as well as the unsightly scars resulting from extensive lesions when surgically treated, left the patient in many instances with repulsive deformities. The resources of surgery and dentistry were called into cooperation. Plastic surgery, involving the transplantation of the soft tissues and of bone to supply missing parts, was developed to a degree previously unknown. The rebuilding of the face, including reconstruction of the nose, lips, cheeks, the orbicular region, etc., was accomplished with a perfection in many cases almost miraculous. In this work the aid of dental prosthetic technique was often necessary. The large and increasing number of casualties of the head, face and jaws resulting from trench warfare quickly developed the need for hospitals and specialized equipment devoted entirely to the treatment of this class of wounds. Of these centres of specialized surgical activity the foremost in importance and extent was Queen's hospital, Sidcup, Kent, England, a unit under British administration with sections for British, Canadian, New Zealand and Australian forces manned by personnel from the respective forces. Cooperation between the medical and dental staffs of the sections was organized with most satisfactory results. The American Ambulance hospital of Paris at Neuilly-sur-Seine, subsequently taken over as American Red Cross hospital No. 1., was an analogous centre of specialized head, face and jaw surgery in which similar cooperation was again successful. These experiences furnished convincing evidence of the need by each profession of a more intimate acquaintance with the work of the other. This need is recognized in the practice of adding a professional dental service to hospital staffs.

A general quickening of scientific research has followed. Bacteriological and histological investigation of dental and oral pathology by numerous investigators has not only added greatly to knowledge in this field, but brought about great improvement in dental and oral surgical technique. Notable progress has been made in the study of dental and oral infections and of physical irritations of nerve terminals in and about the teeth, in their relation to mental disorders and reflex neuroses, that cause disturbances of the special sense organs as well as spastic disorders of a local or general character. Attention has been directed to the endocrine relationships of the teeth and oral tissues, especially as to the probable connexion between the activities of the ductless gland system and the reactions of the salivary secretion, as well as to variations in the calcified structures of the teeth and their susceptibility or immunity to caries. Corresponding changes in the objectives as well as in the character, the content and extent of dental education have taken place in harmony with these developments. Practical teaching has tended toward a closer approximation to the fundamental ideals and methods of general medicine in so far as they represent the principles common to the whole science and art of healing. While the most conspicuous progress in dentistry during the decade 1910–20 has been in the direction of its vital and hygienic relations, its technical and engineering features have shown a similar development. Until this period the construction of artificial dentures for the prosthetic restoration of lost teeth was almost wholly an empirical procedure depending on the judgment, manual skill and good taste of the operator. Scientific studies of the engineering principles underlying the mechanism of the human masticatory function, initiated about 1890 by W. G. A. Bonwill, of Philadelphia, and since prosecuted by his numerous followers, have brought the knowledge of masticatory movements and of the relations of the teeth and their morsal surfaces thereto to a state of completeness that enables the prosthetist by the aid of mechanical articulating devices to reproduce in the artificial denture a mechanism with possibilities approximating, both functionally and artistically, those of natural dentures.

The work of Alfred Gysi, of Zurich, constitutes the most advanced achievement in this field. In close relation to the progress is the coordinate progress made in the artistic reproduction in porcelain of nature's forms and colouring, brought about mainly by the studies of J. L. Williams, of New York, and N. S. Essig, of Philadelphia.

In 1913 Charles H. Mayo, the distinguished surgeon of Rochester, Minn., expressed the opinion that the next great step in medical progress in the line of preventive medicine should come from the dental profession. A review of the progress since made would seem to indicate a reasonable prospect of the fulfilment of that prophecy.

(E. C. K.)

DEPEW, CHAUNCEY MITCHELL (1834–), American lawyer and politician (*see* 8.56), failed of reëlection as U.S. senator on the expiration of his term in 1911. In 1914 he favoured the repeal of the Panama Canal Tolls bill. He assailed pacifism and after the sinking of the "Lusitania" (1915) urged a strong stand against Germany. In 1918 he presented to Peekskill, N.Y., a bronze statue of himself, which was erected in Depew Park, a plot of land purchased from the Indians in the 17th century by an ancestor, François du Puy. In 1919 he added much adjoining land to this park.

He is the author of *Some Views on the Threshold of Fourscore* (1914), including speeches delivered 1912–14, and *Speeches and Literary Contributions at Fourscore and Four* (1918, articles and speeches composed 1916–18).

DERBY, EDWARD GEORGE VILLIERS STANLEY, 17TH EARL OF (1865–), English statesman (*see* 8.69), was in Jan. 1915 created a Knight of the Garter. In Oct. 1915 he became director of recruiting for the army, and as such was responsible for a new scheme for a final effort on behalf of voluntary service. A large number of recruits were obtained by Lord Derby's scheme, but as the numbers did not equal expectations the Military Service bill was introduced and carried in Jan. 1916. In Feb. 1916 Lord Derby became chairman of the naval and military air service joint committee, but resigned in April, becoming Under-Secretary of War in July. On the formation of Mr. Lloyd George's Government in Dec. 1916, he became Secretary of War, and in April 1918 was appointed British ambassador to France. He retired from the latter office in Nov. 1920.

DÉROULÈDE, PAUL (1846–1914), French author and politician (*see* 8.74), died at Mont-Boron, near Nice, Jan. 30 1914. In 1910 he had published a collection of his patriotic speeches, and a volume *La Ligue des Patriotes* containing further extracts from them appeared two years after his death.

DESCHANEL, PAUL EUGÈNE LOUIS (1856–), French statesman (*see* 8.91). During his absence from the presidential chair in the Chamber of Deputies after 1902, Deschanel carved out for himself a position of some political importance on the Committee of Foreign Affairs. He was president of this important committee when the Franco-German treaty of 1911, confirming the settlement of the Agadir incident, came before Parliament. He was reëlected deputy in 1910, and on May 23 1912 he was chosen to succeed M. Brisson in the presidency of the Chamber of Deputies. He was maintained in this office by subsequent ballots in 1913 and 1914. His presidency of the Chamber was marked by much oratory of a literary nature, and by considerable dexterity in the treatment of the rowdy elements of the extreme Right and the extreme Left. He aimed at being the impartial Liberal Republican. During the World War he played a great part as the national orator. There were, indeed, few occasions of sorrow or of thanksgiving which his eloquence did not either lighten or intensify. He delivered orations more frequently than he made speeches. Whether it was to hold Ger-

man infamy up to universal execration, to sing the splendours of the dead of France, to pay a glowing tribute to an ally's achievements, or to console the widow and the orphan and spur on the living fighter, he always had at his command the delicate, if somewhat artificial, style of speech of the great Latins, which combined both the structure of the artist and the feeling of a man. Speech did not give to him a sufficient outlet for his literary gifts. He was prolific as a writer in reviews such as the *Revue de Paris*, the *Revue Bleue*, *Revue Hebdomadaire* and the *Nouvelle Revue*. His books number *Figures de Femmes*, *Figures littéraires* (both 1889), and a tribute to his political godfather Gambetta. His talents as a littérateur were recognized by his election to the French Academy on May 18 1899. He married on Feb. 13 1901 Mdlle. Germaine Brice, and had three children.

It was a secret to none that M. Deschanel, throughout his long political life, nurtured one great ambition—he desired to become President of the republic. When in Jan. 1920 M. Poincaré's term of office came to an end, it was with some genuine reluctance that Clemenceau allowed himself to be put forward as a candidate in opposition to Deschanel. That reluctance was justified by results. In the preliminary party ballot Clemenceau was beaten, and withdrew his candidature. Deschanel was elected President of the republic by the National Assembly on Jan. 17 1920 by an overwhelming majority. His term of office opened brilliantly, but his health was unable to stand the strain of office. In May 1920, while on an official journey to Montargis, he fell unobserved from the presidential train, and though he found his way to a signalman's box, and suffered no worse consequences than a nervous breakdown, he was temporarily incapacitated. His condition subsequently became such that on Sept. 20 1920 he was obliged to resign his office, and to leave Rambouillet, where he had sought the quiet necessary for the restoration of his health. He then went into a private nursing home at Rueil where he sufficiently recovered to be able to stand successfully for the Senate in the elections at the beginning of 1921, though he no longer took an active part in public affairs. (G. A.)

D'ESPÉREY, LOUIS FRANCHET (1856–), French marshal, was born at Mostaganem, in Algeria, on May 25 1856, and was commissioned from St. Cyr to the infantry in 1876. As a junior officer he saw much service in N. Africa and Tongking. For a time he was aide-de-camp to Freycinet, then Minister of War and premier. He served also in the expedition to N. China in 1900, after which he commanded an infantry regiment at home. He became general of brigade in 1908 and general of division in 1912. For a time he commanded the troops in Morocco, but in 1913 he was appointed to the I. Corps at Lille. He commanded this corps in the V. Army during the battle of the Frontiers, and at Charleroi had the ungrateful task of protecting the right of Lanrezac's army during its deployment on the Sambre; brought up at last on to the battlefield to deliver a decisive counter-stroke, he was at the moment of attack withdrawn again to protect the right rear of the army, the force which had released him having failed to keep the line of the Meuse. In the difficulties of the retreat which followed it was the I. Corps and its commander which formed, according to Lanrezac's own testimony, the soundest element of the V. Army, and when that general was relieved of his command on the eve of the battle of the Marne, Franchet d'Espérey was his obvious successor.

Gen. Franchet d'Espérey commanded the V. Army during the battle of the Marne and the advance to the Aisne, and continued in command till the end of March 1916, when he was appointed to the eastern group of armies, in succession to Gen. Dubail. After holding this office for some eight months, he passed to the more active command of the northern group of armies, of which he was in charge throughout the campaign of 1917. In May 1918 he went to Salonika as commander-in-chief of the Allied armies in that theatre. His predecessor, Gen. Guillaumat, had worked out the main features of a general offensive on the Salonika front, and continued, in close coöperation with him, to support the claims and needs of such an offensive in the councils of the Allied High Command at Paris. Men and material were sent out in adequate numbers, and though Franchet d'Espérey, even with Guillaumat's assistance, was only able to obtain the decisive authorization to attack a few days before the scheduled date, his energy was equal to the task of hastening on the last stages of preparation and on Sept. 15 an offensive was launched that carried all before it. Bulgaria surrendered, and the pursuit was pushed with hardly a check into and through Old Serbia. After the final victory he remained in charge of the Allied forces in European Turkey and Balkan occupied territory, with headquarters in Constantinople. He was created a marshal of France early in 1921.

DÉTAILLE, JEAN BAPTISTE ÉDOUARD (1848–1912), French painter (*see* 8.110), died in Paris Dec. 24 1912.

DETROIT (*see* 8.113).—Commencing with the recovery from the industrial depression of 1907-8, the city of Detroit entered upon a period of growth almost without precedent among large cities. The area of the city in 1907 was 35·65 sq. m., but by the end of 1918 had increased to 83·58 sq. m. With reference to a portion of this area a peculiar condition existed. The villages of Hamtramck and Highland Park were originally outside territory into which the population and business of Detroit overflowed. By annexations in 1916 and 1917 their outer boundaries were brought two miles within the city limits, but they still retained their separate municipal administrations. Together they covered 4·83 square miles. The pop. of the city as estimated from the Water Board enumeration of families was in 1907 about 390,000. In 1910 the U.S. census record was 465,766. The census of 1920 gave a total of 1,088,853 within the city limits, distributed as follows: under Detroit municipal administration 993,739; village of Hamtramck 48,615; City of Highland Park 46,499. A canvass made late in 1920 by the various city agencies for Americanization indicated that about 70% of the population was either of foreign birth or foreign parentage. Polanders, Germans and Russians represented the largest numbers, though there were large accessions from south-eastern Europe. In a single automobile plant there were 34 nationalities represented. A canvass of the public schools taken in Dec. 1920 showed 55% of the pupils of American-born parentage, 50·5% being white and 4·5% coloured. In 45% of children of foreign-born parents Polish ranked first and Russian next. In the three years ending with 1920 a large amount of work was done by the Board of Commerce, the Board of Education, and leading manufacturers in teaching the English language and the elements of citizenship through public night schools and factory schools.

Manufacturing.—The extraordinary growth of the city was mainly a consequence of the expansion of its manufacturing industries. In 1904 the city was 12th in rank among the industrial centres of the country, with $91,038,000 in manufacturing capital, 60,150 industrial employees, and a product valued at $128,247,000. Five years later it was 6th in place, with a capital of $210,000,000, 103,287 employees and product of $252,992,000. In 1914 it was 4th, being surpassed only by New York, Chicago and Philadelphia, with a capital of $405,000,000, 141,188 employees and product valued at $569,000,000. In 1919 the number of employees had increased to 310,000 and the value of the product was estimated at $1,450,000,000. In the first half of 1920 industrial activity was at its height, and although there was a decline in the latter part of the year, the total value was estimated at a slight increase over the previous year. By far the most important of the manufacturing industries was the making of automobile parts and accessories and assembling of motor cars. The business began in Detroit in 1899, but was not classed by the Census Bureau as a separate industry till 1904, when it had $3,447,000 capital, employed 2,191 workers and had a product valued at $6,240,000. In 1909 the capital employed in the industry had increased to $28,928,000, the number of persons employed in office and factory 17,437, the number of cars produced 45,560 and the value of the product $59,536,000. The next year there was a great expansion of the industry, both through the organization of new companies and additions to old plants. With the exception of a slight set-back in 1914, the growth was continuous till the latter part of 1920. At its peak of production in that year there were 25 companies assembling motor cars and 140 whose sole or principal business was the making of automobile parts and accessories. Together they employed about 155,000 persons and put out 1,250,000 cars valued at over $1,000,000,000. The Ford Motor Co. alone had a maximum of 53,000 men on its pay rolls, Dodge Bros. 23,000; and the Packard Co. 17,000. The distribution of these products was world-wide, the portion set apart for export in 1920 amounting to $152,000,000. During the decade ending in 1920 there were numer-

ous other changes in Detroit's manufacturing industries. Freight-car building, which was the largest of all up to 1908, has been almost entirely discontinued. The carriage and furniture factories were for the most part changed to the making of automobile accessories, and clothing manufacture diminished. Meantime some of the metal industries increased enormously. The city in 1920 was either first or near the front in the following lines: aluminium castings, brass products, computing machines, druggists' preparations, soda ash and kindred alkalis, stoves and varnishes.

Transportation.—For the accommodation of the increasing traffic caused by this industrial expansion there were great enlargements by the transportation lines. The Michigan Central tunnelled Detroit river and built an immense new passenger station and office building. That road and the Grand Trunk and the Pere Marquette made great additions to their freight yards, stations and sidings, and the outer belt line was extended. The Pennsylvania lines were extended from Toledo to Detroit, with a belt line of their own round a portion of the city, and ample freight and passenger facilities. The Detroit, Toledo and Ironton, which was suffering for lack of funds and equipment, was purchased by the Henry Ford interests, with great improvement in its facilities for service as a coal road. In lake freight transportation 1916 was the maximum year. The number of passages by vessels through the Detroit river that year was 37,852, net registered tonnage 76,677,264, actual freight tonnage 100,907,279, estimated value of freight $1,069,617,157. There was also in 1919 and 1920 an astonishing development in motor-truck service. There were in 1920 about 20 established lines reaching out from the city in all directions, and covering distances as great as 50 m. or more. At the April election in 1920 by a vote of 89,285 to 51,093 the people approved of a plan for municipal construction and operation of street railway lines. It was intended for the present to supplement, but ultimately to absorb, the privately owned system. A short section was opened Feb. 1 1921.

Miscellaneous.—The manufacturing and population growth was accompanied by similar expansion in other lines. For example: assessed valuation, 1910, $377,335,980; 1920, $1,699,149,580; city tax levy, 1910, $6,837,686; 1920, $35,086,359; bank capital and surplus, 1910, $19,130,000; 1920, $58,343,500; bank deposits, 1910, $140,183,995; 1920, $503,944,735; bank clearings, 1910, $910,835,005; 1920, $6,100,313,803; building permits, 1910, 5,498, to cost $17,225,945; 1920, 19,412, to cost $77,737,365; post-office receipts, 1910, $2,133,647; 1920, $6,031,442; internal revenue receipts, 1910, $6,725,941; 1920, $304,184,392; imports, 1910, fiscal year, $13,763,200; 1920, $91,160,552; exports, 1910, $82,143,633; 1920, $339,844,490. Detroit's allotment of the four Liberty loans and the Victory loan was $233,977,172. The subscriptions actually made amounted to $299,794,150, from 785,176 subscribers. During 1917 and 1918 contracts for munitions and army supplies to the amount of about $900,000,000 were taken in Detroit. Of these nearly $300,000,000 worth were cancelled after the Armistice.

Administration.—Under a charter adopted by popular vote June 25 1918, the methods of municipal government were materially changed. In place of a Board of Education of one member from each ward, there was a Board of seven members, elected two or three at a time on a general ticket and holding office for six years. The old Board of Estimates, consisting of two members from each ward and five at large, was abolished, leaving appropriations and bond issues to be determined by the mayor and common council. The mayor's final judgment was conclusive upon all appropriation items, unless reversed by a vote of seven out of the nine aldermen. The old common council of two aldermen from each ward was displaced by a council of nine members all elected at one time on a general ticket. The mayor, city clerk and city treasurer were elected, but all other administrative officers and commissions were appointed by the mayor, without reference to the council, and were subject to dismissal by him without trial. Nominations, two for each office to be filled, were made at non-partisan primaries. Blanks for voting were also non-partisan, and the time of election was separated from that of the state and national contests. By special legislative enactment the police and recorders' courts were combined in one with seven judges, holding office for four years and having jurisdiction of all criminal and ordinance cases. The judges were all chosen at one time on a non-partisan ticket. (W. St.)

DE VALERA, EDWARD [Eamonn] (1882–), Irish republican leader, was born Oct. 14 1882, near Charleville, Co. Cork. His father, Vivian de Valera, was a Spaniard; his mother, whose maiden name was Kate Coll, came from near Bruree, Co. Limerick. He spent his childhood and boyhood among his mother's people, and was educated first at the national school and later at the Christian Brothers' school, Charleville. He then went to Blackrock College, Co. Dublin, where he gained a reputation both as a student and an athlete. Here he worked at Latin, Greek, French and English literature, and at his favourite subject, mathematics. He won a middle grade exhibition in 1899, and in 1900 one in the senior grade. Entering the Royal University in 1901, he won the next year a second class mathematical scholarship. He went as teacher to Rockwell College, and while there graduated with a pass B.A. degree in mathematical science in 1904, and proceeded to the B.Sc. degree in 1914. In 1910 he passed the examination for the diploma in education (teaching). For a time he worked at a thesis on quaternions for his M.A. degree, but he never presented it. He also attended lectures in mathematics at Trinity College, Dublin, where he unsuccessfully competed for a scholarship. Returning to Dublin, he taught mathematics, Latin, and French in the principal Roman Catholic colleges, including the old University College, St. Stephen's Green; Belvedere; Clonliffe; Dominican College, Eccles Street; Loreto College, St. Stephen's Green; and Carysfort Training College for teachers. He examined in mathematics for the Irish Intermediate Board of Education in 1912 and following years. He unsuccessfully attempted to become an inspector of national schools. He was very popular with his pupils. He also rapidly acquired a knowledge of Irish (Gaelic), and in 1914 he was able to read difficult bardic Irish poetry. He took charge of the Irish Summer College at Tawin founded by Casement.

On the foundation of the Irish Volunteers in 1913, he threw himself heart and soul into the new organization. Sinn Fein had turned to the use of violence in 1909, and to this organization De Valera belonged, though he assumed no leading share in it till the Easter rebellion of 1916. When Casement was captured he countersigned the order of Thomas MacDonagh on April 23, cancelling the inspection and manœuvres ordered for that day. When, nevertheless, the rebellion broke out De Valera was in the outer circle of Dublin held by the rebels, which ranged from Kingsend to Ballsbridge. He commanded the insurgents holding Boland's bakery, which was valuable in two ways: it assured the rebels of a supply of foodstuffs, and it offered a commanding position for rifle fire. Though there was heavy firing day and night in this district, there were not many casualties, as there was much cover for both sides. The real leaders of the rebellion were P. H. Pearse and J. Connolly. When an order from the former reached De Valera commanding him to surrender, he at first refused to believe that it was genuine. When he satisfied himself, on Sunday, April 30, he submitted and surrendered with the hundred men of his garrison. He was sentenced to death, but the sentence was commuted to penal servitude for life, and he was committed to Lewes prison, but was released in the general amnesty of June 15 1917. No conditions had been attached to the release of the prisoners, and De Valera himself openly ascribed this action of the Government not to generosity, but to fear. As the only surviving leader of the rebellion, he found at once that he had achieved importance in the eyes of the majority of the Roman Catholic Irish, who had meanwhile swung round violently in the direction of Sinn Fein. When the ex-prisoners left the boat at Kingstown De Valera marched at their head, and his entry into Dublin was a triumphal progress. His triumph was increased in the same month by his election for East Clare by a large majority, his opponent being P. Lynch, who had been the crown prosecutor and now stood as a Nationalist. The importance of this election rivalled that of the famous Clare election of 1828, when O'Connell stood. De Valera's sweeping victory gave an immense impetus to the Sinn Fein cause.

From this time until his re-arrest in the spring of the following year De Valera was the heart and soul of the Sinn Fein movement. A facile writer and speaker, both in English and Gaelic, he was a master of the type of unmeasured eloquence that appeals to the Irish temper, which is impatient of compromise. In Dublin, on the day after his election for Clare, while in the hall of the convention the representatives of the N. and S. were engaged in seeking a formula of union, in the street outside De Valera was telling a cheering crowd that "if Ulster barred the way, Ulster must be coerced." A similar violence characterized all his speeches. The Sinn Fein convention of Oct. 26–27 1917 elected him "President of the Irish Republic."

In the agitation, in the early part of 1918, against "conscription" De Valera took a leading part. But in May the discovery by the Government of another plot for a rising, to be combined with a German invasion, led to his re-arrest together

with some 150 other prominent Sinn Feiners. He was imprisoned at Lincoln, in England, but on Feb. 3 1919 he, with two other Irish prisoners, escaped and, ultimately, made his way to the United States. Here, working with the same restless energy as in Ireland, he was successful for a time in enlisting a large amount of public sympathy for the Sinn Fein cause, especially in Irish and German-American circles. He was received as " President " by the civic authorities of New York (under Mayor Hylan's Tammany administration) and in other cities where the Irish vote predominated, presented with their " freedom," and otherwise honoured. His attempt, however, to persuade the party conventions, assembled to nominate candidates for the presidency, into making the independence of Ireland a plank in their programmes, completely failed, and the Irish question was not mentioned in the programme of either party. With the election of Mr. Harding to the presidency, it became clear that De Valera's efforts to involve the United States in a quarrel with Great Britain about Ireland had broken down, and in the spring of 1921 he returned to Ireland, where in June and July negotiations were opened with him by the Government with a view to an Irish settlement (*see* IRELAND: *History*).

In 1910 De Valera was married to Miss Sinead Ni Fhlannagain, one of the most popular teachers and earnest workers of the Ard Craobh and Colimcille branches and of the Leinster College.

DEVENTER, SIR JACOB LOUIS VAN (1874–), S. African general, was born in the Orange Free State in 1874. A colonel on the permanent staff of the S. African Defence Force, Van Deventer served in the German S.-W. Africa campaign, 1914–5, where he had a distinguished record in active service. His real gifts as a general, however, were not fully appreciated till he went to German E. Africa, to fight in Gen. Smuts's campaign against the Germans there. So well did he acquit himself in that field that when Gen. Hoskins, who had succeeded Gen. Smuts in the chief command, ceased to hold that post in 1917, Van Deventer was appointed commander-in-chief of the Empire Military Forces in E. Africa. He was then a major-general, and was given the temporary rank of lieutenant-general on becoming commander-in-chief. Shortly afterwards he was created K.C.B., in recognition of distinguished services in the field. As commander-in-chief he showed the same qualities which had secured for him this high promotion and it was under his auspices that the campaign was brought to a successful end. Van Deventer left E. Africa at the end of 1918, sending a message of thanks to the administrator of Southern Rhodesia, in which he expressed his sincere thanks for the " unfailing coöperation of the Rhodesian troops, British and African, in the campaign."

DE VILLIERS, JOHN HENRY DE VILLIERS, BARON (1842–1914), first Chief Justice of the Union of South Africa, was born at Paarl, Cape Colony, in June 1842. Descended from the Huguenots who settled in that part of the Cape, he was educated at the South African College, Cape Town, and went to Utrecht and Berlin universities. In 1865 he was called to the bar by the Inner Temple, and in the same year returned to South Africa and began practice as an advocate of the Supreme Court of Cape Colony. His success was immediate. Entering Cape politics in 1866, he was elected a member of the House of Assembly, became attorney-general of the Colony in 1872, and two years later was appointed Chief Justice of the Cape. In that high office he speedily confounded critics of his appointment. The Roman-Dutch law of the Colony, admirable in its logic and symmetry, was ill-fitted to the complications of modern conditions, and it was the life-work of de Villiers to adapt it to these needs. This he did, with a conspicuous success which has secured for his name a place high on the roll of those great judges who have done the work of British civilization in many parts of the world. De Villiers was knighted in 1880, was created a K.C.M.G. a year later, and in 1910 was raised to the peerage on his assumption of the post of Chief Justice of the newly formed Union of South Africa. He died Sept. 2 1914.

In the work of moulding the instrument of union he had borne a great if not a decisive part. Throughout his career he had taken a constant interest in the politics of Cape Colony and of South Africa—an interest which had never degenerated into partisanship, which had throughout been inspired by a true and enlightened patriotism, which had never lacked the touch of courageous plain speech at the many moments of crisis through which his country had passed. Universal recognition of these outstanding qualities made the appointment of de Villiers as president of the National Convention inevitable, though it must be said that, as the work of the Convention drew towards completion, there were murmurs—and not without justification—that long years on the bench had done something to affect his natural aptitude for presiding over the deliberations of such a body. These criticisms, however well justified, should not detract from the greatness of his achievement, both as a judge and as a figure in the tortured public life of South Africa during the hazardous years of his career. As a judge he touched genius. Acute, unbiased, learned in the crabbed texts of Roman-Dutch law, he added to these gifts the art of keeping steadily in mind the practical needs of the life of his country as affected by his judgments. Equity rather than precedent was his mentor. With the bar his relations were those of a wise and revered adviser. During repeated visits to Great Britain he shared with known distinction in the work of the Judicial Committee of the Privy Council, and the value of his assistance to that body was recognized more than once in public by his colleagues.

DEVONPORT, HUDSON EWBANKE KEARLEY, 1ST VISCT. (1856–), English politician and man of business, was born at Uxbridge Sept. 1 1856, and educated at Cranleigh school. He entered the firm of Kearley & Tonge, tea merchants and shippers, of London and Calcutta, subsequently becoming senior partner. In 1892 he entered Parliament as Liberal member for Devonport, and from 1905 to 1909 was parliamentary secretary to the Board of Trade. In 1908 he was created a baronet, and in 1909 was elected chairman of the Port of London Authority, being prominent in this capacity during the strike of transport workers and lightermen at the London docks in 1912. In 1910 he was raised to the peerage. He was appointed first Food Controller in 1916, and in 1917 became secretary to the Sugar Commission, but had to retire owing to ill-health. The same year he was created a viscount.

DEWAR, SIR JAMES (1842–), British chemist and physicist (*see* 8.137), published (with G. D. Liveing) *Collected Papers on Spectroscopy* (1915). In 1916 he received the Copley medal of the Royal Society, and the Franklin medal of the Franklin Institute of Philadelphia in 1919.

DEWEY, GEORGE (1837–1917), American naval officer (*see* 8.139), died in Washington Jan. 16 1917, and three days later was buried in the Arlington National Cemetery. By special provision Admiral Dewey was never retired but continued in active service up to his death, for the last seven years being president of the General Board of the navy. To the last he continued to urge the building of large battleships, citing their superiority in the battle of Jutland in the World War. He published his *Autobiography* in 1913.

DIAZ, ARMANDO (1861–), Italian general, was born in Naples Dec. 6 1861. He entered the artillery and served in that branch and in various staff appointments, until his promotion to major, when he transferred to the infantry. He served in the Italo-Turkish War in command of a regiment and was wounded at Zanzur in Sept. 1912. In 1914 he was promoted to major-general, and, after commanding the Sienna Brigade for a short time, was transferred to the general staff. On Italy's entry into the World War he was attached to the supreme command as chief of the operations department. He held this post till June 1916, when he was promoted lieutenant-general and took command of the 49th Division, which in Nov. of that year distinguished itself by the capture of Volkovnjak, an important position on the northern rim of the Carso. He visited the French front in Jan. and Feb. 1917, and in June he was given special promotion and confirmed in command of the XXIII. Corps, which he had held temporarily from its formation two months previously. Under his direction in the following Aug. this corps won a considerable success between Korite and Selo, on the Carso.

In Nov. 1917, after the Caporetto disaster, Diaz succeeded Cadorna as chief of the general staff. He was confronted with a very serious situation, but he brought to bear upon it all the needful understanding and resolution. Under his direction the battle front was successfully reconstituted, and the work of reorganizing the Italian army was carried out. At the instigation, and under the close personal supervision, of Diaz much was done to improve conditions for the soldiers at the front and for their families at home. Under his command the double attack of Boroevich and Conrad was broken up at the battle of the Piave (June 1918) and the armies of the Dual Monarchy were destroyed by the battle of Vittorio Veneto (Oct.–Nov. 1918). For his services Diaz received the collar of the Annunziata, the highest Italian order. In Nov. 1919 he was nominated army general and retired from his position as chief of staff, and later, upon the reorganization of the army and Ministry of War, he was appointed vice-president of the Army Council. He also became a Senator and in 1919 he received the freedom of the City of London.

As a division and corps commander Diaz displayed high military qualities. His position as chief of the general staff was rendered delicate by the fact that the British and French divisions which were sent to Italy after Caporetto were not at first placed directly under his command and his personal qualities were specially adapted to render collaboration easy. Diaz has been criticized for excess of caution in delaying his final attack upon the Austro-Hungarian armies. It is possible, though by no means certain, that he might have attacked with success sooner. But an earlier victory might very well have been less complete, and anything less than complete victory would not have served the cause of Italy or of the Allies.

DIAZ, PORFIRIO (1830–1915), president of the republic of Mexico (*see* 8.172), died in Paris July 2 1915. In April 1910 he was elected president for the eighth time, but as the result of widespread opposition to what was regarded as a prolonged dictatorship, a revolution broke out the following Nov., headed by Francisco I. Madero. Because of his age the President could not head his army personally, and in May 1911 was forced to resign. With his family he went to Spain, and thereafter until his death lived in various European capitals.

DICEY, EDWARD (1832–1911), English writer (*see* 8.178), died in London July 7 1911.

DIERX, LÉON (1838–1912), French poet (*see* 8.210), died in Paris June 11 1912. His *Poésies Posthumes* appeared in 1913.

DIESEL, RUDOLF (1857–1913), German engineer, was the inventor of the Diesel oil-engine (*see* INTERNAL COMBUSTION ENGINES), the possibilities of which, however, had hardly been realized till after his untimely death. He fell overboard the Antwerp-Harwich mail steamer on Sept. 30 1913, and was drowned.

DIGGLE, JOHN WILLIAM (1847–1920), English divine, was born at Strawberry Hill, Pendleton, March 2 1847. He was educated at Manchester grammar school and Merton College, Oxford, where he graduated in 1870, being ordained in 1871. After many years of energetic work in various parishes he was in 1892 made examining-chaplain to the Bishop of Carlisle, Dr. Bardsley. Four years later he became archdeacon of Westmorland and canon residentiary of Carlisle. In 1897 he became rector of St. Martin's, Birmingham, in 1903 was made archdeacon of Birmingham, and in 1905 became Bishop of Carlisle, where his energy and industry brought him a great reputation. He died at Rose Castle, Carlisle, March 24 1920.

DIGGLE, JOSEPH ROBERT (1849–1917), English educationalist, was born in Lancs. May 12 1849. He was educated at Manchester grammar school and Wadham College, Oxford. He took orders, but resolved later to devote himself to public work. In 1879 he was elected for the Marylebone division to the London school board, on which he remained until 1897, being chairman from 1885 till 1894. Diggle was an active member of many committees for the betterment of the conditions of the working classes, and published *Pleas for Better Administration upon the London School Board* (1881 and 1885). He died at Oxford Jan. 16 1917.

DILKE, SIR CHARLES WENTWORTH, 2ND BART. (1843–1911), English statesman (*see* 8.271), died in London Jan. 26 1911, and was succeeded by his son, CHARLES WENTWORTH DILKE (1874–1918), who died in London Dec. 7 1918. The baronetcy went to Sir Fisher Wentworth Dilke (b. 1877), a cousin of the 3rd Bart.

DILLON, JOHN (1851–), Irish Nationalist politician (*see* 8.273). The Irish members endeavoured unsuccessfully to censure the conduct of the Speaker in regard to the suspension of Mr. Dillon on March 20 1902. He was prominent that year in Parliament in his attacks on the Government for the revival of the Crimes Act, and in the following year he helped forward Mr. Wyndham's Land Purchase Act. For several subsequent years he played a comparatively subordinate part both in Ireland and in Parliament; but in 1909 he appeared as a leading apologist of cattle-driving, telling the House of Commons that the grazing system in Ireland had become an abomination. He aided the parliamentary progress of the Home Rule bill mainly by a judicious silence. In the years before the World War he had been very critical both of the increased naval preparations, which he said were the result of a bogus naval scare, and of Sir Edward Grey's policy in Egypt and Morocco. But he followed his leader, Mr. Redmond, in urging Ireland to take her share in the war against Germany, and spoke at the meeting in the Dublin Mansion House on Sept. 25 1914, when the platform was occupied by the Lord Mayor, the Lord Lieutenant, Mr. Asquith (Prime Minister), the Chief Secretary, and Mr. Redmond. In Parliament, however, he showed himself opposed to compulsory service and the setting up of a Munitions department; and after the Dublin rebellion he said he was proud of the rebels, accused the Government of washing out the word Nationalist in a sea of blood, and declared that Sir John Maxwell's system of military rule had done more to spread disaffection in Ireland than all the organizers of Sinn Fein. He did not show himself very sympathetic or hopeful in regard to the various suggestions of Mr. Lloyd George for settling the Irish question. In July 1918, as Mr. Redmond's successor in the leadership of his party, he brought forward a motion that the Irish policy of the Government was inconsistent with the principles for which the Allies were carrying on the war, advised calling in President Wilson to settle the question, and bitterly denounced what he called the outrageous coercive system in force in Ireland. But the violence of his language did not save him from the vengeance of Sinn Fein who now dominated that country; he, along with almost the whole of the Constitutional Nationalist party, lost his seat at the general election of Dec. 1918.

DINANT, Belgium (*see* 8.274).—The town was almost completely destroyed at the beginning of the World War by German forces invading Belgium, who here endeavoured to force the passage of the Meuse, the left bank of which was held by the French. On Aug. 23 1914, the Germans rushed the town, and, on the pretext that the civil population had fired on them, they set fire to the town and shot numbers of the inhabitants *en masse*. In all 665 persons, or about one-tenth of the total pop., were massacred, among them being 71 women and 39 infants, many of the latter only a few weeks old. Of 1,653 houses only about 600 remained. A minute inquiry into the charge, held subsequently, completely established the innocence of the inhabitants. The rebuilding of the town was being actively pursued in 1921.

DINES, WILLIAM HENRY (1855–), English meteorologist, was born in 1855, the son of G. Dines, also a meteorologist. He was educated at Woodcote House school, Windlesham, and afterwards entered Corpus Christi College, Cambridge, where he obtained a first-class in the mathematical tripos in 1881. He afterwards carried out some investigations for the Royal Meteorological Society on the subject of wind forces, and in connexion with this work designed the Dines pressure-tube anemometer. In 1901 he commenced researches into the problems of the upper air, and designed or perfected several instruments for use with kites, as well as a form of the Hargreaves box-kite, which proved of great value. In 1905 he was appointed by the Meteorological Office director of experiments in connexion with the investigation

of the upper air, and in 1907 designed a meteorograph for use with balloons. He also produced, in conjunction with Dr. Napier Shaw, the microbarograph and a recording mercury barometer, as well as various other instruments. From 1901 to 1902 he was president of the Royal Meteorological Society and in 1905 was elected a fellow of the Royal Society. He was a member of the International Commission for Scientific Aeronautics, and became an hon. or corresponding member of various foreign scientific societies. He is the author of many important papers on the meteorology of the upper atmosphere which appeared in the *Transactions of the Royal Society*, the *Geophysical Memoirs of the Meteorological Office* and elsewhere.

DIPLOMACY (*see* 8.294).—The general effect of the World War on the principles and practice of diplomacy, defined as the science and art of conducting negotiations between sovereign states, has been very great, for better or for worse; but in general it may be said that the war did not give the initial impulse to, but merely greatly strengthened, forces which had been long at work modifying the traditions of diplomacy and adapting it to new social and political conditions.

Long before the war the gradual development of a sense of the community of interests among civilized nations, and of the public law which was the outcome of this sense, had raised diplomacy to a far higher plane than that which it had occupied in the 18th century. Before the war, too, the progress of democracy had produced great changes in diplomatic practice. Delicate negotiations were, indeed, still conducted in secret, as they always must be; but publicity had already become a recognized diplomatic weapon to be used on occasion, and ambassadors, though still accredited to courts and governments, were sometimes—notably in the case of the United States and Great Britain—selected for qualities likely to appeal to peoples. Already, too, democratic sentiment was demanding open diplomacy, with popular control, while a host of publicists had long been busy devising schemes for an international order which, were it possible to realize it, would revolutionize diplomacy by establishing among the nations—to use President Wilson's language—" not a balance of power, but a community of power; not organized rivalries, but an organized common peace."

General Effects of the War on Diplomatic Practice.—These tendencies received a fresh impetus from the outbreak of the war. This disaster was widely ascribed to the machinations of diplomatists, who were denounced as representing not peoples but a class, as in league with capitalists and munition manufacturers to stir up war, as fraudulent trustees of the nations' welfare, who in their pitiful game of international chicanery habitually used language " false-friendly, circumlocutory, and non-committal, full of duplicity and secret reserves " (*e.g.* J. A. Hobson, *Towards International Government*, pp. 67, 69). The cure for this was to be to sweep away the diplomatic tradition altogether; to replace the trained diplomatic service by men directly representing popular opinion; and to secure effective " democratic control " by giving the deciding voice in all international questions to legislative bodies. These remedies for an assumed evil had the support of many sociologists and of many democratic politicians, especially in countries where parliamentary action on treaties was already required. Extend the system of democratic control, they argued, and crown the international edifice with a legislative assembly representing collective humanity, and peace will be forever assured, since the " peoples " never want war. This solution of the international problem, which ignored the fundamental difficulties, seemed to receive support in the highest quarters when President Wilson put forward his " programme of the world's peace." The very first of the Fourteen Points condemned " secret diplomacy." In future there were to be " open covenants openly arrived at, after which there shall be no private international understandings of any kind, but diplomacy shall proceed always frankly and in the public view." A " general association of the nations " was to be formed, in place of the partial alliances of former times (Point XIV.), and peace was to be made secure " by the organized major force of mankind."

The incorporation of the Covenant of the League of Nations in the Peace Treaty was an effort to realize the President's ideal.[1] From the point of view of the present article its main interest lies in the fact that it set up permanent machinery for that " diplomacy by conference " to which the work of settlement after the war gave a powerful development. For the rest, it cannot be said that the history of diplomacy from the time of the Armistice onward revealed any striking change in the old methods. Indeed, in so far as the traditional methods were departed from, the change was sometimes for the worse. The sounding phrases which had heralded the Peace Conference had only—as President Wilson himself confessed—raised in the hearts of millions of people hopes which could not be realized; and the enforced departure of the victorious powers from the promises and professions which they had made in their time of trouble did not inspire admiration for the new diplomatic morality. Nor was the assertion of this morality in the great Treaty a happy one. The preambles of treaties of peace in earlier times had perhaps been tinged with hypocrisy, since it was customary to describe the peace to be concluded as " Christian, universal and perpetual "—which nobody believed to be the truth. But even this pretence had its use, since it at least placed on record an ideal. In addition to this, however, it was usual to state that there was to be " complete oblivion of the past," a treaty of peace being conceived as a settlement of all outstanding differences and as clearing the ground for an entirely fresh start in the relations of the contracting parties (Satow, ii., p. 180). Whatever may be said of the guilt of the German nation in respect of the origin and conduct of the war, as justifying a departure from this tradition, the fact that in the Treaty of Versailles it was departed from is momentous. For the first time a treaty of peace was made to contain a confession of guilt on the part of the vanquished party, a confession permanently humiliating to a whole people. The old diplomacy, which was wholly practical, would not have made the mistake of introducing into what was intended as the foundation of the permanent order of the world a full charge of political dynamite of this description. The Allied statesmen of a hundred years ago did not thus humiliate France, even after the fresh outburst of the Hundred Days, though they were equally persuaded of her guilt and public opinion clamoured for her humiliation and dismemberment. But they were trained diplomatists, able to look into a future in which France, regenerated if not repentant, would again become a useful member of the European body politic. They cared not a rap for public opinion.

In general it may be said that the Peace Treaty of 1919 was the work of politicians, not of diplomatists; and this fact marks a significant change in the practice of diplomacy. Before the war the conduct of international affairs was, in Europe at least, in the hands of the trained diplomatic body working in connexion with the various Foreign Offices; and this international business was conducted according to an elaborate code of rules, established by custom or by convention, which had been devised as the result of long experience, to ensure its smooth working. At the Conference of Paris diplomatists were present, but they played but a secondary part. This was perhaps inevitable in view of the passionate interest of the peoples in certain aspects of the settlement, which forced those responsible for it to combine the functions of diplomatist and demagogue. But it had an unfortunate repercussion on the professional diplomatic service, of which it lowered the prestige.

This was especially the case, perhaps, in Great Britain. Even before the war there had been a tendency to pass over the professional diplomatists in making appointments to important embassies, which were occasionally, though as yet exceptionally, given to eminent party politicians. It is the system which has always prevailed in the United States, sometimes with excellent results—as in the notable succession of ambassadors to the Court

[1] For Mr. Wilson's conception, see his address to the Senate, Jan. 22 1917. Compare Mr. Asquith at Ladybank, Feb. 1 1917:—" A real European partnership, based on the recognition of equal right, and established and enforced by a common will."

of St. James's—but more often perhaps with results less satisfactory. Whatever may be said for this system, however, there can be no doubt that its considerable extension by the British Government since the war has dealt a severe blow at the diplomatic service; for how can men be expected to serve a long and arduous apprenticeship to a profession when they realize that its great prizes are given to outsiders who have served no apprenticeship at all?

Less obviously harmful was the outcome of the attacks from democratic quarters on the system of recruiting the diplomatic service in England. The object of this system, which demanded of candidates for examination nomination by the Foreign Secretary on the recommendation of persons of position and proof of the possession of an income of £400 a year, was to ensure the manning of the service by gentlemen, that is to say by those who had "at least had the opportunity of mixing in society where good manners are to be expected." In this system certain modifications were made as the result of a report issued in 1914 by the Royal Commission on the Civil Service. One of its recommendations was that the diplomatic establishment of the Foreign Office and the diplomatic corps abroad should be amalgamated, up to and including the grades of assistant under-secretary of state and minister of the lowest grade. This involved the abolition of the property qualification, which did not apply to the Foreign Office; and it was recommended that, in place of this, members of the service employed abroad should receive a suitable foreign allowance. After the publication of the findings of the Commission the recommendation of the Foreign Secretary was made dependent on the report of a board of selection composed of members of the Foreign Office and of the diplomatic service. In this there was nothing revolutionary; and the effect of the putting in force of these recommendations has been to widen the area of selection for the service. The danger lies in the denunciation as undemocratic of any principle of selection other than by the strict result of written examination. But the qualities required for a diplomatist, as Sir Ernest Satow rightly points out, cannot be ascertained by means of a written examination, which only affords evidence of knowledge already acquired, but does not reveal the essential ingredients of character (ii., p. 183). The character required for an efficient diplomatist will always be that implied in the best sense of the word "gentleman," meaning a man honourable, well educated, of good address and manners, and able to hold his own without self-consciousness in any company.

The whole body of rules and conventions for the regularizing of international intercourse, which is known as International Law, is the work of diplomacy, and it is the work of diplomatists to apply them. It follows that to be efficient they must be trained, and it is folly to suggest that the place of the trained diplomatist can be taken by a popular representative without experience or technical equipment. As Mr. Denys P. Myers has pointed out, by far the greater mass of diplomatic work consists in giving particular application to rules already universally admitted, a matter straightforward enough, but demanding technical knowledge. The remaining portion of the work is disproportionately difficult, since it consists in adjusting disputes about matters to which the application of existing rules is doubtful, or to which they admittedly do not apply, or which stand beyond all rules as questions of high policy. In such debates the diplomatist is necessarily an advocate; his object is not justice, but the advantage of the country he represents; and therefore "the art of which Socrates spoke, of making the worser cause appear the better, is inherent in every negotiation" (Myers, p. 208). Certainly the attempt of President Wilson to set up a standard of Right as the "acid test" of all claims between nations has altered nothing in this, and can alter nothing so long as nations differ in their conceptions of what Right is. Diplomacy must continue to be, in this aspect of its activities, frank advocacy of particular interests, even though the dispute be heard before the high court of the League of Nations. But this advocacy has been subject to certain rules, and in the interests of peace—which it has been the main purpose of diplomacy to preserve—it has in course of time elaborated a highly technical phraseology of which the object has been to convey a plain meaning without being unpardonably offensive. This method may be "circumlocutory," but it is more calculated to keep the peace than democratic "plain-speaking." A peccant Government informed that such and such an act will be considered "unfriendly" will perfectly understand the threat conveyed, and it will be easier for it to yield than if the threat had been uttered in more unequivocal fashion. In short, the conventional forms used in diplomatic intercourse have a very practical use. In the words of the late Mr. E. C. Grenville-Murray, "they regulate the precise words of respect and courtesy necessary to be used on every occasion: they deprive argument of its heat and expostulation of its acrimony."[1]

Secret Diplomacy and Democratic Control.—In spite of President Wilson's denunciation of secret diplomacy, the negotiations before and after the Conference of Paris followed almost exactly the old practice. The organization of the conference itself was modelled closely on that of the Congress of Vienna in 1814. As at Vienna, all business of first-class importance was settled by the representatives of the Great Powers in secret conference, and the plenary sessions, to which alone the Press was admitted, were almost admittedly mere full-dress parades intended to produce an illusion of publicity. By a curious irony it was indeed President Wilson himself who was most violently attacked for neglecting the principle that diplomacy must always proceed in the public view. In the course of the long controversy between the President and the Foreign Relations Committee of the United States Senate about the Covenant of the League of Nations, which ended in the refusal to ratify the Treaty of Versailles, complaints were loud and reiterated that the Committee were kept completely in the dark as to the progress of the negotiations in Paris, although under the Constitution their treaty-making power was coördinate with that of the President. It was also urged against President Wilson that, in order to secure his sole control of foreign affairs, he had largely extended the custom of superseding, for the purpose of particular negotiations, the accredited agents of the United States—whose appointment was also subject to the advice and consent of the Senate—by personal agents of his own (Corwin, p. 64). The victory of the Senate over the President in the matter of the Treaty of Versailles was widely assumed to have settled in favour of the Senate's view the long controversy—it had raged intermittently since the days of Washington—about the powers of the President and the Senate respectively over the conduct of foreign affairs. President Harding, however, was hardly in office before he asserted as vigorously as any of his predecessors the sole right of the President to conduct negotiations. The right of the Senate to ask for papers has long been admitted, but the right of the President to refuse, in the public interest, to submit them seems equally clear (Corwin, p. 84 *seq.*).

The outcome of this controversy illustrates the fact that the war and the negotiations which followed have left the questions of secret diplomacy and of democratic control very much as they were before. So far as democratic control is concerned, wherever parliaments exist foreign relations come under their review, and can be controlled by their power of the purse; and it is their own fault if this control is not effective. "The ultimate misfortune of war," says Mr. Myers, "depends everywhere upon legislative financial support." But while control of broad policies is thus assured, there is no control of the processes of negotiation. It is, indeed, hard to see how such control could be attempted without creating a hundred difficulties and dangers for one which it would obviate. The point was admirably stated by Mr. Arthur Balfour in the House of Commons on March 19 1918, on a motion for a Standing Committee of Foreign Affairs:—

"I think the British world perfectly understands the broad ends for which British diplomacy works. . . . What is not simple, what is not plain, what is not easy, is the actual day-to-day carrying out of the negotiations by which these ends are to be attained. A Foreign Office and a diplomatic service are great instruments for preventing,

[1] *Embassies and Foreign Courts* (2nd ed., 1856).

as far as can be prevented, friction between states which are, or which ought to be, friendly. How is the task of peace-maker—because that is largely the task which falls to diplomatists and the Foreign Office which controls diplomatists—to be pursued if you are to shout your grievances from the house-top whenever they occur? The only result is that you embitter public feeling, that the differences between the two states suddenly attain a magnitude they ought never to be allowed to approach, that the newspapers of the two countries agitate themselves, that the parliaments of the two countries have their passions set on fire, and great crises arise, which may end, *have* ended sometimes, in international catastrophes."

Mirabeau had said much the same thing in the French National Assembly in 1790, and subsequent history bore out its wisdom. It was not the diplomatists but the oratorical heat of the Legislative Assembly that plunged Europe into the wars of the Revolution. It was not public opinion, but the wisdom of the diplomatists on either side, which saved Great Britain and the United States from a renewal of war during the critical years that succeeded the Peace of Ghent in 1814. Had Castlereagh listened to the outcry of the British press and Parliament, had James Monroe and John Quincy Adams listened to the outcry of the American press and Congress, there would have been no hundred years of peace between the two countries. Instances might be multiplied. The world remembers the wars which diplomacy has failed to avert; it has forgotten, or has never known of those—and they are many more—which diplomacy has averted by a conspiracy of silence.

Diplomacy by Conference.—The most striking development of diplomatic practice since the beginning of the World War has been the increasing practice of direct negotiations in conference between the heads of governments, or between the principal ministers of departments concerned in the subjects under discussion. The practice is, of course, not new. The similar circumstances of the great war against Napoleon had produced similar results in the long series of conferences from that of Châtillon early in 1814 to the Congress of Verona in 1822; and Castlereagh had at the outset commended the convenience of the system, which promised to endow the councils of the Powers " with the efficiency and almost the simplicity of a single State." The practice arose in both cases from the necessity of reaching swift decisions. It is clear, indeed, that the problems to be solved by the Allies during the war were too varied, too technical, and generally too urgent to be dealt with solely through the ordinary diplomatic channels. The practice of direct negotiation between the heads of governments was an obvious counsel of expediency, and began early in 1915 with the visit of M. Millerand to London. In Feb. of the same year there was a meeting of Finance Ministers in London; but the first meeting of the heads of the Allied Governments was that at Calais on July 6. On Nov. 17, at a conference in Paris, it was decided in principle to establish a permanent machinery for coordinating the efforts of the Allies; and on Jan. 19 1916, at a meeting of Mr. Asquith and M. Briand in London, rules for the establishment of an Allied Committee were approved by them. This plan was first applied at the great conference opened at Paris on March 26, at which the prime ministers of France, Italy, Belgium and Serbia were present, together with representatives of Japan, Russia and Portugal. It is unnecessary to give here a list of the further conferences that followed. The significant thing is—to quote Sir Maurice Hankey—that " in the forcing-house of war the governmental machinery of a veritable League of Nations had grown up, whereby the will of the Allied peoples to win could be put into effect " (p. 15). The system of diplomacy by conference thus revived reached its fullest development, of course, in the great Peace Conference at Paris; and in the League of Nations an attempt was made to give it a permanent organization.

In addition to the advantage of rapidity of decision arising from this system, the claim has been made for it that the statesmen ultimately responsible for the policy of their respective countries become personally well acquainted, and that the intimacy and even friendship which tend to develop out of these meetings make possible an interchange of confidences which would otherwise be impossible. This is, of course, perfectly true. It is also true that, in view of the closer interdependence of the nations and the vast complexity of their economic relations alone, the old system of diplomacy is no longer sufficient and that " diplomacy by conference has come to stay " (*id.*, p. 25). If this means that the conferences of experts on this or that matter of international interest are to continue, there is nothing to be said against it. If it means that periodical meetings of heads of governments are to be erected into a permanent system, the case is far more doubtful. It may be doubted whether the cause of peace will permanently gain by taking the conduct of all serious international negotiations out of the hands of trained diplomatists and putting them into those of politicians unversed in diplomatic technique and sensitive to every shifting current of public opinion. Certainly the unrestful world left by the Peace Conference gives evidence enough of the disastrous results of the sounding phrases which heads of governments had used with so much effect on public platforms. Nor is a rapid decision on matters of controversy by any means always a good thing. The world has often been saved from war by the diplomatic dragging out of negotiations until public excitement on either side has subsided. Finally, there is the objection to too frequent conferences urged by the British Government at the time of the Congress of Aix-la-Chapelle in 1818, which has not lost its validity. They tend, as Lord Bathurst put it, to " keep the mind of Europe afloat," by suggesting to discontented peoples that no settlement is final and that, the machinery for change being permanent in the conferences of the powers, a long and loud agitation will suffice to set it in motion. It may be that the conference system will—as the creators of the League of Nations maintain—provide a safety-valve for the expansive forces of nationalism; but there is a danger that it may operate in another way, by not allowing these forces to cool. The introduction of an organized legislative element into international relations is thus somewhat of an experiment, and no one can say confidently how it will work out. In any case, however, there will still be room for the old diplomacy in its quasi-legal function of applying the acknowledged public law, and in its trained ability to adjust differences lying beyond it.

Functions and Rights of Diplomatic Agents.—The new and far more complicated conditions under which the World War was fought naturally added fresh problems to those which the old writers on diplomacy had discussed, as to the activities proper to those representing the interests of their Prince at a foreign court. Such questions were raised during the war more especially by the activities of the diplomatic agents of the belligerent states accredited to neutral governments. The duty of these agents being to forward the interests of their own states, what limitations was it proper and necessary to observe in carrying out this object? In effect, the answer to this question was found, not in establishing new principles, but in applying old principles to new conditions. The old definition of the ambassador as " an honourable spy " certainly applied during the war. In all neutral countries it was the duty of diplomatic agents to collect information useful to their governments, and to act as centres for an active propaganda of their views and aims. In certain cases, *e.g.* Switzerland and Holland, neutral countries were made the bases of propaganda and espionage in enemy countries, and these activities were carried on more or less under the supervision of the ministers accredited to the neutral countries. So long as this propaganda did not pass certain bounds there was nothing in this that did violence to the traditional principles of diplomacy, though propaganda had never before been organized on so vast a scale. Nor was the organization of a spy system, centred in neutral countries, a violation of diplomatic propriety, since in this respect all the belligerent nations exercised equal rights.

It was otherwise when diplomatic privileges and immunities were used to cover indirect attacks on the enemy through neutral interests. The most outstanding instances of this arose from the efforts of the Central Powers to interrupt the supply of arms and ammunition to the Allies from the United States. In Sept. 1915 the interception of a letter from Dr. Dumba, Austro-Hungarian ambassador in Washington, to Count Burian proved that the Austrian embassy, with the approval of the German, was con-

templating financing strike movements on a large scale in the United States in order to hamper the manufacture of munitions. At the instance of the United States Government Dr. Dumba was recalled. Count Bernstorff had previously been forced to apologize for his want of diplomatic courtesy in publishing, without first submitting it to the American Government, a denunciation of the un-neutral conduct of that Government in permitting the export of munitions of war to the Allies. Even more serious, however, was the subsequent discovery (Oct.) that Captain Boy-Ed and Captain von Papen, the naval and military attachés to the German embassy, had been active in a plot to destroy American munition factories and American ships carrying munitions. Their subordinates, who were not covered by diplomatic immunity, were imprisoned; the two attachés were recalled at the instance of the United States Government. The same fate befell Count Luxburg, German minister in Buenos Aires, the author of the famous advice that ships carrying food from the Argentine to the Allies should be "spurlos versenkt" (sunk without leaving a trace). These notorious cases, characteristic of many others, involved no new statement of principle, for they were clearly condemned by the traditional standards of diplomacy. "The ambassador," Callières had written in the 18th century, "may suborn the Prince's subjects for the purpose of obtaining information, but not for the purpose of plotting against their master." Equally clear was the principle condemning the practice of the German diplomatists, especially in the United States, of plotting attacks on enemy states (*e.g.* Canada, Ireland) under cover of their immunities. This was an abuse of diplomatic privilege, since it injured the state in which the plots were hatched by imperilling its neutrality.

See Sir Ernest Satow, *A Guide to Diplomatic Practice* (2 vols., 1917); Denys P. Myers, "Notes on the Control of Foreign Relations," in part iii. of the *Recueil de Rapports* of the Organisation Centrale pour une Paix durable (The Hague, 1917), pp. 285–382, an invaluable study of the essential conditions under which diplomacy works; Edward S. Corwin, *The President's Control of Foreign Relations* (1917); Sir Maurice Hankey, *Diplomacy by Conference* (1921). In *Democracy and Diplomacy* (1915) Mr. Arthur Ponsonby, who was in the diplomatic service from 1894 to 1903, puts the case for "democratic control"; an appendix contains the findings of the Royal Commission. (W. A. P.)

DISARMAMENT CONFERENCE: *see* WASHINGTON CONFERENCE.

DIVORCE (*see* 8.334).—(I.) UNITED KINGDOM.—In the law of divorce administered in England and Wales there was no change between 1910 and 1921 except as to procedure by poor persons, and in Scotland and Ireland there was no change at all. But in England since 1910 the subject has become one of acute controversy, and there has also been a remarkable increase in the number of divorces granted. The report of the Royal Commission appointed in 1909 was not published till 1912. The appointment of the Commission, and the Majority Report advocating increased facilities for divorce, were both backed by an influential body of prominent persons outside the Commission itself. The inquiry was dominated throughout by the late Lord Gorell (formerly Sir Gorell Barnes) who had previously practised in and presided over the Divorce Court, and who held very strong views in favour of the extension both of the reasons and facilities for divorce in all classes of society. But the recommendations of the Majority Report have been strenuously opposed, especially in the Church of England, which has been practically unanimous in condemning the present system of divorce and opposing its extension.

Most of the recommendations of the Commission were, however, embodied in a bill which passed the House of Lords in 1920, but was abandoned in the House of Commons. A new bill was introduced in the House of Lords in 1921 by Lord Gorell, the son of the chairman of the Commission mentioned above. The bill is based on the recommendations in which all the members of the Commission were in accord. The Lord Chancellor has also presented a report embodying the reform of procedure so as to give easier divorce to the poorer classes.

The Commission took evidence from lawyers and officials to a much greater extent than from any other class, and much of the Majority Report was highly technical and official. The point of view of the ordinary man and woman is better represented by the Minority Report, published in 1912 in the same Blue Book (Cd. 6478). Women were represented on the Commission by Lady Frances Balfour and Mrs. H. J. Tennant—the latter of whom added a valuable separate memorandum to the Majority Report. The Minority Report agrees to certain changes in procedure intended to bring divorce within the means of labour and the poor middle-class, but strongly warns the public on the experience of France and America not to extend the reasons for divorce.

The recommendations of the Commission are given below, those embodied in the two bills presented being distinguished from those rejected or ignored. Following the report of the Commission, the scheme of bill No. 1 was to save expense by bringing the court locally to the home of the applicant. This was to be effected by rules giving power to certain selected county court judges to act as judges in divorce and other matrimonial causes. Each cause for divorce or nullity or judicial separation was available by this bill to either husband or wife so that it was intended that, *e.g.* adultery or desertion alone should in future enable a wife to obtain a divorce and vice versa, the sexes being treated on an absolute equality.

The causes for divorce included in No. 1 bill (1920) are (*a*) adultery, (*b*) desertion, (*c*) cruelty, (*d*) insanity continuous for five years and certified as incurable, (*e*) "incurable habitual drunkenness." Any one of these causes was to be sufficient. A cause rejected by the bill was imprisonment in lieu of commuted sentence of death. Causes rejected by the Commission were disease (except as below), unconquerable aversion, and mutual consent. In addition to the above the causes in the bill for which nullity of a marriage can be obtained are (*a*) physical incapacity, (*b*) unsound mind or epilepsy at the time of marriage or within six months after, (*c*) venereal disease communicable at the time of marriage, (*d*) pregnancy at the time of marriage caused by some person other than the husband. Permanent judicial separation is allowed in the (1920) bill on any ground available for divorce, and the court may in its discretion convert the decree for judicial separation into a decree nisi for divorce, unless the applicant prefers to have the application dismissed. These last provisions are as recommended by the Commission to meet the conscientious scruples of the vast majority of the Church of England as well as of Roman Catholics and others who object to any divorce which enables either party to remarry.

Besides the consideration of what should be the grounds for divorce in future, the commissioners were most anxious to bring "the benefits of the law" to the poor and to remove the complaint that divorce is still the privilege of the comparatively rich. This the majority recommended should be done by selecting some of the county court judges to go round and hold divorce courts locally. A step in this direction was taken in the Administration of Justice Act (Dec. 23) 1920, which provided for divorce cases being heard at Assizes. The right to a jury was retained.

The bill presented by Lord Gorell in 1921 makes adultery by either husband or wife sole cause for divorce, but a marriage can be made null and void for (*a*) incapacity or wilful refusal to consummate, (*b*) unsound mind or epilepsy under certain conditions, (*c*) venereal disease at the time of marriage or (*d*) pregnancy by some person other than the husband existing at the time of marriage. With regard to (*b*), (*c*), and (*d*) the applicant must prove that at the time of marriage he or she was ignorant of the fact alleged; proceedings must be taken within a year from marriage and marital intercourse must not have taken place after discovery of the fact alleged by the applicant. Connivance, condonation and collusion by the applicant bar his application and remain absolute defences as before. The Court is to have a discretion to override the following defences: adultery, cruelty, desertion, unreasonable delay, neglect or misconduct by the applicant. Judicial separation can be obtained for habitual drunkenness if the applicant has used all reasonable means to reform the defendant and has not caused or conduced to it by his own conduct. Presumption of death can be decreed by the Court in proper cases and in particular where defendant has not been known by the applicant to be living for seven years. Juries in matrimonial cases are abolished by the bill, as are damages against the co-respondent beyond the actual pecuniary loss sustained by the applicant, but the co-respondent may be ordered to pay the whole of the costs and to settle property or make payments to "the parties to the marriage or either of them or the children of the marriage" according to his or her ability. It is clearly intended to make women

liable as co-respondents. There are improved provisions as to the custody and maintenance of the children and for preventing the parties from getting rid of their property during the proceedings. A British subject domiciled in England or Wales but resident in any other British possession who has obtained a divorce there may apply to the High Court in England to register the decree as a decree nisi. The wife whose husband has deserted her or been deported and whose domicile was at the time of desertion or deportation in England or Wales shall be considered so domiciled for the purposes of matrimonial causes. In cases where the wife so domiciled has married a foreigner and the marriage has been declared null and void by the Court of the husband s domicile, the High Court may pronounce the marriage null notwithstanding that the marriage was valid according to the law of the place where it was celebrated. This is to meet the very hard cases of French and other laws. In France the want of the parents' consent makes an otherwise valid marriage which has taken place in England void, so that the English subject so married remained tied in England though unmarried in France. The rule that refusal to comply with a decree for restitution of conjugal rights is " desertion " it is proposed to abolish, but on the other hand refusal of marital intercourse without reasonable cause is to be deemed desertion, and if one party has in good faith requested the other to return to cohabitation the refusal so to do within "a reasonable time" is to be deemed desertion. Neither desertion nor cruelty without adultery was to be a good ground for divorce (see below). The bill further proposes to regulate separation and maintenance orders by Courts of Summary Jurisdiction to be granted for cruelty, habitual drunkenness, or venereal disease. The bill provides for the orders to last two years only unless converted into decrees for judicial separation in the High Court. The applicant who obtains one of these summary orders is to have police protection against the defendant, and maintenance is to be collected by a court official. An important proposal of the bill is to make it contempt of court to publish any report or pictorial representation of the matrimonial proceedings until the conclusion of the case, and to exclude the public but not the reporters in the discretion of the judge.

This bill was almost uncontroversial as originally introduced but the advocates of divorce insisted on desertion being made a sole ground, and the bill (May 1921) was so printed in the House of Commons. This produced a reaction and the increase of divorce cases in 1920–1 accentuated the differences of opinion.

The reasons for the recommendations of the Commission on other points also demand more notice. The most serious problem raised is the question of allowing adultery by the husband to be the sole ground for divorce. This was treated by the majority very superficially as a question of the equality of the two sexes before the law; but in reality it is a much more serious problem. The idea of divorce by mutual consent is rejected by the majority, not so much on principle as on the ground that there is no demand for it. But divorce by mutual consent is already *de facto* in existence, and if the husband's adultery is made a sole cause it will be greatly extended. This is a point on which, among those well acquainted with the facts, there is no great difference of opinion (*see* Minority Report p. 180: evidence Mr. Justice Bargrave Deane, p. 848). It has been recognized law in England for a generation past that refusal by the husband to obey a decree to return to his wife, coupled with proof of adultery, entitles the wife to an immediate divorce. It has therefore become the common practice, where both parties desire a divorce, for the husband to leave the wife, who writes him a letter asking him to return. He refuses. She brings her suit. An order is made on the husband to return in 14 days, which he disobeys. He lets the wife know where proof of adultery can be found and a divorce is the result. This is not " collusion " in law, but it is what the public mean by collusion, and the number of these cases was even in 1918 nearly as great as the whole number of divorces in 1857 and has been greater since. If there were any desire to decrease the number of divorces this should be stopped. But the 1921 bill on the contrary proposes following the Majority Report that the husband's adultery alone should be a sufficient ground for divorce. No wife will ever commit adultery in order to get a divorce; because her adultery, if acknowledged, makes her a social outcast; but there is no such ostracism of the husband. At present the husband is deterred from seeking a divorce if he is obliged to admit cruelty. Desertion for three years, as proposed in both the bills, is not quick enough to be any temptation to collusion. But there could be no doubt that if the husband's adultery alone is made a sufficient ground it would greatly increase the number of divorces.

The increase in number was already enormous, as will be seen by the figures given below, taken from the official " Civil Judicial Statistics " (Part II, up to 1919).

The average number of petitions of divorce (apart altogether from suits for nullity and judicial separations, as to which there was no increase) for the years 1885 to 1900 was:

	1885–90	1891–5	1896–1900
Petitions . . .	511	543	650
Decrees Nisi . . .	378	391	504
Restitution Orders	21	18	21

The number of petitions seems as important in considering the disturbance in married life as the number of divorces.

The annual number of cases between 1900 and 1919 was:—

	Petitions (Divorce)	Decrees Nisi	Decrees Absolute	Restitution Ordered
1901	750	601	477	30
1902	889	608	601	33
1903	825	614	606	31
1904	720	634	528	35
1905	752	623	604	45
1906	767	650	546	54
1907	734	598	644	49
1908	846	672	638	65
1909	787	685	694	72
1910	755	588	596	69
1911	859	655	530	90
1912	920	690	587	125
1913	998	870	577	135
1914	1,075	693	833	158
1915	1,143	1,060	668	136
1916	1,163	686	972	159
1917	1,423	946	683	159
1918	2,323	1,407	1,082	236
1919	5,085	2,610	1,629	310

It will be seen from the table that the number of petitions for divorce (apart from those for judicial separation) increased from 750 in 1901 to 2,323 in 1918, that is at a rate of over 224% in 18 years. An even larger number was shown in 1919 21. The population of England and Wales in the same years increased by regular increments from 32,612,022 in 1901 to 36,800,000 in 1919. The latter year is taken to avoid complication as to demobilization. The increase is a little over 12%, so that if the increase of population were the only cause the number of petitions would in 1918 have been about 840 instead of 2,323.

The rate of marriage is rather more variable. The number of marriages in England and Wales was:—

1901 259,400	1902 261,750	1903 261,103	1904 257,856	1905 260,742
1906 270,038	1907 276,421	1908 264,940	1909 260,544	1910 267,721
1911 274,943	1912 283,834	1913 286,583	1914 294,401	1915 360,885
1916 279,846	1917 258,853	1918 287,163	1919 369,411	

The years 1915 and 1919 were abnormal years, and in both the number of marriages was much higher than in any previous year. This is accounted for by mobilization in 1914 5 and demobilization in 1919. If the rate be taken on the figures 1901–19 the increase was only a little over 18%. The increase of petitions in 1913 is almost exactly at the same rate as the increase in marriages. But the rate of increase in petitions in 1919 was more than double the increase in the marriage rate. If the petitions continue to increase at the same rate for another 18 years there will be 5,152 of them in 1936. The proportion of petitions to marriages in 1901 was less than one-third of 1%. It was nearly two-thirds of 1% in 1919. The registrar-general of births, deaths and marriages in his Report for 1919 (Cmd. 1017) says " the number of divorces obtained in 1919 was about 50% greater than in 1918, which was itself the highest up to that date, and with the increase in divorces there has been a corresponding increase in the number of persons who on remarriage described themselves as divorced." He adds that the war is " largely responsible for the sudden increase of the last two years, but as the frequency of divorce as recorded in the table has been increasing for many years it can hardly be expected that the pre-war level will be restored.' The warning of the Minority Report is illustrated by these figures. In 1918 the number of divorce petitions exceeded the number in 1917 by 900, and in 1919 rose to a total of 4,317, or an increase of 1,994. Petitions by husbands have largely increased since 1910. Petitions by wives have fallen off since 1914. The figures as to " poor persons' " suits under the system initiated in 1914 show that nearly five-sixths of these cases were for divorce. There were no fewer than 10,108 applications in the five

years, of which, however, nearly half were refused. The total number of husbands' petitions in 1917 were 1,067 against 638 by wives. There were no children in 660 of these 1,705 cases. In 1918 the husbands' petitions rose to 1,837 and the wives' to 857 for all classes of cases. There were no children in 1,043 of these cases. The duration of these marriages is another interesting point. The marriages which had lasted over five years and less than twenty were 1,149 out of 1,705 in 1917 and 1,788 out of 2,688 in 1918.

Scotland.—In Scotland, after the Reformation, adultery was introduced as a cause for divorce without statute, apparently upon scriptural grounds, and as a consequence of the abolition of the pope's jurisdiction in Scotland. Prior to the Reformation, marriage had been looked upon in Scotland, as in other Roman Catholic countries, as a sacrament; after the Reformation it came to be regarded from the point of view of a contract, of a peculiarly solemn and far-reaching nature, but which might be dissolved consistently with public morality, and divorce for adultery was at once introduced. Wilful desertion was confirmed by statute in the year 1573 as a ground for divorce, four years being then fixed as the period for which the desertion must subsist, and that period has been maintained until the present day. From the evidence of Lord Salvesen (vol. I., p. 254) it appears that in 1908 110 decrees for divorce were granted for adultery, of which 59 were at the instance of the husband and 51 at the instance of the wife; and that, in the same year, 81 decrees for divorce were granted for desertion, of which 20 were at the instance of the husband and 61 at the instance of the wife; and the statistics show that the number of divorce cases has, relatively to the population, continued about the same.

It has been the statute law in Scotland since 1600 that the guilty spouse cannot marry the paramour during the lifetime of the other spouse, but in practice this has been generally evaded by not putting the name of the paramour into the decree of divorce. The large proportion of the divorced husband's property allowed to the wife and children by the law of Scotland is believed to have a considerable effect in reducing the number of divorces.

Ireland.—In Ireland, where the majority of the population are Roman Catholics, and where, apparently, conditions of life differ materially from those in England, divorce *a vinculo* of parties there domiciled is only obtainable (as in England before 1857) by private Acts of Parliament, after a divorce *a mensa et thoro* has been granted by the King's Bench Division of the Irish High Court (which now exercises the powers of the old Ecclesiastical Courts), and (if the suit be by the husband) after judgment has been obtained in an action in the Irish courts for crim. con., the minimum expense of such proceedings being between £450 and £500 (evidence Mr. Roberts, 42,603; 42,627). Since the passing of the Divorce and Matrimonial Causes Act, 1857, there have been 39 Private Divorce Acts (Mr. Roberts, 42,624).

Isle of Man.—Divorce *a vinculo* can only be granted by Act of Tynwald, founded on a decree of judicial separation granted by the Chancery Division of the High Court of Justice in the Isle of Man, which, by the Ecclesiastical Civil Judicature Transfer Act, 1884, has jurisdiction in matrimonial matters, and follows the principles upon which the Ecclesiastical Courts acted.

Channel Islands.—There appears to be no right to proceed to obtain judicially a divorce *a vinculo*, and there have been no legislative proposals with that object.

(II.) British Dominions

India.—The dissolution of marriage among the Christian communities in India, whether European, domiciled or country-born (save that in the native states the Act applies to British subjects only), is regulated by the provisions of Act IV. of 1869, usually called the Indian Divorce Act, under which decrees of divorce may be granted on grounds similar to those which exist at the present time in England, and where, since the marriage, a Christian husband has abandoned Christianity. Jurisdiction to grant any relief under the Act is confined to cases where (*a*) the petitioner professes the Christian religion; (*b*) resides and is domiciled in India at the time of presenting the petition; and (*c*) the marriage was solemnized in India. The two latter restrictions have inflicted in numerous cases great hardship, and the Commission made some suggestions thereon, which it is now proposed to incorporate in a special Act. The decision of Sir H. Duke in *Keyes v. Keyes* (1921) only emphasized the above which was good law before. It may be noted in passing that, by section 495 of the Indian Penal Code, adultery is made a criminal offence in the case of a man who, without the consent or connivance of the husband, has illicit intercourse with a woman who is known to be the wife of another man.

Canada.—The British North America Act, 1867, by section 91, conferred upon the Parliament of Canada exclusive legislative authority in relation to marriage and divorce, but by section 129 all laws in force in the provinces of Canada, Nova Scotia and New Brunswick were continued in such provinces respectively, and, by section 146, the provisions of the Act were extended to other provinces admitted to the Union. In the provinces of Nova Scotia, New Brunswick, Prince Edward I. and British Columbia, there existed at the time of the Union courts of divorce, and they still continue to exercise their functions. The grounds in those provinces are as follows: in Prince Edward I. and New Brunswick, adultery, impotence, or consanguinity, and, in Nova Scotia, cruelty as well.

The Privy Council, the highest court of appeal, decided in 1919 (*Walker v. Walker*) that the English Act of 1857 applies to and is part of the substantive law in all the provinces of Canada except Ontario and Quebec. There being no divorce courts in Ontario and Quebec, recourse for relief must be had to the Parliament of Canada by private Act.

Union of South Africa.—(*a*) Cape Province.—According to Roman Dutch law, which is in force in that province, the grounds upon which divorce may be granted are adultery, malicious desertion, unnatural crime, perpetual imprisonment, long absence, and refusal of marital privileges, though it would appear that recourse is seldom, if ever, had to the latter four grounds. (*b*) Province of Natal.—Divorce is granted on the ground of adultery or malicious desertion for not less than 18 months before the suit. These provisions, however, do not apply to the native tribes, which are governed under their own system of laws.

Newfoundland.—There is no law relating to divorce.

New South Wales.—By the Matrimonial Causes Act, 1899 (Act No. 14, 1899), Part IV., ss. 12–16, divorce is granted, on the petition of a husband, for the adultery of the wife, and, on the petition of a wife, for the adultery of the husband, if the husband is domiciled in New South Wales when the suit is instituted, or such adultery is incestuous, or is coupled with (1) bigamy, or (2) cruelty, or (3) desertion, without reasonable cause or excuse, for three years or upwards. In addition to the above, on the petition of either party, if domiciled in New South Wales for three years or upwards, divorce is granted for malicious desertion during three years or upwards; on the ground that the husband has, during three years, been a habitual drunkard, and has left his wife without means of support, or has been guilty of cruelty; on the ground that the wife has, during three years, been a habitual drunkard, and has neglected her domestic duties, or been unfit to discharge them; on the ground of imprisonment for three years under commuted sentence for a capital crime, or under sentence of seven years or upwards; on the ground of conviction for attempt to murder or inflicting grievous bodily harm; on the ground of the respondent repeatedly assaulting and cruelly beating the petitioner; on the ground that the husband has been in the last five years frequently convicted, has had sentences of three years in the aggregate, and has habitually left his wife without support.

New Zealand.—By the Divorce and Matrimonial Act 1908, No. 50, as amended by the Acts 1912, No. 22; 1913, No. 69; 1919, No. 53, and 1920, No. 70, either husband or wife can obtain a divorce for adultery or wilful desertion for three years. If the wife is living separated and the husband leaves her without reasonable maintenance for three years he is deemed to have wilfully deserted her (Act of 1913). If either husband or wife fails to comply with a decree for restitution of conjugal rights the other can obtain a divorce forthwith, and the Court may in its discretion dissolve any marriage on the petition of husband or wife where the parties have been living separate for three years under decree of judicial separation or magistrate's order or deed or merely by mutual consent (Act of 1920). Where the husband has been an alien enemy the wife, if a natural-born British subject, can divorce him if he has left New Zealand for more than 12 months (Act of 1919). Habitual drunkenness for four years coupled with cruelty or with leaving the wife without means of support, or, in the case of the wife, coupled with neglect of domestic duties, is also a ground for divorce. Other grounds are conviction and sentence of seven years or upwards for attempting to take the life of the petitioner or any child of the petitioner or respondent or the conviction of the murder of such a child or the fact of being a lunatic confined in New Zealand for an aggregate period of seven years within 10 years of the filing of the petition.

Queensland.—By the statutes of Queensland, Matrimonial Causes Jurisdiction Act of 1864 (28 Vict. c. 29) and Matrimonial Causes Act of 1877 (39 Vict. c. 13), the provisions of the imperial statutes (20 and 21 Vict. c. 85, 21 and 22 Vict. c. 93, 21 and 22 Vict. c. 108, and 22 and 23 Vict. c. 61) are reënacted, so that the law is substantially the same as in England.

South Australia.—In South Australia divorce is granted on the same grounds as in England, except that in the case of adultery coupled with desertion in a wife's suit one year's desertion is substituted for two years.

Tasmania.—The provisions of the imperial statutes (20 and 21 Vict. c. 85, 21 and 22 Vict. c. 108, 22 and 23 Vict. c. 61) have been made applicable by statute in Tasmania, so that the law is substantially the same as in England.

Victoria.—In Victoria the petition may be presented and decree granted on the same grounds as those at present existing in England. In addition to the above, on the petition of a petitioner domiciled for two years in Victoria, a decree may be granted on the ground of desertion for three years; on the ground that the respondent husband has been a habitual drunkard for three years, and has left his wife without means of support, or has been guilty of cruelty; on the ground that the respondent wife has been a habitual drunkard for three years, and has neglected her domestic duties, or rendered herself unfit to discharge them; on the ground of imprisonment for three years, under commuted sentence for a capital crime, or under sentence of penal servitude for seven years or upwards; on the ground

of a conviction within one year previously for attempt to murder the petitioner, or of having assaulted him or her with intent to inflict grievous bodily harm, or on the ground that the respondent has repeatedly during that period assaulted and cruelly beaten the petitioner; on the ground that the respondent husband has been, in the preceding five years, frequently convicted of crimes, and has been sentenced in the aggregate to imprisonment for three years, and has habitually left his wife without means of support; on the ground that the respondent husband has been guilty of adultery in the conjugal residence, or coupled with circumstances or conduct of aggravation or of repeated acts of adultery.

Western Australia.—Until 1912 the divorce laws of this state, which were regulated by an ordinance (27 Vict. No. 19), were similar in all respects to the laws of England, but Act No. 7 of 1912 contains material alterations in the law.

The causes upon which the divorce may be granted, as enumerated in that Act, are adultery; malicious desertion for five years; on the ground that the respondent (husband) has been a habitual drunkard for four years, and has either habitually left his wife without means of support or has been guilty of cruelty towards her; or, the husband being the petitioner, that his wife for a like period has been a habitual drunkard, and has habitually neglected her domestic duties or rendered herself unfit to discharge them; on the ground of imprisonment for three years under commuted sentence for a capital crime or under sentence for seven years or upwards, or, the wife being the petitioner, that the husband has been in the last five years frequently convicted, has had sentences of three years in the aggregate, and has habitually left his wife without means of support; on the ground of conviction for attempt to murder the petitioner or inflicting grievous bodily harm on him or her; further, on the ground that the respondent is a lunatic or a person of unsound mind, has been confined in an asylum or other institution in accordance with the provisions of the Lunacy Act of 1903 for a period or periods not less in the aggregate than five years within six years immediately preceding the suit and is unlikely to recover.

(III.) European Countries

It should be kept in mind that in all countries the Roman Catholic Church absolutely forbids its adherents to apply to the civil courts for a divorce *a vinculo*, and in modern European states there is frequently a conflict between the law of the State and the law of the Church on this subject. In certain cases the Church permits the spouses to separate and will sometimes annul a marriage if properly approached.

Austria.—In Austria, among Protestants, divorce may be granted on the ground of adultery, namely, the adultery of the wife, condemnation for crime, immoral habits, infectious diseases, ill-treatment, threats or serious vexations, unconquerable aversion; and among the Jews by mutual consent, or on the adultery of the wife.

Belgium.—In Belgium, divorce is granted on the following grounds, namely, the adultery of the wife, the adultery of the husband if he shall have kept his mistress in the common residence, violence endangering life (*excès*), cruelty (*sévices*), grave indignities (*injures graves*), sentence of one of the parties to an infamous punishment involving loss of civil rights, mutual and unwavering consent of the parties expressed in manner prescribed by law.

Bulgaria.—By the law of the orthodox Greek Church, and therefore of Bulgaria, divorce *a vinculo* only is recognized. It may be granted on the grounds of adultery, cruelty, threat or designs against the life of the other party to the marriage, absence of the husband for four years if his whereabouts are unknown, or, if his whereabouts are known, without sending his wife means of support; impotence; insanity; epilepsy; idiocy, or syphilis supervening after marriage and incurable; sentence to severe or degrading punishment for theft, fraud, embezzlement or homicide; unsubstantiated charge of adultery made by one party to the marriage against the other; unnatural crime of the husband upon his wife; restraint on religious liberty; drunkenness, when accompanied by squandering property or destroying the home, or an otherwise disorderly or dissolute manner of life; abandonment of the husband by the wife, driving him from his home without sufficient grounds followed by refusal for three years to live with him again.

Denmark.—In Denmark judicial divorces are obtainable on the grounds of adultery, bigamy, desertion (if malicious, after three years; if simple, *i.e.* absence without known or apparent cause, after seven years), absence for five years where the presumption is that the absentee is dead, imprisonment for life. Administrative divorces may also be obtained on the grounds of insanity, separation for three years, sentence of three years' penal servitude.

France.—In France, divorce, which had been introduced for the first time in 1792, but had been abolished at the Restoration in 1816, resumed its place in the Civil Code in 1884. The grounds upon which it is now permitted are adultery, violence endangering life (*excès*), cruelty (*sévices*), grave indignities (*injures graves*), condemnation of either spouse to an afflictive punishment.

Germany.—By the German Civil Code of 1900 all the previous laws of the federal states have been abolished, and the absolute grounds upon which decrees for divorce are now granted throughout the German Reich are adultery, bigamy, crime against nature, attempt on the life of the other party to the marriage, malicious desertion for one year, insanity of three years' duration after the marriage, destroying intellectual communion between parties, and holding out no hope of recovery. The Court has a discretion to grant divorce on the ground of serious breach of conjugal duties, and dishonourable or immoral conduct, under which all vices and bad habits may furnish a sufficient ground.

Greece.—Divorce in Greece is regulated by the Roman and Byzantine laws, in accordance with the provisions contained in the collection of Harmenopoulos. The grounds for divorce are established in No. 117 of the Novellae Constitutiones of Justinian (with some important amendments) and are, on the petition of the husband, adultery; that the wife attempted the life of her husband, or, being aware of plots against it, has not disclosed them to him; non-disclosure to her husband of knowledge of a conspiracy against the sovereign; without her husband's consent staying the night at another house, except the house of her parents; without her husband's consent attending races, theatres or sports; against her husband's wish attending dinners or bathing in the company of men; procuring abortion. On a wife's petition, the grounds are, that the husband entertained schemes against the sovereign, or, being aware of such, has not denounced them to the authorities; that the husband has attempted the life of his wife, or, being aware of plots against it, has not disclosed them to her, or undertaken to prosecute the authors of them; that he has endeavoured to procure her to commit adultery; that he has brought a false accusation of adultery against her; adultery in the conjugal home; adultery in the same town, if persisted in; impotence of husband, existing before marriage and continuing at least three years after it.

Hungary.—Prior to 1894, each religious denomination was governed by separate regulations, but in that year marriage and divorce in Hungary and Transylvania were regulated by the Civil Marriage bill of that year which came into force in 1895; and the absolute grounds upon which divorce is permitted by the State (*see* note above), without distinction of creeds, are adultery; unnatural crimes; bigamy; desertion; attempt upon life or serious maltreatment endangering safety or health; sentence of death or penal servitude or imprisonment for five years. The discretionary grounds are violation of marital obligations, other than above; inducing or attempting to induce a child of the family to a criminal act or immoral life; the respondent persisting in leading an immoral life.

Italy.—No divorce is permitted.

The Netherlands.—Adultery and malicious desertion under Roman Dutch law; and, by more recent addition, imprisonment for four years; grave injuries or ill-treatment endangering life; a lapse of five years after a judicial separation (by consent or otherwise) without reconciliation, are now grounds for divorce.

Norway.—The Norwegian Act of Aug. 20 1909 has effected radical changes in the law. Either party to the marriage is now entitled to a divorce, where, at the time of marriage, the other spouse, without the knowledge of the former, has suffered from a physical defect making him or her unsuited for marriage, or from epilepsy, or leprosy, or from venereal disease in an infectious form, or from insanity; or (the husband being petitioner) where the wife has been made pregnant by someone other than the husband; where either party has been guilty of certain crimes dealt with in the General Criminal Code, such as the contracting and transmitting, or exposing any others to, an infectious sexual disease, which has been contracted in consequence of immoral conduct, a serious offence against decency, or against a child under 16 or anyone being a ward of the party, incest, unnatural offences, etc.; adultery, bigamy, or such crimes as are dealt with in the Criminal Code, *e.g.* abduction of children and minors from the care of their parents and guardians, or a crime involving bodily injury of the other spouse, or of any deliberate crime by which the other spouse suffers injury in body or in health; or cruelty to children; or exposing them to conditions which are clearly dangerous to their morals; sentence of loss of liberty for three years or upwards; sentence to hard labour or confinement in an inebriate home for repeated acts of vagrancy or drunkenness; refusal of conjugal rights for two years; insanity for three years with no reasonable prospect of recovery; where a separation has been in existence for two years after formal decree, or for one year after such decree, if both parties assent to its becoming a decree of divorce; where there has been a separation for three years without decree, and no conjugal relations during that time (*see* also Report of Divorce Commission, Appendix V., pp. 43–5).

Portugal.—Prior to 1910, there was no law of divorce in Portugal. By Article 4 of a law passed on Nov. 4 of that year (copy set out in Appendix XXII., Report of Divorce Commission, pp. 152–3), the causes for divorce are:—(1) adultery; (2) conviction of one of the major crimes specified in Articles 55 and 57 of the Penal Code; (3) ill-treatment; (4) abandonment of home for not less than three years; (5) absence for not less than four years, during which the absentee gives no tidings of himself or herself; (6) incurable lunacy, three years after the date on which insanity has been declared by the competent authorities; (7) separation *de facto* by mutual consent for 10 years; (8) inveterate gambling habits; (9) incurable contagious disease or any disease which induces sexual aberration.

Further, by Article 34, the non-success of a suit for divorce instituted for causes 1, 2, 3, 4, 8, 9 aforesaid affords sufficient cause for the respondent in such previous actions petitioning for a divorce.

Sections 35–40 permit divorce by mutual consent, subject to the provisions laid down in those sections.

Rumania.—In accordance with the laws of the orthodox Greek Church, only divorce *a vinculo* is recognized, the grounds for which it may be granted being adultery; injuries or ill-treatment; sentence to imprisonment; attempt on the life of the other party to the marriage, or failure to warn such party of such attempt when made by a third party. Divorce may also be obtained by mutual consent, subject to various formalities.

Russia.—In Russia, before the revolution, the ordinances of each church embodied in the General Code of Laws laid down the grounds upon which divorce was to be granted.

For the members of the Russian Church, and for "the Old Believers," the grounds upon which decrees of divorce could be made were adultery; bigamy; impotence existing at marriage; the absence of the respondent for five years without news; sentence of a court of law, under which one of the parties to a marriage was condemned to loss of civil rights involving deportation; the entrance of both parties into a religious order, in cases where there are no children needing parental care; the conversion of a non-Christian spouse to the Russian Church, provided such a party or the other party to the marriage desires the dissolution. Members of the Lutheran Church (other than those resident in Finland for whom the grounds of divorce appear to be adultery, illicit intercourse with a third party after betrothal, and malicious desertion for at least one year) may seek divorce in their consistorial courts on the grounds of adultery; concealed loss of virginity of the wife before marriage; attempt to poison; five years' desertion; impotence and repugnance to marital intercourse; refusal to fulfil conjugal duties; incurable infectious disease; madness; depravity of life; cruelty and offensive treatment; attempts by one party to bring dishonour on the other or deprive him (or her) of his (or her) freedom, office, or occupation; unnatural propensities; grave crimes involving sentence of death or a punishment in substitution; penal exile. Among the Jews, divorces were granted by the rabbi. The marriage might be dissolved by mutual consent, or on grounds based on Mosaic law.

The law of Poland was, before the war, regulated by a decree of the Russian emperor of 1836, under which there were separate regulations for the members of the Roman Catholic, the Greek Orthodox, the Greek Unified and Protestant Churches, for members of denominations other than the above, and for cases where the religions of the parties to the marriage are different.

Spain.—No divorce is permitted.

Sweden.—The grounds for judicial divorces are adultery; illicit intercourse of either party with a third party after betrothal, or the intercourse of the wife with a third party before betrothal; malicious desertion for one year, provided the absentee has left the kingdom; absence without news for six years; or attempt by one party to the marriage on the life of the other; on the grounds that either party is suffering from bodily incapacity, or has concealed the fact of being affected with an incurable contagious disease; sentence of life imprisonment; insanity of three years' duration which is pronounced incurable. Divorce may also be obtained by direct appeal to the king's royal prerogative, where one party has been condemned to death or civil death; or condemned for a gross offence, or one involving temporary loss of civil rights; where one party has been imprisoned for at least two years; on the ground of prodigality, drunkenness, or violent disposition, or incurable aversion and hate, which has lasted after one year's separation *a mensa et thoro.*

Switzerland.—Prior to Jan. 1 1876, the different cantons of Switzerland had individual laws regulating divorce, but after that date the matter was regulated by a federal law throughout the country, and is now regulated by the Code Civil of Dec. 10 1907 which made but little change in the law then existing. The grounds laid down by that code are adultery; attempt by one party on the life of the other; cruelty (*sévices*); grave indignities (*injures graves*); the commission of an infamous crime by one party, or base conduct by one party rendering married life intolerable; malicious desertion for two years; insanity rendering married life unbearable, and which after three years' duration is pronounced incurable; conduct rendering married life unbearable. (R. Th.)

(IV.) United States

Statistics concerning marriage and divorce are not compiled annually in the United States. The period 1867–1906 was thoroughly covered by two Federal reports, and in 1917 a government appropriation became available for continuing the investigation to the end of 1916. Because of the World War, however, it was decided to postpone the gathering of statistics for the whole decade and to make a special report for the year 1916 alone. This report was issued in 1919 by the Census Bureau. Figures for a single year may register abnormal fluctuations, but it is apparent that divorce was rapidly increasing from the following figures for the years 1896, 1906 and 1916:—

	1916	1906	1896
Marriages	1,040,778	853,290	613,873
Divorces	112,036	72,062	42,937

From 1867 to 1906 the number of divorces granted totalled 1,274,341, each period of five years showing a constant increase averaging about 30%, while population was increasing at the rate of about 10%. The number of divorces per 100,000 pop. in 1916 was 112 as compared with 84 in 1906. It is noteworthy, however, that four states—Colorado, Maine, South Dakota, West Virginia—and the District of Columbia reported fewer divorces in 1916 than in 1906. The following table indicates causes of divorces in 1916, excluding 3,334 cases for which statistics were not given:—

All causes 108,702			Granted to Husband 33,809	Granted to Wife 74,893
Adultery . . .	12,486	11·5%	6,850	5,636
Cruelty . . .	30,752	28·3	5,895	24,857
Desertion . . .	39,990	36·8	16,908	23,082
Drunkenness . .	3,652	3·4	271	3,381
Neglect to provide .	5,146	4·7	—	5,146
Combination of preceding . . .	9,332	8·6	1,440	7,892
Other causes . .	7,344	6·8	2,445	4,899

It appears that 31·1% of the divorces were awarded in 1916 to the husband and 68·9% to the wife; for 1906 the percentages were 32·5 and 67·5 respectively. It is probable that the wife more frequently has legal ground for divorce. Of the total number in 1916 desertion was the most frequent ground, and cruelty next, these two causes accounting for 65·1% of all. Of the 108,702 divorces noted in the table above, 69,036, or 63·5%, were granted in the state where the marriage had taken place, as compared with 76·3% for the period 1887–1906. It is not possible to determine the extent to which persons migrate to another state for the purpose of obtaining a divorce, as population is constantly shifting, but many changes of residence are made for this purpose and the tendency appears to be growing. The question of uniform state divorce laws was discussed in 1913 at the conference of governors, but the conflicting views held in different sections of the country do not point to early action. There is a growing demand, especially on the part of church authorities, for an amendment to the Federal Constitution to empower Congress through legislation to regulate marriage and divorce.

DIXMUDE, or in Flemish Dixmuyde, a town in the province of West Flanders, Belgium, on the right bank of the Yser, with a pop. which had risen from 3,278 in 1900 to 3,460 in 1914. It is the centre of an agricultural district noted for cattle-rearing and for its dairy produce. The 15th-century church of St. Nicolas had a remarkably fine rood-loft erected in the 16th century by Jean Bertet and an Adoration of the Magi by Jordaens (1644).

As a result of the World War the town was almost totally destroyed. Dixmude constituted in effect one of the principal points of passage of the Yser and, at the end of Oct. 1914, a force of 5,000 Belgians and a brigade of French marines under Admiral Ronarch successfully resisted the desperate efforts of the Germans to seize the town. The town held out until Nov. 10, by which date, by damming the lower reaches of the Yser and opening the sluices between Dixmude and Nieuport, a large flooded area was placed between the two armies. The town was retaken by the Belgians on Sept. 29 1918. The pop., which after the Armistice had been slowly returning, numbered in 1921 about 1,000 persons, housed for the most part in temporary huts, and the rebuilding of the town had begun.

DJEMAL PASHA (Ahmad Djemal) (1875–), Turkish politician and soldier, was born at Bagdad about 1875. His father, a person of some distinction, gave him a careful French education, and placed him in the army, where his energy and activity speedily brought him to the rank of lieutenant-colonel. As such he went to Salonika, where he spent five years, and not only gained an intimate understanding of the Young Turk ideas, but became their most able supporter. In 1909, when Djemal went as governor to Adana in Cilicia, he was charged with the task of strengthening the Young Turk ideas and the elimination of contrary currents. It was in administrative matters that Djemal's talents were most conspicuous. In 1911

he was made governor of his native town, Bagdad, but a year later he was sent to the Balkan War in command of a division, and subsequently contrived to become Vali of Constantinople.

After once more filling a military rôle for a short time as commander of the I. Corps at Constantinople, he handed over the command to the German general, Liman von Sanders, and devoted himself to politics. At that time Djemal, Talaat and Enver constituted a triumvirate which was the only effective Turkish Government, and already a certain antagonism, which had its roots in personal ambition, had sprung up between Djemal and Enver. Djemal obtained the Ministry of Public Works and immediately afterwards the Ministry of Marine. Djemal gave Adml. Limpus and the English naval mission a free hand, as Enver did the German military mission. In the spring of 1914 Djemal attended the French fleet manœuvres, and on Aug. 9 1914, after the outbreak of the World War, he wished the homegoing Frenchmen glory and victory. He was unwilling that Turkey should attach herself to Germany at once, even though the victory of the Central Powers might he certain. Enver, fearing Djemal's influence in Constantinople, banished the Minister of Marine, at the end of 1914, to Syria, as commander-in-chief of the IV. Army. There his military achievements were insignificant, but he fought the plagues of locusts and the epidemics, exerted himself over the cultivation of the land, the draining of the marshes, the building of new and the improvement of old streets, even began the work of afforestation, and made efforts to raise the level of public education. In Oct. 1917 he was removed by order of Enver from the command of the IV. Army and made commander-in-chief of all the troops in Syria, Palestine and the Hejaz, with the exception of the army operating on the Sinai front. This edict led to disorder and friction. Djemal's power was not lessened south of the Taurus, but he took no more interest in the conduct of the military operations. In Dec. 1917 he betook himself to Constantinople, and, greatly to the wrath of Enver, resumed his activities as Minister of Marine. However, he was given no more opportunities, either political or military. When, in the autumn of 1918, Turkey, and with her the Young Turk Government, was broken in pieces, Djemal Pasha was forced to flee, and he repaired to Germany where he wandered about under an assumed name. Later he obtained refuge in Switzerland, and subsequently he made his way to the East. In 1921 he was reported to have found employment as military adviser to the Amir of Afghanistan.

DOBSON, HENRY AUSTIN (1840–1921), English poet and man of letters (*see* 8.352), died at Ealing Sept. 2 1921. His later work consisted of prose essays, notably *At Prior Park* (1912), *Rosalba's Journal* (1915) and *Later Essays* (1921), all studies of the 18th century, and *A Bookman's Budget* (1917).

DOGGER BANK, BATTLE OF.—One of the most important naval engagements in the World War was fought near the Dogger Bank on Jan. 24 1915 between the British and German battle cruiser squadrons.

Movements of the British fleet had led the Germans to suspect some scheme for blocking their harbours was afoot, and Rear-Adml. Hipper was despatched at nightfall on Jan. 23 to reconnoitre off the Dogger Bank. His force consisted of the four battle cruisers of the First Scouting Group, the "Seydlitz" (flag), "Derfflinger," "Moltke" and "Blücher," four light cruisers of the Second Scouting Group, and 22 destroyers of the 5th Flotilla and the 15th and 18th Half Flotillas. Intelligence of the departure of the German force had been intercepted at the British Admiralty, and Vice-Adml. Sir David Beatty (later Earl) put to sea from the Forth at 6 P.M. on the evening of the 23rd. With him were the five battle cruisers of the 1st and 2nd Battle Cruiser Squadrons, the "Lion" (flag), "Tiger," "Princess Royal," "New Zealand" and "Indomitable," and the four light cruisers of the 1st L.C.S. under Commodore W. E. Goodenough in the "Southampton." His orders were to proceed to a rendezvous in 55° 13′ N 3° 12′ E, 180 m. from Heligoland, where he was to meet Commodore Tyrwhitt in the "Arethusa" (flag) with the 1st, 3rd and 10th Flotillas, mustering three light cruisers and 30 destroyers. Behind him to the northward was the Grand Fleet. The 3rd Battle Squadron (seven King Edward VII. class) had left Rosyth two and a half hours after him and the commander-in-chief had put to sea from Scapa with the battle-fleet. In the hope of intercepting the enemy on his way back Commodore (S)[1] had been ordered to proceed towards Borkum with the "Lurcher," "Firedrake" and four submarines. In heavy guns the British force was decidedly superior. The British battle cruisers mounted 24 13·5-in. and 16 12-in. against the German 8 12-in., 20 11-in. and 16 8·2-in.

Beatty reached the rendezvous at 7 A.M. It was a winter morning with a calm sea and good visibility. His battle cruisers were in a single line ahead with Goodenough's light cruisers a couple of miles on the port bow. Course was altered to S. by W. at 18 knots. Ten minutes later the "Arethusa" was sighted to the south-eastward about 7 m. on the port bow. The "Aurora" and "Undaunted," the two other Harwich light cruisers, were still some 15 m. to southward of her out of sight. Hardly had the "Arethusa" been identified by the "Lion" when flashes of gunfire were seen to the S.S.E. This was the "Aurora" engaging the "Kolberg" coming up from the S.E. on the port bow of Hipper's squadron. The "Kolberg" was hit twice and withdrew at 7:25 A.M.

At the sound of the guns Admiral Beatty ordered his light cruisers to chase to the southward. The "Southampton" had hardly gone a couple of miles when the "Aurora" was seen on the starboard bow, and soon afterwards enemy battle cruisers were sighted on the port bow to the south-east. Dense clouds of smoke were pouring from their funnels and they were evidently getting up steam for full speed. It was now ten minutes to eight. Beatty's unexpected appearance had come on Hipper as an unpleasant surprise, and he turned to the S.E. and made off at full speed with Beatty some 13 to 14 m. behind. Beatty's position at 8:30 A.M. was about Lat. 54° 50′ N. Long. 3° 40′ E., and the two forces had settled down to the long rush to Heligoland 140 m. away (*see* fig. 1). When the chase commenced the British

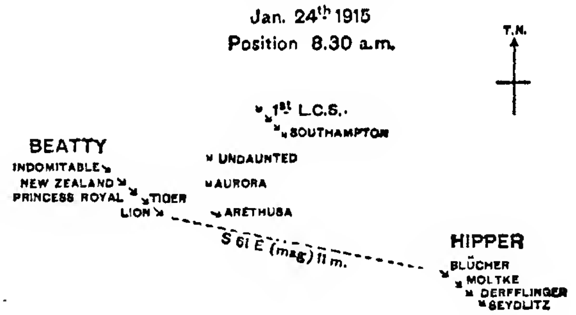

Fig. 1.

battle cruisers were in single line ahead on a S.E. by S. course working up to full speed. The "Arethusa," "Undaunted" and "Aurora" now took station about 5 m. on the "Lion's" port bow in a ragged line abreast some 2 m. apart. Goodenough with his squadron was further off on the port bow steaming hard after the enemy. Hipper was 11 m. sharp on the "Lion's" port bow on a S.S.E. course in full flight for Heligoland with his light cruisers and destroyers ahead of him sharp on his starboard bow. The action about to commence took the form of a long chase in which speed was the principal consideration. Here Beatty's squadron had a considerable margin of superiority. It maintained an average speed of probably 26 knots; while Hipper's may have done just over 23 till the "Blücher" fell out, and something over 24 afterwards. By 8:42 A.M. the range of the "Blücher" had come down to 22,000 yd., and at five minutes past nine the Vice-Admiral hoisted the signal to engage. At 9:0, some 17 minutes after the first shot, the "Lion" obtained her first hit on the "Blücher." About ten minutes later, at 9:20 A.M., a movement of some sort was observed among the enemy destroyers, and in

[1] Commodore (S) = Commodore (Submarines), Commodore Roger Keyes.

expectation of an attack British destroyers were ordered to take station ahead, but none of them except the " M " class had the speed to do so and the remainder accordingly dropped back to clear the range. At 9:35 the " Lion " made the signal to engage corresponding ships in the enemy's line, not intending it to refer to the " Indomitable," which had dropped some way astern, but the " Tiger " took it to include the " Indomitable," and instead of firing at the " Derfflinger," the second ship, concentrated on the " Seydlitz," leaving the " Derfflinger " unfired at. It was not till 9:45 that the Germans scored their first hit on the " Lion," sending an 11-in. through her armour aft. Five minutes later a 13·5-in. crashed into the after turret of the " Seydlitz," wrecking a portion of the stern and igniting a charge in the working chamber under the turret. The flames roared up through the turret and passed through a connecting door into the adjoining one, setting the charges alight there and turning both turrets into furnaces where all the guns' crews perished. The " Blücher " was now having trouble with her engines, and at ten o'clock drew out of the line going heavily. The range increased for a time partly due to the " Lion " slowing down to 24 knots at 9:53 to allow the line to close up, partly to the enemy turning away for a time. The " Blucher " was on fire by this time and had dropped behind to a position 3 or 4 m. on the " Seydlitz's " port quarter. At 10:22 Adml. Beatty, to bring the rear of his line into action, ordered his battle cruisers to form on a line of bearing N.N.W. and to proceed at utmost speed. But repeated hits were telling on the " Lion," and at 10:45 she was dropping back. As it was clear that she could no longer maintain her place at the head of the line, Beatty at 10:47 made a signal " to close the enemy as rapidly as possible consistent with keeping all guns bearing," but the " Tiger " was the only one to receive it and then only the words " close the enemy." About 10:50 A.M. the " Lion " received a bad hit on the port side aft, which holed the feed tank and did serious damage in the engine room. This was the crisis of the action; at this moment the wash of a periscope was seen on the starboard bow (in a position Lat. 54° 0′ N. 5° 15′ E.), and Beatty immediately made a signal to alter course eight points to port. This was hauled down at 11:02 A.M. and the squadron turned to N.N.E. (see fig. 2).

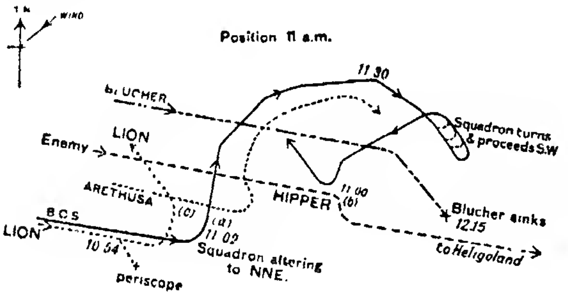

FIG. 2.

But the " Lion " was no longer able to perform the duties of a flagship. Her wireless and her searchlights were out of action, she had fallen out of line and the rest of the squadron was drawing every moment farther and farther away to the northward. The " New Zealand " was some way behind, and Rear-Adml. Sir Archibald Moore, the second in command, whose flag was flying in her, had not grasped the intention or nature of the turn.

It was urgently necessary to resume the chase. Beatty therefore ordered two signals to be made—compass B (course N.E.) and A.F. (attack the rear of the enemy), and then a third: " Keep nearer to the enemy. Repeat the signal the Admiral is now making." These all went up practically at the same time, and had they been understood in the sense in which they were made would have redeemed the situation. Unfortunately Rear-Adml. Moore only received the first two at 11:21 A.M. and then read them as meaning " attack the rear of the enemy bearing N.E." The " Blücher " was then bearing roughly N.E., and taking them as an order to attack the " Blücher " he steered towards her. Hipper altered for a few minutes to the S., bringing a heavy fire to bear on the " Tiger," which received seven hits at this time, then resumed his course E.S.E. and drew rapidly out of range. The " Lion " in a crippled state steamed slowly to the north-westward, while the remainder of the squadron some 6 or 7 m. off began to circle round the " Blücher," whose fate was now sealed. The destroyers " Meteor " and " Miranda " attacked her, but she was still in action and sent four shots into the " Meteor," wrecking her boiler room. At 11:38 A.M. the " Arethusa " came up and fired two torpedoes into her. She ceased firing, listing heavily with fires raging fore and aft. Hipper was now some 15 m. off, only 70 m. from Heligoland, and Rear-Adml. Moore apparently did not think it worth while to continue the chase. It was not till 11:52 A.M. that he assumed active command and made his first signal to form single line ahead and steer west. Beatty meanwhile had transferred his flag to the destroyer " Attack " and was racing after his squadron. About half-past twelve he reached the " Princess Royal," hoisted his flag in her and was about to resume the chase. But pursuit was now hopeless, and the situation not too favourable. The " Lion " could only go 10 knots and the High Sea Fleet was supposed to be coming up. Accordingly at 12:45 P.M. the squadron turned back. Hipper meanwhile made for home and got in touch with the German battle-fleet about 2:30 P.M. The " Blücher " had been lost, the " Seydlitz " seriously damaged and the " Derfflinger " hit three or four times. When Beatty turned home Jellicoe was hastening down to him with the battle-fleet. They met at 4:30 P.M. and it remained only to get the " Lion " home. In tow of the " Indomitable " and screened by the 1st and 2nd Light Cruiser Squadrons and two flotillas she reached Rosyth safely the next morning.

The loss of the " Blücher " was quickly reflected in German naval policy. Adml. von Pohl took Adml. von Ingenohl's place as commander-in-chief of the High Seas Fleet with definite instructions to revert to a more cautious policy.

On the British side the results were generally regarded as disappointing. It was believed that, had the pursuit been pressed, the " Seydlitz " and " Derfflinger " might have shared the " Blücher's " fate, but it must not be forgotten that the range was still over 18,000 yd. and the enemy's speed not seriously diminished. The battle, however, had a very real result. It fettered the initiative of the German commander-in-chief, and put an end to raids on the English coast for over a year.

See also Filson Young, *With the Battle Cruisers* (1921).

The following is a list of the forces engaged:—

BRITISH

1st Battle Cruiser Squadron.
" Lion " (flag), Vice-Adml. Sir David Beatty, Capt. Alfred Chatfield, 28 knots (designed).
" Princess Royal," Capt. Osmond de B. Brock, 28 knots.
" Tiger," Capt. Henry B. Pelly, 30 knots.
Armament 8 13·5-in., 16 4-in. (" Tiger " 16 6-in.).

2nd Battle Cruiser Squadron.
" New Zealand " (flag), Rear-Adml. Sir Archibald Moore, Capt. Lionel Halsey, 26 knots.
" Indomitable," Capt. Francis W. Kennedy, 25 knots.
Armament 8 12-in., 16 4-in.

1st Light Cruiser Squadron.
" Southampton," Commodore W. E. Goodenough, Comm. E. A. Rushton.
" Birmingham," Capt. Arthur A. Duff.
" Nottingham," Capt. Charles B. Miller.
" Lowestoft," Capt. Theobald W. Kennedy.
Armament 9 6-in., " Southampton " 8 6-in., 25 knots.

Harwich Flotillas.
" Arethusa," Commodore Reginald Tyrwhitt, Comm. E. K. Arbuthnot. 10th Flotilla: " Meteor " (Comm. Hon. Herbert Mead), " Miranda," " Milne Mentor," " Mastiff," " Minos," " Morris," speed 34 knots.
3rd Flotilla: " Undaunted," Capt. Francis St. John, " Lookout," " Lysander," " Landrail," " Laurel," " Liberty," " Laertes," " Lucifer," " Lawford," " Lydia," " Louis," " Legion," " Lark," speed 29 knots.
1st Flotilla: " Aurora," Capt. Wilmot S. Nicholson, " Acheron," " Attack," " Hydra," " Ariel," " Forester," " Defender," " Druid," " Hornet," " Tigress," " Sandfly," " Jackal." " Goshawk," " Phoenix," " Lapwing," speed 27 knots.

GERMAN

1st Scouting Group.

"Seydlitz," Rear-Adml. Hipper, 10 11-in., 12 5·9-in., 26 knots.
"Derfflinger," 18 12-in., 12 5·9-in., 27 knots.
"Moltke," 10 11-in., 12 5·9-in., 25 knots.
"Blücher," 12 8·2-in., 8 5·9-in., 24 knots.

2nd Scouting Group.

"Graudenz," "Stralsund," "Kolberg," "Rostock."

(A. C. D.)

DOGS (WAR).—That dogs could be usefully employed as auxiliaries in the prosecution of war, as was the case in the World War of 1914–8, is not a modern discovery. Both Greeks and Romans used them for offensive and defensive purposes and for maintaining communication on the field of battle. War-dogs are mentioned by Plutarch and Pliny, and Strabo describes how, in Gaul, dogs were armed with coats of mail. In the Middle Ages and in early modern history there are many stories, some of them no doubt legendary, of the participation of dogs in war. In the Crimean War, dogs were employed on sentry duty; in the American Civil War they were used both as sentries and guards.

An ancient writer, Camerarius, noted that guard-dogs could discriminate Christians from Turks; and a modern authority has stated that dogs employed during the war of 1914–8 could even detect men of unfamiliar regiments. Instinctive fidelity and keen scenting power make the proper sort of dog peculiarly suitable for training as an auxiliary in war. Further, a dog very readily acquires a sense of danger; and it was noted, during the World War, that dogs, if unable to reach or uncertain of a particular destination, would make their way back to their kennels. They would never cross the zone to the enemy. The same instinct for hurrying to the rear was, it may be added, observed in stray horses and mules.

Despite his acknowledged suitability, however, no modern systematic training of the dog for use in war began until the latter part of the last century. About that time the movement made considerable headway in Germany, mainly because of the energetic championship of the animal-painter, Jean Bungartz. In France, too, some progress was made and some official encouragement extended; but in England, apart from the private efforts of Lt.-Col. E. H. Richardson, no action was taken, and it was not until 1917 that a British war-dog training school was established at Shoeburyness.

In Germany there was, at first, a great difference of opinion on the question of the most suitable breed for training. Poodles were originally decided upon, because of their high degree of intelligence, but poodles suffer considerably when exposed to the heat of the sun and, though they have sharp scent, they are extremely short-sighted. The St. Bernard was then experimented with. The record of its ancestors at the Hospice was distinguished enough; but it seemed to have been forgotten that the Hospice dog, besides being short-haired, was also of lighter build than the modern St. Bernard. The pointer was next tried; but though it has unquestionably the necessary intelligence and physical strength, the hunting instinct is so deep-rooted in this breed as to be ineradicable except after years of labour. One principle the German authorities had insisted upon from the outset—that "a military dog cannot be produced from cross-breeds." The Scotch collie, pure-bred for centuries, was, therefore, some 20 or 30 years ago regarded with great favour in Germany as a potential war-dog. J. Bungartz, indeed, in his book on the subject of the war-dog, dated 1892, pays eloquent tribute to the collie's qualities. Later, however, the collies fell into disrepute; and during the World War the great bulk of the dogs employed with the German army (it has been stated that, almost immediately after the outbreak of war, the Germans placed some 6,000 war-dogs in the field) were German shepherd-dogs. Indeed, according to the returns of the German Society for Ambulance Dogs (Oldenburg) of 1,678 dogs sent to the front up to the end of May 1915, 1,274 were German shepherd-dogs, 142 Airedale terriers, 239 Dobermanns and 13 Rottweilers. The figures remained in a like proportion throughout the war. The ambulance dogs were able to distinguish between the dead and the apparently dead; the former they left untouched, even passed with signs of disgust, the latter they succoured. The English and French armies found it impossible to employ ambulance dogs on the western front during the late war; but the German army seems to have employed them, especially during the Russian retreat on the eastern front, with conspicuous success. It is indeed officially recorded that thousands of German soldiers owed their lives to ambulance dogs. Messenger-dogs also constituted an acknowledged part of the organization of the German army. An infantry regiment was allotted a maximum of 12 dogs, while a battalion might have six, the allotments being made by the Messenger Dog Section (*Meldehundstaffel*) at the Army Headquarters. The breeds chiefly employed for message-carrying work were German sheep-dogs, Dobermanns, Airedale terriers, and Rottweilers. The Germans, unlike the British, employed the dogs on the double-journey-"liaison" principle—that is, with two keepers, and the dog travelling backwards and forwards between both. In the British army the messenger-dog was trained to make the return journey only to the one keeper.

British war-dogs, which were placed under the signal section of the Royal Engineers, were employed principally in maintaining communication, though sentry-dogs did valuable work, especially in Salonika; but a British war-dog school was not established until 1917. Many types of dogs were used. Thus, of a total of 340 dogs sent to France from the school within a certain period, 74 were collies, 70 lurchers, 66 Airedales, 36 sheep-dogs, and 33 retrievers, the remainder being made up of 13 different breeds. A central kennel was established in France at Etaples. The training course at the school lasted about five or six weeks and the dogs and their keepers were then sent overseas. From Etaples the dogs were posted to sectional kennels behind the front line, each sectional kennel consisting of about 48 dogs and 16 men. From these kennels the dogs and their keepers in the proportion of one man to three dogs were sent up for duty in the trenches.

The war-dog training school of the French army was established at Satory about the same time as the English school was set up at Shoeburyness. Shepherd-dogs of various kinds, Airedale terriers and Scotch collies were mainly employed. Each French infantry battalion was allotted six dogs, the allotments being made from the Army Headquarters kennels. The U.S. army did not use dogs.

In determining a particular dog's suitability for war training, his physical condition should first be considered. Strength and agility combined, of course, with intelligence are in fact indispensable qualities. The chest should be broad, the legs sinewy and the paws of firm construction. Colour must also be taken into account. White dogs and those of "check" colouring are obviously unsuitable for war purposes. They would constitute too conspicuous a target. Sex, again, plays a part. A bitch in heat will, at any time, throw a pack into excited confusion and therefore, though trials have proved that bitches are apter at learning and are more trustworthy, they are not suitable for use in war. Castrated dogs, on the other hand, lack courage and temperament and are useless for work in the field. With regard to age it has been said that the dogs chosen for war training should not be less than one year and not more than four years old.

(C. E. W. B.; E. S. H.*)

DOHERTY, CHARLES JOSEPH (1855–), Canadian statesman, was born at Montreal, Quebec, May 11 1855. He was called to the Quebec bar in 1877, and became a Q.C. in 1887. He was elected to the House of Commons for the St. Ann's Division of Montreal 1908, being reëlected Sept. 1911 and in the by-election consequent upon his taking office as Minister of Justice in Nov. 1911. He was professor of civil and international law in McGill University for several years before entering the Government. He became a member of the Unionist Government in Dec. 1917. In 1920 he was made an Imperial Privy Councillor and the same year was a member of the Canadian delegation to the first assembly of the League of Nations at Geneva.

DOLLAR SECURITIES MOBILIZATION.—In the British system of war finance, 1915–7, an important part was played by the mobilization of securities. During the World War enormous supplies of war materials of all descriptions had to be purchased by England from abroad, and in addition, owing to the withdrawal of labour from production in the Allied countries, abnormal quantities of goods had to be obtained from the same sources.

The exchange facilities available were entirely inadequate for the purpose of making the payments necessitated by these purchases, and artificial methods had to be adopted to provide in suitable foreign currencies the funds required. The natural procedure was by borrowing, and by the realization of such assets as were marketable in the creditor countries.

Though in some instances, and more particularly in the early days of the war, it was possible to effect loans abroad on the credit of the borrowing countries, it was found necessary to a large extent to provide collateral security in addition. The various securities quoted on the Stock Exchange and others of similar nature held in the Allied countries formed the natural and most fruitful field for obtaining suitable collateral and for providing the assets most readily marketable abroad.

Before the introduction of any official control a considerable amount of securities of the United States of America and other foreign countries was sold abroad, on account of the relatively high prices obtaining and the favourable terms on which the proceeds could be remitted home, owing to the fall in exchange rates which had already taken place. Even after the introduction of official action these natural sales continued, though necessarily in decreased volume. The funds provided by means of these sales and from loans effected abroad without collateral security supplied in the main the necessary sums to pay for the purchases made, but as the demand for goods and raw material became more insistent the British Treasury found it necessary to take official action. In July 1915 instructions were given to the Bank of England to purchase American dollar securities by private treaty or through the London Stock Exchange and forward them to New York for sale. By this means securities of the nominal value of $233,000,000 were obtained before the end of the year and the pressing requirements of the Treasury were satisfied.

By Dec. 1915, however, it had become apparent that this somewhat haphazard method of purchasing available securities was not altogether satisfactory nor likely to achieve the desired results, and it was therefore decided to adopt a more comprehensive scheme. Accordingly, the Treasury appointed a committee, known as the American Dollar Securities Committee, with a permanent secretary of the Treasury as chairman, the deputy governor of the Bank of England as deputy chairman, and four members, two of whom were nominated by the Bankers' Clearing House and two by the Committee of the London Stock Exchange. The management was placed in the hands of Mr. (afterwards Sir) George May, the secretary of the Prudential Assurance Company.

In order to obtain some idea as to the volume and class of securities available a circular letter was sent to all the larger investors, such as insurance companies, banks and trust companies, asking them to submit lists of American dollar securities held by them, with a view to a possible sale or loan to the Treasury. Active operations were begun in Jan. 1916, at the National Debt Office in Old Jewry, by the issue of a list of 54 selected American dollar bonds which the Treasury was prepared to purchase. The prices offered were based on the current New York closing quotations of the previous evening, the New York percentage price being converted into the London sterling price at the existing rate of exchange with accrued interest.

In illustration of the procedure adopted it may be mentioned that the official prices were not only posted up at the London Stock Exchange but by a special arrangement were telephoned by the General Post-Office to all the provincial stock exchanges at about 10 A.M. This enabled the country stockbrokers to deal promptly with the committee by means of a short telegram stating the amount they wished to sell and quoting the official number assigned to the particular security. Such bargains held good provided that the telegram was handed in at the provincial post-office not later than 2 o'clock (later extended to 4 o'clock) on the day of the quotation. As regards London dealings, the bargains were booked over the counter at the National Debt Office. To facilitate delivery of securities a branch of the Bank of England was installed in Old Jewry and on the Bank's officers devolved the duty of accepting the securities in good order and paying the purchase money. It is interesting to note that brokerage was paid by the Treasury and not by the seller, while unstamped bonds were accepted on the same terms as those bearing the English stamp. In the early days of the scheme payment was made at the seller's option in British Government Exchequer bonds then being issued. In this way the double purpose was served of obtaining the means of securing a credit in New York and increasing subscriptions for British Government securities. Additional lists of bonds and shares for which daily prices were quoted were published from time to time, while special prices were made for suitable securities not appearing in a published list. Since it was essential for the Treasury to obtain the largest possible credits in New York at the earliest possible date negotiations were entered into with large holders of securities, and bulk prices were quoted for large and comprehensive blocks.

The scheme was successful from the outset, as will be seen from the fact that securities to the value of over £40,000,000 sterling were obtained in the first ten weeks of its operation.

During the first months of the Committee's existence no securities had been taken on loan, but towards the end of March 1916 a deposit scheme, subsequently known as scheme A, was introduced. Briefly the scheme was as follows:—

Securities were to be deposited for a period of two years from the date of deposit, the lender to receive all interest and dividends on the securities deposited by him, plus an additional ½ of 1% per annum on the nominal amount. During the currency of the loan the lender was entitled (1) to have his securities sold in New York free of expense, the proceeds being paid to him in London at the current sterling rate of exchange, or (2) to obtain the release of his securities in New York against payment to the Treasury agent there of a sum in dollars equivalent to their American value, a similar sum in sterling being paid to the depositor in London.

The Treasury was also prepared in most instances to purchase for sterling the deposit certificates in London at the current American prices of the securities deposited. Though there was no intention to realize the deposited securities except in an emergency, the right to do so was reserved to the Treasury as otherwise the securities would have been useless as collateral for loans in New York.

In Aug. 1916 a further loan scheme, B, was brought into force. It differed from the previous scheme in that (1) deposit was for a period of five years from a fixed date, instead of two years from the date of deposit; (2) under it were included many colonial and foreign stocks and bonds in addition to the purely American securities; and (3) the right to realize securities as given under scheme A was limited to American securities having a market value in New York. Power was given to depositors under scheme A to transfer to scheme B, and this option was in most cases exercised.

The securities purchased were sold immediately a suitable opportunity offered, and those remaining unsold, together with deposited American dollar securities, were used for short borrowing as required. The main use, however, to which the deposited securities were put is illustrated by the particulars of a typical loan floated in the United States of America prior to the entry of that country into the war:—

UNITED KINGDOM *3-5 year 5½% Notes Dated Nov. 1 1916.*

Amount of loan		$300,000,000
Collateral		360,000,000
Composed of $	59,500,000	Australasian.
	25,500,000	South African.
	20,000,000	Argentine and Chilian.
	30,000,000	Japanese.
	15,000,000	Egyptian.
	5,000,000	Cuban.
	25,000,000	British Railway Debentures.
	180,000,000	U.S.A. dollar securities and Canadian.

Up to May 27 1916, rather less than five months after the formation of the Committee, the amount paid for securities purchased exceeded £51,000,000 sterling, while the nominal amount of securities deposited on loan was about £8,000,000. Since these figures, however, were not sufficient to provide the funds required, the Chancellor of the Exchequer stated in Parliament that powers would be taken to impose a special tax of 2s. in the £1 on the income of all securities that the Treasury, by means of special lists, declared its willingness to purchase. The necessary authority of Parliament was granted. Relief from the additional tax was only obtainable by selling or loaning the specified securities to the Treasury. The effect was immediate. In the first two weeks following the announcement the purchases exceeded £23,000,000 sterling and the deposits £15,000,000 sterling. In course of time the purchases greatly decreased but the deposits, mainly owing to the introduction of scheme B, assumed very large proportions. For example, during the month of Sept. 1916, the securities taken in on loan amounted to about £100,000,000. The enormous requirements of the Treasury are

emphasized by the fact that in spite of the large amounts of securities purchased and deposited a still more drastic step had to be taken.

On Jan. 24 1917, a regulation issued under the Defence of the Realm Act came into force, by which the Treasury was given power to requisition securities. The first order under this regulation was issued on Feb. 17 1917, and required owners or custodians of specified securities to deliver them up in return for an amount of compensation based on the current market values. Holders of securities not ordinarily resident in the United Kingdom and certain other holders were exempted from the terms of the order. The compensation was payable within seven days of the transfer, and power was given to reduce its amount in case of late delivery. Altogether four such orders were issued, the number of securities included being 1,076. On March 1 1918 deposit scheme B was closed to new deposits, except in regard to securities subject to the extra 2s. tax and which had not previously been included in the list of requisitioned securities. A little later, when the securities under scheme A began to fall due for return, depositors were given the option to extend the term to five years. Nearly all such depositors availed themselves of this offer.

In addition to the purchase and loan schemes which have been described above, the American Dollar Securities Committee undertook various operations for the purpose of placing dollars at the disposal of the Treasury in America. In this connexion may be instanced arrangements with various Canadian provincial and municipal authorities for the purchase of their sterling securities in London for cancellation and the issue, in place thereof, of Canadian dollar securities for sale in America. Similar plans were adopted in the case of certain American industrial companies. Further, arrangements were made with certain British corporations to issue their own loans in America and place the dollars obtained at the disposal of the Treasury, the latter looking after the American loan and providing the English company with sterling in London. As an instance, reference may be made to the issue by the Central Argentine railway of a $15,000,000 loan in America.

The labour involved in connexion with the operations and more particularly with the loan scheme, was of considerable magnitude, and it was necessary to adopt every device in order to lessen the work, which in the main had to be carried out by a staff collected in a time of emergency. In the early days an agreement was entered into with the agents of over £100,000,000 bearer securities, the coupons of which had to be encashed in London, to pay the coupons on deposited securities, plus the additional ½% per annum, and for this purpose they were supplied with schedules giving such information as would permit of the calculations and payments being made. In Sept. 1917 this procedure was discontinued, and thereafter the work was taken over by the National Debt Office.

With regard to the registered stocks on deposit, much duplication of work was avoided by the railway companies and other paying agents undertaking to keep the Treasury register and pay the increased interest as it fell due. By this means it is estimated that the authorities were relieved from the preparation, etc., of about 350,000 dividend warrants each year. Further, certain approved agents were appointed to accept deposits of amounts of less than $5,000 each, the securities being handed over in bulk to the Committee; payment of interest on the aggregate amounts was made to such agents, who in turn distributed the sums received amongst the individual depositors.

The United States of America was naturally the chief source of supply, both for munitions of war and for goods, and therefore the financial arrangements already referred to were mainly directed to the provision of dollars in order to effect the necessary payments. In a smaller degree, however, payments had to be made to other countries, and certain of the securities obtained by the Committee were used to meet these obligations.

The United Kingdom was, of course, preëminent as the holder of foreign securities, and she therefore played by far the greater part in the efforts made towards mobilization in the Allied interests. But France also held a considerable amount and had a deposit scheme of her own, though on nothing like the same scale as that of the United Kingdom. In her scheme no purchases of securities were made, but a considerable volume of private sales to the United States of America was effected, both direct and through London, and to a certain extent purchases of French holdings were made by the American Dollar Securities Committee through the medium of the banks of France and England.

The total amount of securities dealt with under the British mobilization scheme, including those bought by the Bank of England prior to the appointment of the American Dollar Securities Committee, was as follows:—

Purchases	£216,000,000
Deposits	£406,000,000
Total	£622,000,000

These particulars may be to some extent amplified. Thus, the purchases consisted of:—

$680,000,000	Dollar bonds
$241,300,000	Dollar shares
£ 27,800,000	Sterling bonds and shares
£ 4,100,000	Registered stocks
Fl. 5,400,000	Florin bonds and shares

Similarly the deposited securities were made up of:—

$197,800,000	Dollar bonds
$303,600,000	Dollar shares
£115,100,000	Sterling bonds
£172,000,000	Registered stocks
£ 17,500,000	Home Railway debentures
Fr. 8,500,000	Franc bonds
Kr. 8,100,000	Kroner bonds
Fl. 4,400,000	Florin bonds

The total number of different securities dealt with was 2,027.

The total amount of American dollar securities which passed through the hands of the Committee was thus approximately £285,000,000. In addition securities to the value of probably £100,000,000 were sold direct to America through the ordinary channels, making in all, say, about £400,000,000. Various estimates have been made from time to time of the amount of American securities held in Great Britain before the war. The data available on which to base any such estimate are very vague and uncertain in their nature, and the present writer is inclined to believe that any such estimates can only be regarded as more or less intelligent guessing. In his opinion the total amount of American securities held in Great Britain before the commencement of hostilities was certainly not greater than £600,000,000 and probably nearer £500,000,000.

The operations of the Committee undoubtedly achieved the purpose for which it was formed, as during its existence the rate of exchange practically remained constant at about 4.76¼ dollars to the £1. Although securities were purchased and taken on loan after the Americans came into the war the amounts obtained were not great, and it is believed that practically all available American securities suitable for sale or collateral for loans had been dealt with.

It is difficult to see what course could have been taken in order to obtain the necessary credits abroad in sufficient amount when these securities had been exhausted, but speculation on this point would be idle since the necessary credits became available after and on account of the entry of the Americans into the war. (G. E. M.)

DOLLAR STABILIZATION.—Under the existing currency system, the so-called "level of prices" is largely at the mercy of monetary and credit conditions. The tide of prices will rise or fall with the flood or ebb of gold or of paper money or of bank credit. Evidently a rise in the level of prices is a fall in the purchasing power of the dollar or other monetary unit, and *vice versa*. The purchasing power of money has always been unstable because a unit of money, as at present determined, is not a unit of purchasing power, but only a unit of weight. It is the one inconstant unit of measurement left in civilization. Other units—the yard, pound, bushel, etc.—were once as unstable and crude as the dollar, sovereign or franc still are; but, one after another, the other units have all been stabilized or standardized. Short weights and measures cheat the buyer; long weights, the seller. So a unit of money which changes in value or purchasing power is always playing havoc between contracting parties. When prices are rising—in other words, when the purchasing power of the dollar is falling—the creditor and the creditor-like classes suffer injustice. The sufferers include savings-bank depositors, bondholders, salaried classes and wage-earners. In the great upheaval of prices—*i.e.* in the United States, depreciation of the dollar—which took place between 1896 and 1921 such injustice amounted to over a hundred billion dollars. On the other hand, when prices fall, as they did between 1873 and 1896, it is other classes—debtors, stockholders, farmers and independent business men generally—which suffer the injustice. The indirect effects of falling or rising prices—*i.e.* of a rising or falling dollar—are equally bad. These indirect effects include industrial discontent

(either over the "high cost of living" or unemployment) and economic crises and depressions.

Hitherto there was ample excuse for the unstable monetary units of various countries. No instrument for measuring their aberrations had been devised. Likewise, until weighing scales were devised, weights could not be standardized, and until instruments for measuring electrical magnitudes were invented, electrical units could not be standardized. But for many years the "index number" of prices has provided an accurate instrument for measuring the value of the dollar in terms of its power to purchase goods. An "index number" of prices is a figure which shows for a specific period of time the average percentage increase or decrease of prices. One of the most suggestive signs of the times is that this instrument for measuring changes in the purchasing power of money has recently been utilized in adjusting wages and salaries to the high cost of living, *i.e.* to the depreciated dollar. A number of industrial concerns and banks, and some official agencies, have amended wages by the use of an index number of the prices of commodities.

It has been contended by some economists that this principle may be utilized in the future more generally to safeguard agreements made at one date to pay money at another date. Such corrections of the dollar would gradually break down the popular superstition that "a dollar is a dollar"; for every time we correct the dollar, we convict it of *needing* corrections; and ultimately the correction might be applied, not, as at present, as a patch on the dollar from the outside, but by incorporating it in the dollar itself. Various methods for accomplishing this have been proposed. The one perhaps best known is Prof. Irving Fisher's proposal to vary the weight of the gold dollar so as to keep its purchasing power invariable. Instead of a gold dollar of constant weight and varying purchasing power, what is needed, he contends, is a dollar of constant purchasing power, and, therefore, of varying weight. It is not proposed, of course, to remint gold coins, but simply to count an ounce of gold bullion as being the equivalent not always of $20.67 (as at present) but of as much more or less than that sum as is required from time to time in order to keep the purchasing power of the dollar constant. In other words, the proposal is to vary the price of gold according to its worth relative to other commodities, instead of, as at present, keeping it artificially constant at $20.67 an oz. pure or £3 17s. 10½d. an oz. 11/12 fine. In this way, Professor Fisher contends, we can control the price level, lowering it, raising it, or keeping it from fluctuating much, if at all. Thus, if Mexico should adopt the dollar of the U.S. (instead of its present dollar of half the weight of gold), the price level in Mexico would be disastrously cut in two. Again, if the U.S. should adopt the Mexican dollar, the price level in the U.S. would be disastrously doubled. That is, the more gold in the dollar, the greater its buying-power; and the less, the less. If, Professor Fisher contends, this principle be admitted, it follows that we hold, in the hollow of our hand, what the dollar's buying-power shall be—that is, what the level of prices shall be. It can be kept from changing greatly just as easily as it could be made to change, simply by periodical adjustments of the price of gold, each adjustment being made in accordance with the index number of prices. By this method, in conjunction with any of the sound systems of banking, Professor Fisher contends, variations of more than one or two per cent could easily be prevented except under the most extraordinary conditions. (I. F.)

DONALDSON, SIR JAMES (1831–1915), British scholar (*see* 8.406), died at St. Andrews, March 9 1915.

DONNAY, CHARLES MAURICE (1859–), French dramatist (*see* 8.417), wrote several fresh plays after 1910: *Le Ménage de Molière* (1912); *Les Éclaireuses* (1913); *L'Impromptu de Paquetage* (1916); *Le Théâtre aux armées* (1916). He also published some war-time essays and addresses: *La Parisienne et la Guerre* (1916); *Premières Impressions après* (1917); *Lettres à la Dame Blanche* (1917); *Pendant qu'ils sont à Noyon* (1917); *La Chasse à l'Homme* (1919).

DOUGHTY, CHARLES MONTAGU (1843–), British explorer and writer, was born in 1843, the youngest son of the Rev. C. M. Doughty of Theberton Hall, Suffolk. In 1875 he made an adventurous journey through northern Arabia, remaining nearly two years in the country, and, after many hazards and hardships, finally emerging at Jidda (*see* 2.257). He published the results of his observations in a work since recognized as a classic worthy to rank with the records of the Elizabethan voyagers. *Travels in Arabia Deserta*, issued by the Cambridge University Press in 1888, received at first little recognition and brought its author no material reward. But gradually its fame spread amongst travellers and lovers of literature until the rare copies of the first edition were scarcely procurable at any price, and in 1921 a facsimile reprint of the two volumes was issued at £9 9s. The value of Doughty's work as a traveller had by that time secured universal recognition; nothing was left for any future explorer to study between Damascus and Mecca which Doughty had not already closely studied, and in 1912 the Royal Geographical Society bestowed on him its Founder's gold medal. He had done other work previously, and he published several volumes; but he remains, in the estimation of the literary world, the author of one book. It should, however, be noted that in 1866 he brought out *On the Jöstedal-Brae Glaciers in Norway*, and a collection of inscriptions copied by him in Arabia was published by the Académie des Inscriptions et Belles-Lettres in 1884. His later years were devoted to poetry and poetic drama. In 1906 he published an epic in six volumes *The Dawn in Britain*, followed by *Adam Cast Forth* (1908), *The Cliffs* (1909), *The Clouds* (1912), *The Titans* (1916) and *Mansoul, or the Riddle of the World* (1920).

DOVER, England (*see* 8.453).—Pop. (1911), inclusive of the garrison, 43,645; estimated civil pop. (1920) 41,408. The municipal boundaries were extended in Nov. 1921 so as to include an area of about 70 ac. in the River Ward destined for housing purposes; at the same date the various piers and jetties of the harbour were brought within the municipal area. A new general post-office was completed in Biggin St. in 1914. Two new churches have been erected—Charlton church, a large building in the early English style which takes the place of a small church dating back to the Middle Ages since demolished, and St. Barnabas church, built between 1890 and 1912. The Duke of York's Royal Military School was transferred from London to Dover in 1907, an extensive series of buildings of the bungalow type having been erected on the Eastern Heights near Fort Burgoyne. The Connaught barracks near the castle with accommodation for an infantry battalion were completed in 1915. The Dover Patrol memorial obelisk on the cliffs E. of the town was unveiled by H.R.H. the Prince of Wales on July 27 1921.

The Dover harbour scheme—in addition to the construction of piers and a breakwater to enclose the Admiralty harbour with a perimeter of about 4¼ m., completed in 1909—included the reclamation of about 11⅓ ac. upon the harbour (eastern) side of the Admiralty pier, to provide for a new marine station and berths for the continental mail packet steamers and other vessels. Both these projects were sufficiently completed in time to be of service during the World War.

The reclamation wall is 2,260 ft. long, and the landing-stage upon the Admiralty pier extension, 792 ft. long and 20 ft. wide. Altogether six berths are provided. The stage is built on open pile work and double decks to suit levels for the passenger steamers—spring tides rise 18 ft. 9 in., neap tides 15 ft., and range 11 feet. Reinforced concrete piles support the foundations of the passage to an inset landing-stage, and also the foundations of the marine station. At the outer end is a lighthouse 85 ft. above high-water level, the light visible for 14 miles. As at Chatham, large colliers drawing four fathoms can berth alongside the pier to unload into railway trucks.

To provide railway communication to the Prince of Wales' pier, and to the harbour quays, the Harbour Board, in 1904, constructed a new swing bridge to carry passenger trains as well as ordinary vehicular traffic; during the war this bridge proved indispensable in the transport of material.

The Harbour Board acquired parliamentary powers, in 1920, to construct, by arrangement with the Government, an enclosed wet-dock upon the Admiralty harbour side of the Prince of Wales' pier, having an area of 34 ac. and depth of 34 ft. at high-water of spring tides. The entrance lock is to be 100 ft. wide, and additional quays, transit sheds, coal-tips, and connexions to the inner dock basins will be provided.

On its completion, the Admiralty harbour became the base of the battleships and armoured cruisers of the Atlantic Fleet. In 1911 the defence of the Straits was handed over to the destroyers and submarines and a camber in the northern corner of the harbour was completed for them just before war broke out. In Aug. 1914 the Sixth Flotilla of destroyers and submarines formed the naval force guarding the Straits, with their base at Dover.

During the war Dover was entrenched, the perimeter being nearly 6 m., and a division of troops manned the defences. The Swingate aerodrome was an instructional school for the final training of officers before leaving for France, and the Guston aerodrome the H.Q. of the R.N.A.S., afterwards the R.A.F. Dover was subjected to repeated air raids, the first raid on England taking place at Dover on Dec. 24 1914. There were several Zeppelin raids in 1915–7, but the defence prevented any serious damage. In all, 184 bombs were dropped on the borough and 370 in the immediate vicinity, and the total death toll was 25. The castle was hit several times by bombs but beyond a few chips in the walls of the keep no trace of damage remains. Over 100 men lost their lives in the blowing up of the monitor "Glatton" in Dover harbour on Sept. 16 1918, and 155 were drowned in the mining of the "Maloja" off Dover on Feb. 24 1916.

At the close of the war Dover harbour was abandoned as a naval base, the camber was leased to a private company for the breaking up of old battleships, and the Admiralty in 1921 were offering to lease the naval harbour for commercial purposes.

Dover castle has been placed in the care of the Office of Works as an ancient historical building and a considerable amount of restoration and preservative work has been carried out on the Roman pharos and the late Norman towers and walls. In recent years many tiles bearing the letters Cl Br have been found in the area between the Western Heights and the Dour, indicating that Roman Dover occupied this site. The tiles show from their stamp that they were made by artisans belonging to the Roman British fleet. As they have not been found elsewhere except at Boulogne, they appear to indicate that Dover was the chief Roman port to the continent.

The chief feature of the industrial development in the district was the opening up and working of the Kent coal-field. The H.Q. of the chief colliery company is at Dover.

DOWDEN, EDWARD (1843–1913), English writer (*see* 8.456), died at Dublin April 4 1913.

See his *Letters*, edited by E. D. and H. M. Dowden (1914).

DOYLE, SIR ARTHUR CONAN (1859–   ), English novelist (*see* 8.461), was one of the originators of the Volunteer Corps during the World War, the first corps being formed by him at Crowborough, Sus., in Aug. 1914. In this, the 6th Sussex Batt., he served for four years as a private. He also did much propaganda work, and issued various pamphlets on war subjects, also a six-volume history of the war which was extensively read in America. He visited the war zones twice, and published *The British Campaign in France and Flanders, 1914* (1916) and *A Visit to Three Fronts* (1916), as well as a volume of verse, *The Guards Came Through, and other Poems* (1919). His other writings since 1910 include *The Case of Oscar Slater* (1912); *The Poison Belt* (1913); *Danger* (1918) and *His Last Bow* (1918). He became an ardent spiritualist and published *A New Revelation* (1918) and *The Vital Message* (1919), following these up by an active campaign of lecturing and controversy on the possibility of proving by spiritualism the continued existence and conditions of human life after death. A public debate between him and Joseph McCabe on the subject took place in 1920.

DRAMA (*see* 8.502).—The decade 1910–20 was one of paramount importance in the history of English drama and the English theatre. Apart from the temporary, but substantial, effect of the World War, which lasted for nearly half of the decade, other causes of wide influence profoundly affected both the drama as a part of literature and the theatre as a commercial organization during that period. In the United Kingdom great changes in the constitution of theatrical enterprises were brought about abruptly and almost catastrophically. The government of the theatre by actor-managers ceased with dramatic suddenness and was replaced by the government of syndicates composed, for the most part, of persons innocent of all knowledge of acting or drama and concerned primarily, if not exclusively, with the production of large profits quickly returned. In those theatres where the actor-manager was not replaced by a commercially minded syndicate, his place was taken by what may be called the producer-manager.

The three great actor-managers of the English theatre, Sir Herbert Beerbohm Tree, Sir George Alexander and Sir Charles Wyndham, did not outlive their reign; the era of the actor-manager ended simultaneously with their decease. Tree died July 2 1917; Alexander March 16 1918; and Wyndham Jan. 12 1919. The normal process of nature, whereby one generation or tradition is slowly merged in another, was in their case mercifully suspended. In 18 months the actor-managerial system, which had been immensely powerful, was in ruins, and its chief protagonists, men of ability and taste, were dead, spared from the humiliation of neglect and supersession. It was a system undeniably disadvantageous to the drama as an art, since it tended to make the play subordinate to the player and restricted many dramatists to the production of plays with good parts for particular persons, but there is no doubt that the actor-managers, especially the three named, were possessed of ambition and much taste and that they worked successfully to restore dignity to the theatre. They were directly associated with many of the most interesting plays that were written during their reign, and Tree, Alexander and Wyndham could claim exemption from the charge so frequently and justly brought against Sir Henry Irving, of doing nothing whatever to encourage the work of meritable modern English dramatists. Sir Herbert Tree's annual Shakespearean festival, held often at grave financial disadvantage to himself, was a real tribute to taste and culture, despite the serious complaints fairly made about his methods of production. Sir George Alexander, more than anyone else, made the way to the stage easy for the writer of distinguished comedy and was chiefly responsible for the career as a dramatist of Oscar Wilde. Sir Charles Wyndham, less consistently ambitious than his colleagues, followed an honourable tradition and was responsible for the redemption of farce from buffoonery.

The decline and fall of the actor-managerial system coincided with the disappearance from the centre of London of the music-hall in which a succession of "turns," sparely produced but highly individualized and having no relationship with each other, formed the programme. Three well-known music-halls ceased between 1910 and 1920 to be music-halls. These three, the Oxford, the Tivoli and the London Pavilion, were the centre from which radiated an elaborate ganglion of music-halls throughout Great Britain and Ireland. The Tivoli was demolished and its site remains, in 1921, unoccupied. The Oxford became, during the war, a theatre and in 1920, under the managership of C. B. Cochran, was re-named the New Oxford, where an elaborately produced but less highly individualized form of music-hall entertainment, roughly connected in shape, was provided. At the London Pavilion, also controlled by Mr. Cochran, a skilfully contrived form of what is called "revue" became the standing entertainment. Specific reference to "revues" will be made later, but here it may be said that they are not "revues" in the French sense, a commentary on contemporary affairs, but a mingling of musical comedy and music-hall entertainment in which individual ability is made subordinate to general impression. The chief characteristics of this new entertainment, seen perhaps at its best in the roof-garden productions in New York, are expensive dresses, handsome scenery, fine and even beautiful effects both in grouping and lighting, and a particular insistence on feminine beauty.

This change in the character of the London West End music-hall coincided with the great growth in popularity of the kinema,

or picture-palace, or "movies." During the decade, almost all of the London suburban theatres became picture-palaces. Many of the provincial theatres, especially in small towns, also became picture-palaces. A variety of reasons caused this change to take place, some of which were financial and others connected with altered taste. The kinemas were at once cheaper and more comfortable than the theatres and they offered a more consistently attractive programme. The inhabitants of a London suburb or a small provincial town were able to see as good a film at the local kinema as could be seen in a kinema in the centre of London, but they could not hope to see a play performed at the local theatre by a company as capable as that acting in the same play in the West End. On the contrary, they might expect with certainty to witness a very inferior exhibition of acting. Precisely the same process was observable in America, where, owing to the competition of the "movies" and the inferior quality of travelling companies, what were known as "one-night stands" ceased to be profitable enterprises and were almost entirely abandoned.

Those were the three main changes in the nature of theatrical entertainment during the decade 1910–20; the disappearance of the actor-manager and the substitution for him of the commercial syndicate; the disappearance from the centre of London of the music-hall of marked personality and the substitution for it of the music-hall with elaborate effects and mechanical skill; and the collapse of the suburban and provincial theatre before the advancing kinema. These changes, although they hardly cause satisfaction, are of the nature of constructive changes, and they probably possess permanent characteristics. The commercial syndicate may result in more efficient administration in the theatre and a greater likelihood of continuous employment for the actor. It has not yet shown a desire to produce drama equal in merit to that produced by the actor-manager, but the system is still young and it was considerably handicapped by its inauguration during the war and remains handicapped by the high cost of production. The great virtue of these syndicates is likely to be of an administrative character. Many theatres, in London and the provinces, are coming under the control of a single syndicate, and this trustification of theatres will enable a particular firm to arrange its tours on a more economical and comfortable system than has hitherto been the case. The old individual system unavoidably resulted in touring companies sometimes spending a week in Edinburgh, the next week in Bristol and the third week in Newcastle-upon-Tyne. In a properly organized theatrical system, such tours will no longer take place, but will be arranged so that the journey from town to town will be short and easily accomplished by motor-car or lorry.

The change in the music-hall has brought about a great development of the mechanical and pictorial side of that entertainment, and if some of the spirited personality of the superseded form can be captured for the new form, the change will be of considerable value. The danger of it is that human qualities are subordinated to machinery and spectacular effects. In the case of the kinema development has been progressive and is likely to continue so. Film-manufacturers are constantly engaged in experiment, and they will in time invent a machine which will enable them to exhibit pictures in three dimensions, in natural colours and with some effect of the human voice. This will be done by means of an instrument which is a combination of gramophone and stereoscope, aided by some process of colour-photography. The film-firms, particularly in America, are endeavouring to improve the quality of the film-play and, since they offer very handsome monetary rewards to authors, are likely to succeed in their attempt. Many of the most distinguished dramatists of the world are engaged in writing scenarios for the "movies," and several of them have announced that they will in future write only for them.

Repertory Theatres.—The survey in the earlier article (*see* 8.475) ended at a period when, in spite of many undesirable things, the drama was in a healthy condition. Plays of merit were being written and produced, not only in London, but also in the provinces where the activities of the repertory theatres were stimulating the imagination of young authors. Conservative managers were receiving original work with less hesitation or hostility than had been accorded to it for several generations. The long and, in many respects, valuable domination of the theatre by dramatists such as Sir Arthur Pinero and Henry Arthur Jones, was declining before the rising authority of such dramatists as Bernard Shaw and John Galsworthy. The repertory theatres were increasing in number. In 1910, there were three repertory theatres in the British Isles, one in England (the Gaiety theatre, Manchester, owned by Miss A. E. F. Horniman), one in Scotland (the Royalty, directed by Alfred Wareing) and one in Ireland (the Abbey, directed by Lady Gregory and W. B. Yeats). The last was the oldest as it has proved to be the most durable of the three. In addition to these three repertory theatres, there was a most ambitious attempt to establish one in London, at the Duke of York's theatre, where the late Charles Frohman (who was drowned in the "Lusitania" when it was torpedoed by the Germans May 7 1915) enlisted the services of Harley Granville-Barker and Dion Boucicault. The scheme was to establish a repertory theatre more nearly corresponding to the strict definition of one than any of those operating in the provinces, which were identical with what used to be called "stock" companies. Mr. Frohman's gallant enterprise failed. It lasted for 17 weeks, from Feb. 21 to June 17 1910, and during that period eight new plays and two old ones were produced. The names of the plays and their authors are as follows:—*Justice* by John Galsworthy; *Misalliance* by Bernard Shaw; *Old Friends* by J. M. Barrie; *The Sentimentalists* by George Meredith; *The Twelve-Pound Look* by J. M. Barrie; *The Madras House* by H. Granville-Barker; *Helena's Path* by Anthony Hope and Cosmo Gordon-Lennox; *Chains* by Elizabeth Baker; *Trelawney of the Wells* by A. W. Pinero and *Prunella* by H. Granville-Barker and Laurence Housman. Three of these plays were in one act (the third, fourth and fifth in the list).

The original scheme, of a strictly repertory theatre similar to the Comédie Française, was not maintained, nor does the history of the repertory theatres in Great Britain and Ireland indicate that such a scheme is ever likely to succeed in a country where the people are disinclined to make the research through newspaper advertisements which a programme of irregular performances involves. For good or ill, the system of continuous performances has obtained a hold on the British theatre which will not easily be shaken off and may never be shaken off. *Trelawney of the Wells,* the most popular of the plays produced during the season, was performed 42 times in a season of 17 weeks, which clearly signifies that the promoters of the scheme had to revise their plan, partly to satisfy the public demand and partly to recoup themselves for the losses sustained on the unpopular pieces. A similar history has attended the establishment of other repertory theatres on Comédie Française lines in England, for example the Everyman theatre at Hampstead, established in 1920 by Norman MacDermott. The repertory theatres steadily increased in number until, at the outbreak of the World War, there were seven of them operating regularly and a number of others operating for short periods during each year. None of these theatres earned large sums of money. Some of them, indeed, were constantly embarrassed by insufficient funds. But they performed a most valuable service to young actors and young dramatists: to the first, by giving them continuous and varied employment which, although not highly remunerated, enabled them to become accomplished in their craft; to the second, by giving them the greatest of all instruction to a dramatist, the public performance of his work, and by bringing before them the work of established dramatists, British and foreign, which otherwise they would not have known except in book form. Ibsen, Strindberg, Hauptmann, Schnitzler, Maeterlinck, Rostand, Verhaeren, Sudermann, Tolstoi, Chekhov, Shaw, Galsworthy, St. John Hankin, Granville-Barker, Arnold Bennett and John Masefield among the moderns; and Euripides, Shakespeare, Ben Jonson, Congreve, Beaumont and Fletcher, Goldsmith and Sheridan among the classics—the work, in quantity, of all these writers was brought to the knowledge and even to the intimacy of provincial playgoers who, but for the repertory theatres, would have had to subsist in the theatre on the more popular of the pieces produced in London and sent on tour. A similar service is performed in America by what are called "little" or "community" theatres.

Out of these repertory theatres came a number of young dramatists, many of them resident in the city in which their plays were first performed, of whom at least one man was a genius, John Millington Synge (d. 1909) and three men of distinction, Stanley Houghton (d. 1913), John Drinkwater (b. 1882) and Lennox Robinson (b. Oct. 4 1886). Synge has been the subject of several biographies of which the principal and most authoritative one is *John Millington Synge and the Irish Theatre* by Maurice Bourgeois. He wrote six plays, a book of poems and translations and some impressionist articles of a newspaper character. Two of the plays are in one act, *In the Shadow of the Glen* and *Riders to the Sea.* The latter is commonly regarded as the best of his work. One of the plays, *Deirdre of the Sorrows,* is unfinished. Of the remaining three, *The Tinker's Wedding* (in 2 acts), *The Well of the Saints* (in 3 acts) and *The Playboy of the Western World* (in 3 acts), the last-named is the most widely known, partly because of its merits, but chiefly because of the anger which it aroused among the more sentimental of the Irish people who, accustomed to the romantic delusions in which subject or oppressed peoples live, could not endure the romantic realism of this play. A long succession of poets had insisted on one aspect of the Celtic

character, its idealism and generosity and romance, with the result that people disbelieved in the other aspect of it, the cruelty and greed and treacherous materialism. Synge, a man without prepossessions or creed, set down what he saw in words of acrid beauty, and the Irish people, horribly shocked, pronounced him to be a liar, a degenerate and even a traitor. The violence of their anger against *The Playboy of the Western World* died down in time, but Synge remains a man of genius of whom his countrymen, when they take pride in him at all, remain reluctantly proud. He and Lennox Robinson are the principal products of the Abbey theatre, Dublin, which includes among its minor dramatists Lady Gregory, William Boyle, T. C. Murray, Padraic Colum, the late Seumas O'Kelly and St. John Ervine. W. B. Yeats has written plays for the Abbey theatre, but the dramatic form is intractable in his hands.

Lennox Robinson, who was appointed manager of the Abbey theatre in 1910, at the age of 23 and, except for a break of two or three years, has managed it ever since, has written nine plays, of which two, *The Lost Leader* and *The White-headed Boy*, have been successfully performed in London. The first was produced at the Court theatre June 10 1919, where it was acted 68 times. The second was produced at the Ambassadors' theatre Sept. 27 1920, and was acted for more than 300 times. His plays conform more closely to the conventional shape than do those of John Drinkwater, and they are more skilfully contrived than those of Stanley Houghton. He puts realistic, rather than romantic, speech into the mouths of his people, thus separating himself very distinctly from the Synge drama. His principal merits are great technical skill, veracity of character and speech, and natural exploitation of natural emotions. His defects are a lack of staying power and vagueness of thought, which causes his last act to drop considerably below the level of his first. But of all the Irish dramatists, he has the greatest comprehension of the theatre.

Stanley Houghton, after writing a number of meritable pieces of uninspired realism, presented the Gaiety theatre, Manchester, with a comedy in three acts, entitled *Hindle Wakes*, which, to fill an emergency, was first performed before the Stage Society June 16 1912. It made an immediate impression and was put into the evening bill at the Playhouse and afterwards at the Court, receiving in all more than 100 performances in London. It had greater success in the provinces, where at least one company has performed it ever since, but it failed to be popular in America. *Hindle Wakes* is not a profound play, nor has it conspicuous literary qualities; but it is fresh and forceful and it deals with a question of sex in a direct, natural and sincere, but unusual, manner. Whether or not Houghton would have grown into a dramatist of distinction (he was 32 when he died) is not a matter which can profitably be discussed. The plays which came after *Hindle Wakes*—*The Perfect Cure* and *Trust the People*—did not sustain the reputation it had made for him, but as they seemed to be written deliberately for commercial purposes and failed to realize them—*The Perfect Cure* was performed for four nights only—it is probable that Houghton would have returned to the milieu in which he was happiest and that, although he was unlikely ever to become a first-rate dramatist, he would have become a very competent and meritable one. The Gaiety theatre, Manchester, gave opportunity to a number of other dramatists, of whom the principal are Harold Brighouse and Allan N. Monkhouse, the first-named being the author of *Hobson's Choice*, which had great popularity in America and London, and the second-named the author of *Mary Broome* and *The Education of Mr. Surrage*.

John Drinkwater is the product of the Birmingham Repertory theatre (founded in 1913 by Barry V. Jackson) of which for several years he was both manager and play-producer. He had already earned reputation as a poet, critic and dramatist when his historical play in five scenes, *Abraham Lincoln*, was first produced. This play, influenced by the form of Thomas Hardy's *The Dynasts*, is written in prose, but the scenes are separated by a Chorus who speaks in verse. It was produced for the first time at Birmingham Oct. 12 1918, and afterwards at the Lyric opera house, Hammersmith, Feb. 19 1919, where it was performed for exactly one year. Much doubt was felt about the reception the play was likely to receive in America, but this doubt was dispelled when, Dec. 15 1919, it was produced at the Cort theatre, New York, where it was continuously performed for nine months. *Abraham Lincoln* will probably be performed throughout the United States for many years and has given a great impetus to the production of serious historical plays in America. Percy Mackaye, an American poet, wrote a pageant play on George Washington, at the request of President Wilson, but this piece was not a success when produced in New York. Other plays on Lincoln have been written since the production of Drinkwater's play, but the latter, which was derived, so far as its main facts are concerned, from Lord Charnwood's biography of the great President, is indisputably the best of them. The play is simply and directly written, in spite of its remarkably long cast, and its emotional quality is very high. Part of its appeal to the British people is probably due to the fact that Drinkwater with extraordinary skill has unobtrusively drawn a parallel between the circumstances of the Civil War and the World War, and many of the great crowds who saw it performed in London must have been more conscious of the war from which the world had just emerged than they were of the war which had been so fiercely fought in America 60 years earlier. This was the first of a series of historical plays planned by Drinkwater, of which two others, *Oliver Cromwell* and *Mary, Queen of Scots*, have already been written. The latter was produced for the first time at the New Ritz theatre in New York March 21 1921, with Clara Eames in the title part. It is interesting to observe that Lennox Robinson and John Drinkwater have followed faithfully in the footsteps of such dramatists as Shakespeare, Molière and Ibsen by being practical theatre managers and producers and even, as in Drinkwater's case, an actor.

The "Intellectual" Drama.—The record of the English repertory theatres up to the time the World War began was honourable and promising. We have now to consider the record of the ordinary commercial theatre, and here we discover that the standard of plays produced had been greatly raised. The authority of Sir Arthur Pinero and Henry Arthur Jones, already diminished by the work of Oscar Wilde, was now yielding to that of Shaw and Sir James Matthew Barrie and John Galsworthy. A number of young dramatists of varying quality were appearing, whose allegiance was more definitely given to the school led by Shaw than to the school led by Sir Arthur Pinero, and these included Granville-Barker, the late St. John Hankin (d. 1909), Charles McEvoy, Arnold Bennett, John Masefield, Cicely Hamilton, Githa Sowerby and Elizabeth Baker. What was called the "intellectual" drama seemed to be established not on a broad basis, but on a basis sufficiently wide to make it steady. Shaw and Bennett were even able to obtain long "runs" for their plays, and Cicely Hamilton made a popular success with *Diana of Dobson's*. It is true that the "intellectual" drama did not make fortunes for its producers, but it is true also that it did not cause any bankruptcies, and probably, if an accurate statement of accounts could be prepared, the "intellectual" drama would be found to have caused less loss of money, relatively and absolutely, than the commercial drama. It might even be found to have paid its way. Following on the heels of the "intellectual" dramatists cited above came still younger dramatists, also of the school led by Shaw, whose intellectuality was perhaps less arid or severe, and these young dramatists contrived to write plays definitely of the "intellectual" school which made much profit for those who produced them. They have already been named in connexion with the repertory theatres. Their lack of aridity is due, possibly, to the fact that the stage is their first concern, whereas most of the generation between them and Shaw came to the theatre from the novel and the sociological survey.

Outside the "intellectual" or "highbrow" school, in what is called the commercial theatre, there was observable a great increase in the quality of the plays produced. The younger dramatists who were without any intellectual pretensions were indirectly affected by the work of Shaw, even when it was repudiated by them. Plays by Hubert Henry Davies, Rudolf Besier, Alfred Sutro, Bernard Fagan, Somerset Maugham and J. E. Harold Terry were notably better in quality than plays written by their predecessors at any time during the century immediately preceding their appearance in the theatre. The work of Besier in *Don* and *Lady Patricia* had a flavour of letters and a technical excellence which made it appear almost equal to the best work of Sir Arthur Pinero and Henry Arthur Jones and superior to the best work of Sydney Grundy. Somerset Maugham, who began his career with a sombre play, *The Man of Honour*, changed his *métier* completely and very soon reached a high and profitable position as a writer of light comedy. He is the most skilful writer of the comedy of manners now working for the English theatre and his plays, *Home and Beauty* (re-named *Too Many Husbands* in America) and *The Circle*, put him in direct line of succession to Congreve. J. E. Harold Terry may be said to have been produced by the war. His plays are notable chiefly for their tropical quality, but they are well-done and are not without universal appeal. His first play, written in collaboration with Lechmere Worrall, was entitled *The Man Who Stayed At Home*. It was produced at the Royalty theatre Dec. 10 1914, when the condition of theatrical enterprise was still sore from the effects of the war's beginning, and it was an immediate success. Terry wrote a second play with a war motive, entitled *General Post*, produced at the Haymarket theatre March 14 1917. This play, slightly similar in theme to Meredith's *Evan Harrington*, was also a great popular success. In 1921 he produced a play entitled *The Fulfilling of the Law*, in which special appeal was less direct.

The situation at the outbreak of the war, therefore, was one of great hope and of considerable achievement. A finer type of play was being written in every department of the theatre. The influence of Shaw, strong among the intellectuals and distinctly felt among the commercial dramatists, was even discoverable in the work of the melodramatists, whose plays began to show signs of sociological interest. A more enterprising form of management was obtaining a hold on some theatres, and even in minor matters, such as stage *décor*, a newer and better spirit was informing productions. The vicious principle of subordinating the play to the actor-manager was fading away. Demand was made for a high level of acting throughout the cast, for better team-work, and actors were busy forcing the Actors' Association into a trade union for the purpose of improving their conditions of employment.

Stage Production.—Simultaneously with this improvement in the kind of play and of the quality of the acting there was also an improvement in the mechanics of the theatre. The whole business of stage decoration, both from the point of view of scenery and of lighting, was undergoing a profound change, due chiefly to the work of E. Gordon Craig, the son of Ellen Terry. The elaborate "sets" used by Sir Henry Irving and, later, by Sir Herbert Tree involved a serious waste of time in changing scenes, to such an extent that Shakespeare's plays were mercilessly "cut" and even re-shaped to make them fit the requirements of the stage-carpenter. The reaction from this sort of thing brought a demand for more manageable scenery. Craig had been experimenting with stage settings for many years and had produced "sets," particularly suited to poetical plays, which were undeniably beautiful. They had the supreme merit of enabling a manager to perform a Shakespearean play as it was written by its author and with no other "cuts" than were made necessary by a different code of manners or by the obscurity caused through the lapse of time. Craig founded a school of decorative artists in Florence and printed his theories in various books of which the principal one is *The Art of the Theatre*. His influence on stage *décor* has been immense. The famous Moscow Art theatre admittedly derives from him, and it is indisputable that Herr Reinhardt, the great German producer, owes much to him (see *Reinhardt und seine Bühne*, by Ernst Stern and Heinz Herald, Berlin, Eysler & Co.). In England Craig's influence is wide and admitted. Decorative artists, such as Norman Wilkinson, Claude Lovat Fraser, (d. June 18 1921), Hugo Rumbold, Charles Ricketts and Albert Rutherston, derive from him, as do producers such as Granville-Barker, Nigel Playfair, Bernard Fagan and Basil Dean. In America Lee Simonson, Robert Edmond Jones and Rollo Peters acknowledge Craig's authority.

Simplicity was the key-note of Craig's demand. He achieved impressions of height and depth by the use of long curtains and the manipulation of light, and it became plain that in future production would be less a matter of complex machinery and more a matter of manipulated light. Drury Lane theatre, on its mechanical side, has the appearance of a large engineering works, and its very complicated machinery requires the attention of a large staff of skilled mechanics. There is not likely to be any growth in the extent of engineering-production, although engineering will not entirely disappear from the theatre. We are likely to achieve a revolving stage in every theatre, with deep cellars into which whole "sets" can, if necessary, be dropped. Scenes will often be a matter, not of substantial things, but of actual light. It will then be possible to produce a Shakespeare play in a great variety of scenes, without elaborate "cuts," in a very short time. In America, where electricity is much cheaper than it is in England, experiments with light have been made for many years, with the result that production is in a more advanced state than it is in England. Some of the more modern English producers, such as Basil Dean, had to import electrical apparatus from America.

The movement for greater simplicity in stage *décor* received some impetus in England from the employment of Craig by Sir Herbert Tree to make the scenery for *Macbeth*. A quarrel, followed by litigation, prevented the experiment from being completely made, but Tree used enough of Craig's designs to show their austere beauty and value. It was not, however, until Granville-Barker began his remarkable season at the Savoy theatre with the production of *The Winter's Tale* in Sept. 1912, followed by *Twelfth Night* in Nov. of that year and *A Midsummer Night's Dream* in 1914, that the new methods of production received extensive consideration. Barker, who had been associated with J. E. Vedrenne at the Court theatre where Shaw's plays first received popular support and Galsworthy became known to the public as a dramatist, and was later associated with Frohman and Dion Boucicault in the Duke of York's season already described, entered into management with Lillah McCarthy, both at the Savoy and at the Kingsway, where he conducted seasons of remarkable value and courage, dramatically and decoratively. A number of plays, old and modern, English and foreign, were produced by him in a highly brilliant and, in several instances, exceedingly beautiful manner. Some of his innovations were not successful in obtaining the degree of beauty at which he aimed—the use of golden-faced fairies in *A Midsummer Night's Dream*, for example, introduced a metallic and heavy element, unattractive in itself, into a world where insubstantiality was the primary requirement, and took, moreover, the English quality out of the play—but it is impossible to deny high tribute to him for the quality of his work and the great distinction he achieved for the theatre. The plays produced at the Savoy, in addition to the three Shakespearean plays already named, were *The Tragedy of Nan* by John Masefield; *The Witch*, translated from the Norwegian of H. Wiers-Jennsen by Masefield; *The Silver Box* by Galsworthy; *The Wild Duck* by Ibsen; *The Doctor's Dilemma* by Bernard Shaw; a translation of Molière's *Le Mariage Forcé* and Alfred Sutro's translation of Maeterlinck's *The Death of Tintagiles*. Prior to the season at the Savoy, Barker had conducted a short season at the St. James's where he produced *Androcles and the Lion* by Shaw, followed by a *Harlequinade* composed by Dion Clayton Calthrop and himself. Simultaneously with his season at the Savoy he conducted a season of modern English plays at the Kingsway, producing *The Eldest Son* by Galsworthy, followed by revivals of his own play, *The Voysey Inheritance*, Shaw's very popular piece, *Fanny's First Play*, and Arnold Bennett's *The Great Adventure* in which Henry Ainley and Wish Wynne especially distinguished themselves. Bennett's play was a great popular success, almost as popular as *Milestones* which he wrote in collaboration with Edward Knoblock. Mr. Shaw seemed to be on the crest of a high wave of popularity, for not only had *Fanny's First Play* been performed for more than 600 times, but his five-act comedy *Pygmalion*, with Sir Herbert Tree and Mrs. Patrick Campbell in the principal parts, which was produced at His Majesty's April 11 1914, ran for 118 nights, a long run for any play in so large a theatre. Two plays by Galsworthy, *The Mob* and *The Fugitive*, were not popular successes and were hardly on the general high level of his work. Sir James Barrie's activities during the five years preceding the war, apart from the production of *The Adored One*, were confined to one-act plays, of which *The Twelve-Pound Look* is likely to be a classic example of the short play at its best. Others of these plays, notably *The Will* and *Rosalind* were very near the level of *The Twelve-Pound Look*.

Effects of the World War.—The situation, then, at the outbreak of the World War was one of extraordinary interest in the English theatre. The theatrical season 1913–4 had closed with considerable brilliance. Plays of merit had been extensively performed in London and in the provinces, and the repertory theatres were in a fairly healthy condition. A rich level of acting had been discovered. Production was on a genuinely artistic scale. The season of 1914–5 seemed likely to open still more brilliantly than the season just concluded. There was even talk of a national theatre at which the plays of Shakespeare would be permanently performed. On Aug. 4 1914 Great Britain declared war against Germany and immediately the great revival of the English theatre languished and seemed at first in danger of total collapse. Many of the repertory theatres soon ceased to exist. In 1921 the Gaiety theatre, Manchester, passed from the hands of Miss Horniman to a kinema syndicate. A gallant effort to maintain a decent standard of plays was made by some managers; Sir Herbert Tree revived L. N. Parker's pageant piece, *Drake*, and Mr. (now Sir) Frank R. Benson revived *Henry the Fifth* in the laudable desire to satisfy patriotic cravings with something of value. Granville-Barker produced a number of scenes from Thomas Hardy's *The Dynasts* at the Kingsway. But these attempts to keep the theatre on a high level were not successful, and very soon began the process of degeneration which was maintained for the whole period of the war. Some of the managers gave up their efforts to save the tradition they had established: Sir Herbert Tree and Cyril Maude went to America. Others such as Gerald du Maurier remained in London and, with great courage, made a fight for decent drama. Among the plays produced by Gerald du Maurier during the war was a strange piece, very popular, entitled *Dear Brutus* by Sir James Barrie, and a revival of the same author's *A Kiss for Cinderella*. Du Maurier, more than anyone else during the war, kept faith with fine things finely done.

For the first two years of the war, a form of entertainment inaptly described as "revue" was very popular. The chief features of these entertainments were light and colour and jingling music and pretty girls and broadly comic effects. They were a medley of music-hall and musical comedy and pantomime performances, reduced to a low level. Some of the individual performers in these entertainments, notably Ethel Levey and Violet Loraine, Harry Tate and George Robey, were of indisputable talent, but generally speaking, personalities were submerged in spectacles. Mr. C. B. Cochran, more wise than some of his competitors, exploited personalities in his "revues," which were handsomely and even wittily done, and in Mlle. Delysia and Nelson Keys he discovered two artists of very great merit. Farces of a bold and even indecent character were next to the revues in popular esteem. Oddly enough, certain plays commonly called "highbrow" became popular during the war for reasons which were not concerned with literature. Brieux' banned play, *Les Avariés*, known in England as *Damaged Goods*, was licensed by the censor for public performance on the representations mainly of medical men and sociologists, and it was widely patronized in London and the provinces. The artistic value of *Damaged Goods* is slight, but its sociological value is indisputably great, and it brought a degree of publicity to the discussion of evils which would have been impossible in England prior to 1914. The success of this play led to the public performance of Brieux' play, *The Three Daughters of M. Dupont*, and of Ibsen's *Ghosts*, from which also the ban was removed by the censor. The latter play, however, is not, like *Damaged Goods*, a propaganda play and it received little support in spite of its being labelled "A Play for Adults only." The rule of the censor was considerably relaxed during the war and his ban was removed from Shaw's one-act play, *The Shewing-up of Blanco Posnet*, but attempts to obtain a licence for *Mrs. Warren's Profession* were unsuccessful. Since the conclusion of the war the censor's rule has been tightened again, but, as a result of the changes made on the recommendations of the Joint Select Committee on Stage Plays (censorship) 1909, the rule bears rather less arbitrarily on meritable work than it formerly did.

The end of the war found the stage in a chaotic condition. The demand for entertainment during the hostilities had been so great

that theatre rents rose rapidly to absurd figures: a common rent at any time between 1915 and 1921 for a theatre in the centre of London was £400 to £500 per week. All other expenses, owing to the high cost of living, increased proportionately, but the price of admission, apart from the entertainment tax imposed during the war (which did not benefit, but rather harmed, the theatre manager) remained at the pre-war figure. Slight increases, after the Armistice, were made in one or two cases, but in 1921 the economic situation in the theatre was that the revenue remained at the pre-war figure while the expenditure was on the post-war scale. Such a situation as that is only endurable when the theatre is filled with an audience, each member of which has paid for his seat. In pre-war times a play could be profitably performed before an audience occupying three-fourths of the seats. A manager could even make ends meet although half his seats were unsold. He could afford to lose money on a production for four or five weeks if he had a reasonable hope that thereafter profitable audiences would assemble for the performances. In 1921 a manager could not hope to make money out of a production unless his theatre was fully occupied at each performance. If a play failed to draw enough people to fill all or nearly all his seats, that play could not be continued in his programme. The financial burden was too heavy to be borne; and for this reason many meritable pieces which might have been "nursed" into popularity were withdrawn almost immediately after production because they had not at once taken hold of popular fancy. The plays which suffer from this economic situation are undoubtedly the better kind of plays. Those which profit from it are the plays without merit other than that of a spectacular character. The best illustration of the effect of this situation on the drama is to be found in the remarkable popularity of *Chu Chin Chow*, an eastern spectacle written by Oscar Asche. This banal piece, a variant of the theme of *Ali Baba and the Forty Thieves*, was produced at His Majesty's theatre—a theatre with an honourable tradition—on Aug. 31 1916. It ran for nearly five years, creating a record of over 2,200 consecutive representations. Every device of colour and light and costume was used in this production. The appeal made was almost exclusively to the eye, very little to the ear and not at all to the mind. *Chu Chin Chow* broke all records for consecutive performances at one theatre and earned large fortunes for those who were concerned in its production.

In spite, however, of the difficult economic situation, of the change in tradition and government of the theatre, there was a remarkable recovery of quality on the English stage after the signing of the Armistice, and plays of quality began to appear, not timidly, but almost arrogantly. A play by Galsworthy, *The Skin Game*, dealing with the conflict between aristocracy and plutocracy (in which both sides are badly besmirched) and susceptible of allegorical application to the war and the treaty of peace, was performed with great success at the St. Martin's; and a political comedy, entitled *The Grain of Mustard Seed*, by H. M. Harwood, produced at the Ambassadors' had a singularly successful "run," singular because of the fact that political plays are rarely acceptable to English audiences. Sir James Barrie's *Mary Rose* was performed at the Haymarket with enormous success. In this play he treated the problem of life after death in a fashion which divided playgoers sharply into complete devotees or complete sceptics. *The Skin Game* was successfully produced in America, but *Mary Rose* hardly won the favour in New York that it had won in London. The most interesting post-war success was the popularity with which Gay's *The Beggar's Opera* was revived at the Lyric opera house, Hammersmith. It was not, however, a success in America. Rostand's *Cyrano de Bergerac* was revived with notable success by Robert Loraine, and Bernard Shaw's *Arms and the Man*, also revived by Loraine, had astonishing success with ex-soldiers on account of its anti-romantic treatment of war. Shakespeare's plays are extensively produced. A working-class theatre in the Waterloo Road, London (popularly known as "the Old Vic."), had maintained the standard of good drama throughout the war, and this theatre, handicapped by lack of funds and rather amateurish acting, steadily built up an audience for good plays. After the Armistice its work was amply rewarded. The "Old Vic." became the one theatre in London where playgoers could depend on seeing great drama, and as the quality of the acting was much improved, they could also depend on seeing competent performances. Bernard Fagan in 1920 reconstructed the Court theatre and announced that it would henceforth be a Shakespearean theatre, where four of Shakespeare's plays would be produced annually. But the economic situation made gallant enterprises difficult, and it remains to be seen how far good intentions will survive high prices. The era is one of transition, and the period of transition nearly always causes more pessimism than good hope.

United States

In America, the theatre, after the end of the war, was in a healthier state than in England. This is more true of New York perhaps, than of the rest of the country. Playgoers in that city seem more willing to patronize good things and to support new enterprises than playgoers anywhere else. A remarkable organization entitled The Theatre Guild of New York has, in three years, raised itself from an obscure, impoverished and unknown position into that of the only first-class theatrical enterprise in the world which is a great financial success. The Theatre Guild grew out of the activities of a small group of enthusiasts who were known as the Provincetown Players and the Washington Square Players. These players gave performances, usually of one-act plays, in small theatres near Washington Square. They were akin to the movement, very widespread in America, known as the Little Theatre or Community Theatre movement—societies of amateurs producing plays primarily for their own entertainment rather than for profit. The Theatre Guild, when established, secured a long lease on an old theatre, the Garrick, in West 35th St., and began operations with the production of *Bonds of Interest*, translated from the Spanish of Jacinto Benavente. This play (*Los Intereses Creados*) has been done in England both under the American title and under that of *The Bias of the World*. It was not a financial success, and the capital of the Guild, about $500, was almost exhausted when the directors decided to produce *John Ferguson*, a four-act tragic Irish play by St. John Ervine. This play was not expected to be financially successful, but it falsified anticipation. It was performed in New York for nine months, and enabled the Guild to establish itself more securely. Subsequent productions, including Masefield's *The Faithful*, were not quite so profitable, but the season ended with greater hope than it had begun. In the following season Tolstoy's *The Power of Darkness*, St. John Ervine's *Jane Clegg*, Strindberg's *The Dance of Death*, and other plays were performed, of which *Jane Clegg*, which ran for five months, was the most financially successful. The third season included the first production in English of Bernard Shaw's *Heartbreak House*, as well as of A. A. Milne's *Mr. Pim Passes By*. Both these plays made much profit for the Guild, the first-named running for 150 performances. The success of the Theatre Guild and of *John Ferguson* caused an immediate effect on theatrical entertainments in New York, and one interesting result of it was that a young American dramatist of Irish descent, Eugene G. O'Neill, was given an opportunity of producing his plays at a first-class theatre. He had already become known as the author of one-act plays when his six-act tragedy, *Beyond the Horizon*, was produced at the Morosco theatre in New York. This play, most skilfully acted, had a great success, and those who are desirous of seeing a fine native drama grow up in America felt encouraged to maintain their hope when they contemplated O'Neill's work. In 1920 he produced a strange play in eight scenes, entitled *The Emperor Jones*, which is what may be called a one-part play, dealing with the journey of a negro into a West Indian forest where he lapses into primal terror. This play was produced by the Provincetown Players and the principal part was acted by a remarkable negro actor, Charles Gilpin. O'Neill is perhaps the most significant figure that the American theatre has produced since the death of William Vaughn Moody, and the quality of his work justifies hopes of raising the standard of American drama to a considerable height.

American dramatists display great technical excellence in their work, together with a tendency towards sentimentalism of a curiously crude character. There is probably more mechanical ability among American dramatists to-day than among any other dramatists in the world, but this ability is seldom related to artistic power and it is frequently used to falsify life. There are signs, however, of discontent with slick sentimentality, and young writers throughout the country are endeavouring to relate technical excellence to plays in which life is truly treated. Dramatic craftsmanship is more closely studied in America than in England, and in many of the colleges and universities students take a course in dramaturgy. The most interesting experiment of this kind is that conducted by Prof. George P. Baker, professor of dramatic literature at Harvard University, who, in what is popularly known as "the 47 workshop," instructs his pupils in the writing and production of plays from the point of view of author, producer, actor and critic. Many of his pupils have written competent one-act plays and several of them have successfully produced more ambitious pieces. One of the ablest of American dramatists and, at the same time, the least prolific, is James Forbes, the author, among other plays, of *The Chorus Lady*, *The Show Shop* and *The Famous Mrs. Fair*. Forbes produces mainly satirical comedies of stage-life, but the last-named piece deals with ordinary life and is a very able bit of work. Other

notable dramatists are Edward Sheldon whose *Romance*, with Doris Keane in the principal part, was extraordinarily successful in England; George Broadhurst—his *Bought and Paid For* was described by Arnold Bennett as one of the best commercial plays he had ever seen; David Belasco; the late Clyde Fitch; Langdon Mitchell, the author of a brilliant comedy, *The New York Idea;* Augustus Thomas, whose *The Witching Hour, The Harvest Moon, As a Man Thinks* and *The Other Girl* are plays of uncommon quality; the late Charles Klein; Eugene Walter, author of two particularly able realistic plays, *Paid in Full* and *The Easiest Way;* Channing Pollock; A. E. Thomas; Booth Tarkington who, more popularly known as a novelist, achieved remarkable success in 1920 with a light comedy called *Clarence;* Zoë Akins; and Susan Glaspell. The condition of the theatre in America at the end of the decade 1910–20 was more hopeful than that in England because of the greater general interest in meritable plays and of the noticeable desire, especially in New York, to support original enterprises.

The standard of acting in America so far as actresses are concerned, is higher than in England, but there is more all-round efficiency among English actors than there is among American actors. The latter excel in character-parts—a very admirable instance of this is the case of Frank Bacon in his own play *Lightnin'* —but are less capable in what are known as "straight" parts. With the exception of John Drew there are few American actors who can interpret characters such as were acted by Sir George Alexander. It is very difficult to discover either actors or actresses in America who can speak verse. These flaws in technique are remediable, however, and are slowly being rectified. One result of the war was to cause a distinct decline in the quality of acting among young players in England, and it is probably true to say that there was less acting ability among the younger members of the English theatrical profession at the end of 1920 than at any other period in the history of the English theatre. In America, on the contrary, there was a marked growth in technical skill among young actors and actresses.

Germany

In 1910, the condition of the drama in Germany was very curious —declining in Berlin, but flourishing in the provinces. Metropolitan taste was fickle and vulgar; provincial taste was steadfast and of high quality. The result of this odd reversal of customary positions was that the German provinces absorbed almost the whole of the interest of dramatic students. More experiments were made outside Berlin than were made inside it, not only in the quality of the plays performed, but also in the methods of production and in the interior economy of the theatre. Volksbühnen (people's theatres) were organized in many places, at which performances of classical and modern pieces were given at very moderate prices. The two Freien Volksbühnen of Berlin, which were typical in most respects of all the other people's theatres, had between them a membership of 60,000 persons, of whom a considerable number were working-men. These Freien Volksbühnen contracted with various theatre-managers for the performance of specified plays for their members, and the larger of the two, Die Neue Freie Volksbühne, was spending £25,000 per annum in 1910 on plays produced at 11 different theatres. This society even started a building fund, which in that year had reached £5,000, for the purpose of establishing a theatre of its own, to hold 2,000 persons. The members of this society paid one shilling for each performance witnessed, and seats were allotted by ballot. A similar society, with a membership of 9,000 persons, existed in Vienna, under the direction of Stefan Grossmann, a dramatist. The Cologne Stadt-theater organized performances on lines similar to those of the Volksbühnen, on Sunday afternoons before audiences drawn from workmen's societies which were allowed to nominate the play to be produced. In 1909, the trade unions of Cologne chose Galsworthy's *Strife* for performance, and this play was received with enormous enthusiasm. A Deutsches Volkstheater was in process of erection in 1909. Each subscriber to this society was to be admitted to one performance per week in a season of 40 weeks and to receive a theatrical paper, delivered free of charge, together with free admission to a number of lectures, for an annual subscription of 20 shillings! The number of Stadtbund theatres was increasing remarkably, and certain towns either subsidized or completely owned the local theatre. The following is a record of sums paid by German cities and towns for their own theatres:—Cologne, £25,000; Frankfort, £13,000; Barmen, £6,000; Dortmund, £6,000; Essen, £4,000; Elberfeld, £4,000; Aachen, £3,500; Breslau, £3,000; Düsseldorf, £2,500; Magdeburg, £2,500; Kattowitz, £1,000; Thorn, £1,000.

The two great German dramatists, Gerhart Hauptmann and Hermann Sudermann, had reached the apex of their powers in 1910 and were beginning to yield place to new men, of whom the chief were Frank Wedekind, Arthur Schnitzler (an Austrian and, like Somerset Maugham and H. M. Harwood in England, a doctor of medicine) and Hermann Bahr. Problem and "tendency" plays were prolifically produced, and the drama of intellectual concepts rather than the drama of human emotions seemed to predominate. Just before the outbreak of the World War, a number of allegorical plays were being performed, such as *Haus am Meer* by Stefan Zweig and *Mutter* and *Gelebtes Leben* by W. von Molo. But, apart from the extraordinarily experimental character of much of German drama and stage production during this time, the general range of theatrical entertainments was very catholic, extending from harshly realistic plays of the soil, such as Sudermann's *Strandkinder*, to purely poetic plays, such as *Medusa*, by a young dramatist of promise, Hans Kyser. In addition to the very diverse quality of native drama, the German theatre produced many foreign plays, equally diverse in character, ranging from Shaw's plays to plays by Jerome K. Jerome. Ibsen, Björnson and Strindberg (who died in 1912) had much popularity in Germany, and so had many French dramatists, but none of them had greater popularity than Shaw, Oscar Wilde and Galsworthy. Other English writers, Maugham, Sir James Barrie, Sutro, Arnold Bennett and Edward Knoblock, Monckton Hoffe, H. H. Davies, Sir Arthur Pinero, W. J. Locke and L. N. Parker, were freely and extensively admitted to the German theatre. Shakespeare, of course, had long been a popular author in Germany and this popularity did not decline during the war.

Hauptmann, who received the Nobel prize on his fiftieth birthday in 1912, was fairly prolific during the five years preceding the war. *Griselda*, founded on Boccaccio's legend, was produced in 1909, and was followed in 1911 by *Die Ratten* (*The Rats*). *Gabriel Schillings Flucht* (*The Escape of Gabriel Schilling*) was produced in 1912. and in 1913 came the famous Festival Play commissioned by the city of Breslau to celebrate the war against Napoleon for freedom. This play was produced by Reinhardt in the new rotunda of the Breslau Centenary Exhibition, and its democratic sentiments were so displeasing to the Junkers that it provoked a great uproar. The then Crown Prince threatened to cancel his patronage of the exhibition unless the play were withdrawn—which was done. Another play, entitled *Der Bogenspanner Odysseus* (*Odysseus the Archer*), was written in 1913.

Hermann Sudermann was less prolific than Hauptmann. His *Strandkinder*, a play about people living on the shores of the Baltic Sea, was produced in 1909. This play had considerable affinity with the work of a dramatist who died in 1909, Ernst von Wildenbruch, two of whose plays, *Lieder des Euripides* and *Der Deutsche Konig*, were performed. after his death, in that year. *Strandkinder* was followed by an historical piece, entitled *Der Blinde von Syracus* in 1911 and *Der Gute Ruf* in 1913.

The ascending dramatists, Bahr, Wedekind and Schnitzler, produced many plays in the first half of the decade, as did another well-known, but peculiar and unsuccessful dramatist, Herbert Eulenberg. Bahr, whose gift is for human comedy, is known abroad by *Das Konzert* (*The Concert*) which was not notably successful in London, but was very popular in America as well as in Germany. Another play, *Kinder*, was produced simultaneously in 20 different German theatres in 1910. It was followed by *Das Prinzip* and *Das Tänzchen* in 1912 and by *Phantom* in 1913. Frank Wedekind, a dramatist of queer, undisciplined genius, was by far the most prolific of all the dramatists in Germany during the period under review and probably of all the dramatists in Europe. He produced nine plays in five years, four of which, indeed, were in one act. The plays were *Die Junge Welt*, *Die Zensur* (one act), *Der Liebestrank*, *Die Büchse der Pandora*, and three one-act plays, *In Allen Satteln Gerecht*, *Mit Allen Hunden Gehetzt* and *In Allen Wassern Gewaschen*, which were combined in 1911 under the general title of *Schloss Wetterstein* and issued with the statement that they contained his views "on the inner necessity on which Marriage and the Family rest." These plays were followed by *Der Stein der Weisen* and *Franziska*, the latter, prohibited by the censor in Vienna, being produced in Munich. Arthur Schnitzler, a Viennese, known in England through the *Anatol* plays, translated by Granville-Barker, and *Der grüne Kakadu* (*The Green Cockatoo*), had four plays performed in the first five years of the decade, *Komtesse Mizzi*, *Der junge Medardus* (which took five hours to perform), *Das Weite Land* and *Professor Bernhardi*, the latter of which was forbidden in Vienna. Herbert Eulenberg was responsible for six plays, *Der natürliche Vater*, *Anna Wolewska*, *Samson* (his most popular piece), *Alles um Geld*, *Alles um Liebe*, *Belinde* (which won the Volksschiller prize), *Zeitwinde* and a one-act play, *Paul und Paula*. Hans Kyser, in addition to the play already named, produced *Titus und die Jüdin* and *Erziehung zur Liebe*.

The list of meritable German dramatists is a very long one. It includes men such as Paul Ernst, Hans Franck, Otto Harnack, Carl Schönherr, whose Volksstück ("people's play") *Glaube und Heimat* was performed in more than a thousand theatres in six months, Edward Stucken, Max Halbe, Ludwig Fulda, Ludwig Thoma, Franz Dulberg, Leo Birinski, Reinhard Sorge and Arno Holz. The records of the German theatre during the war indicate that a better standard of play was maintained there than elsewhere. Since the signing of the Armistice a new group of dramatists has arisen, of whom Georg Kaiser is known in England, because of the performance of his play *Von Morgens bis Mitternacht* (*From Morn to Midnight*) before the Stage Society in 1919. He experiments with new dramatic forms, but his work hardly merits the extravagant claims made for it. In addition to the play named, he has written others, of which the most meritable are *Die Bürger von Calais* (*Burghers of Calais*) and *Die Koralle* (*The Coral*). A violence of sex-interest has been manifested in much of the post-war German drama, and this was most plainly to be detected in Schnitzler's *Reigen* (*The Chain*).

Perhaps the most interesting figure in the German theatre since the signing of the Armistice has been Max Reinhardt, who derives,

with more practicability, from Gordon Craig. Prior to the war he was known in England as the producer of *The Miracle, Oedipus Rex* (with Sir John Martin Harvey and Lillah McCarthy in the principal parts) and *Sumurun*. His taste is for spectacular pieces of an ambitious nature. He was in 1921 in charge of Das Grosse Schauspielhaus (the Great Arena theatre), which was opened in 1919 and has seating capacity for 3,000 persons.

France

In 1910, the theatre in France gave less occasion for satisfaction than the theatre either in England or in Germany. The traditions of decent drama were, of course, maintained at the Comédie Française, the Antoine and the Odéon, but, broadly speaking, plays of quality were few in number and "revues" of a very vulgar character were growing in popularity. That bad state of affairs could not last, and after 1910 until the outbreak of the World War, when the French theatre for obvious reasons completely collapsed, there was a revival of quality in French drama. The French theatre, too, which had not previously offered much hospitality to foreign plays, began to open its doors, not widely, indeed, but slightly to plays written by foreigners. Shakespeare suddenly came into fashion. *Hamlet* was produced at the Comédie Française, *King Lear* at the Antoine, *Julius Caesar* at the Orange Fêtes, and *Romeo and Juliet* at the Odéon. Camille de Saint-Croix organized single performances of many Shakespearean plays which were highly praised. One of Shaw's plays was performed in Paris, but without much favour. English musical comedy, produced on a more extravagant scale than is customary in France, became popular, and George Grossmith set the Parisians to singing "Ip-i-addy-i-ay-i-ay."

The most interesting play produced in Paris during the first five years of the decade was undoubtedly Edmond Rostand's *Chantecler*, which had been anticipated for seven years before it was performed for the first time at the Porte-Saint-Martin in 1910. It had not the great success of *Cyrano de Bergerac*, but it caused much discussion. Lucien Guitry played the part originally intended for the late Constant Coquelin, which part was played in New York by Maude Adams. Rostand, who was born in 1868, died in 1918. Another death of great importance to the French theatre was that of Jules Claretie, who, after controlling the Comédie Française for 28 years, died in 1913. Claretie conducted the difficult affairs of the national theatre with very great skill and diplomacy, and showed clearly that while a national theatre is not a forcing-house for genius, it is certainly a place in which the level of honourable drama is highly maintained. He was succeeded by Albert Carré, who remained in charge of the theatre until he was called up for military service during the war, when he was succeeded by Emile Fabre, a dramatist. Paul Hervieu, the dramatist, died Oct. 25 1915, and Mme. Réjane, the famous actress, June 14 1920.

Much useful, if not particularly significant, work was done by French dramatists from 1910 to 1915, but none of the disintegrating and insurgent influences detectable both in the English and the German theatres appeared to affect the French theatre. Stage *décor*, for example, is singularly poor in France, where, on the other hand, the standard of acting is very high. In addition to Rostand's play, notable pieces were produced by Henry Bataille (*Le Songe d'un Soir d'Amour* and *La Vierge Folle*—the first of which, done at the Comédie Française, was hardly so successful as the second, done at the Gymnase), by Pierre Wolff (*Ruisseau* and *Marionettes*), Henri Bernstein (*L'Assaut* and *Le Secret*), George Duhamel (*La Lumière*), Brieux (*La Femme Seule*, done in England under the title of *Woman on Her Own*), Maurice Donnay (*Les Eclaireuses*), Sacha Guitry (*Le Beau Mariage* and *La Prise de Berg-op-Zoom*), De Flers and de Caillavet (*Habit Vert*) and Tristran Bernard (*Jeanne Dore*—with Sarah Bernhardt in the cast).

After the outbreak of war, the French theatre for a considerable period practically ceased to exist. Conscription and war regulations, together with enemy air-raids and proximity to the front, made theatrical enterprise in Paris either impossible or exceedingly difficult. Some companies of French players came to London. There were only two new plays produced in Paris in 1915—*Les Deux Vestals*, a farce of an old-fashioned broad character, done at the Gymnase, and a translation, made by W. B. Perier, of the English play, *The Man Who Stayed at Home* by J. E. Harold Terry and Lechmere Worrall, which was done at the Théatre des Boufles Parisiens under the title of *Kit*, with Max Dearly in the cast. Several war plays, not particularly meritable, were done in Paris towards the end of the war or immediately after the signing of the Armistice, and Sacha Guitry's play *Deburau* was also produced. A translation of this play, done into rhymed couplets, has been made by H. Granville-Barker and was produced in New York in 1921 with great success. Edmond See's *Saison d'Amour* was produced in 1919, and Sacha Guitry, rapidly acquiring a high place in France as a dramatist and an actor, was responsible for *Pasteur*, a farce entitled *Le Mari, La Femme et L'Amant* (a title which sufficiently indicates the character of the piece), and a comedy called *Mon Père avait Raison*. The Guitrys, father, son and daughter-in-law, gave a season of their plays in London in 1920 which was exceedingly successful. (St. J. E.)

DRESDEN, Saxony (*see* 8.574).—The pop. of Dresden, according to the census of 1919, was 529,326; in 1910, without some suburbs since incorporated, it was 548,308. Dresden was perhaps harder hit by the World War than most other towns in Germany. The whole structure of its economic life had been dependent upon visitors, especially foreigners, and the outbreak of the war brought this to a sudden stop. In addition, the shortage of food, serious everywhere, was more especially felt in Saxony and her capital, which were dependent mainly upon industry. Lastly, the revolution swept away the life of the Court, which meant a great deal for Dresden. With the revolution came the development of extreme political tendencies among the working classes of Dresden, which led to constant disturbances, strikes, etc., although the violent and sanguinary encounters associated with the insurrectionary movement in western Saxony, were less widespread in Dresden. But the assassination of Neuring, the majority Socialist Minister of War, on April 12 1919, and the sanguinary street fighting of Jan. 9 and 10 of the same year, are sufficient proof that the capital of Saxony was not immune from scenes of violence. After 1914 the expansion of the city came to a complete standstill, and in 1921 Dresden, like other towns, was suffering severely from lack of housing accommodation. After the revolution there was a majority of extremists in the Municipal Council, and the financial position of the city had become very precarious.

The collections and museums will doubtless maintain the reputation of Dresden as a centre of art. The Royal Opera, which enjoyed a world-wide reputation before the World War, has not been able as a State Opera to maintain its high artistic level. Industry came to a complete standstill during the war—the manufacture of cigarettes, for instance, which was very flourishing, had to be cut down owing to lack of raw material—but by 1921, some recovery had taken place and Dresden showed signs of returning prosperity as a resort for visitors. (C. K.*)

DRINKWATER, JOHN (1882–), English poet, playwright and critic, was born at Leytonstone, Essex, June 1 1882 and educated at the Oxford high school. After twelve years' work as an insurance clerk he began to devote himself to theatrical enterprise, and became manager and producer to the Pilgrim Players, who developed into the Birmingham Repertory Theatre Company. His first volume of poems appeared in 1908 and his first play *Cophetua* (in verse) in 1911. He subsequently published several volumes of verse, critical studies on *William Morris* (1912), *Swinburne* (1913) and others, and several plays, of which *Abraham Lincoln* (1918) was produced with great success both in London and in America.

DRIVER, SAMUEL ROLLES (1846–1914), English divine and Hebrew scholar (*see* 8.585), died at Oxford Feb. 26 1914. His later works include *Four Papers on the Higher Criticism* (with F. Kirkpatrick, 1912).

DROYSEN, GUSTAV (1838–1908), German historian (*see* 8.596), died at Halle in 1908.

DUBAIL, AUGUSTIN YVON EDMOND (1851–), French general, was born at Belfort April 1851. At the age of 17 he entered the military academy at St. Cyr, and on July 15 1870 was appointed a sub-lieutenant of infantry, having passed seventh out of 310 candidates. He took part in the Franco-German War and was captured at Metz in Oct. 1870. Released in April 1871 he rejoined his regiment, and served with the army of Versailles in the operations against the Commune. He was appointed captain and transferred to the 81st Inf. Regt. in Nov. 1878. From Oct. 1880 to Feb. 1883, and again from Nov. 1883 to Jan. 1886, he had an appointment as professor at the École Spéciale Militaire St. Cyr. In June 1886 he was made a chevalier of the Legion of Honour. In Nov., while serving in Algeria, he was promoted lieutenant-colonel; and in Oct. 1901, while still in Algeria, was made a colonel and given command of the 1st Regt. of Zouaves. On returning to France he took over the Alpine Brigade at Grenoble. In 1906 he became commandant of St. Cyr—an appointment which he held for three years. He was made a divisional commander on Dec. 25 1908, being appointed to the 14th Div. at Belfort. He later commanded the IX. Army Corps. In 1911 he was made chief of the general staff and a member of the Superior War Council. On the

outbreak of the World War Gen. Dubail took over the I. Army, which (with the II. Army under Gen. de Castelnau on the left) was responsible for the offensive into Lorraine, and later for the defence of the eastern fortress line against the armies of Prince Rupprecht of Bavaria. The stubborn resistance of Dubail and Castelnau not only nullified the threat of invasion but insured a pivot for future French manœuvres; it prepared the way indeed for the Marne victory. Gen. Dubail was given the Grand Cross of the Legion of Honour (Sept. 18 1914). On the withdrawal of the II. Army to the Somme, Dubail took charge of the whole line between Verdun and the Vosges, and when in Jan. 1915 the armies along the front were grouped under three headquarters of groups of armies, Dubail was placed in charge of that of the east, comprising the III. of Verdun, his old I., and the Vosges force. In Oct. of the same year he was awarded the médaille militaire. On April 6 1916 he was made military governor of Paris. He was placed in the " Second Section "—on reaching the age limit—in April 1916, but retained his appointment as military governor of Paris. After his final retirement he was appointed Grand Chancellor of the Legion of Honour.

DUCLAUX, AGNES MARY F. (1856-   ), Anglo-French poet and critic (*see* 8.632), published after 1910 a volume of essays, *The French Ideal* (1911); a study of *Madame de Sévigné* (1914); *A Short History of France* (1918); *Twentieth Century French Writers* (1920) and a life of *Victor Hugo* (1921).

DU CROS, WILLIAM HARVEY (1846-1918), British manufacturer, of Huguenot descent, was born in co. Kildare, Ireland, June 10 1846. He was educated at the King's hospital, Dublin, and became founder of the pneumatic tire industry and a pioneer in automobile construction. From 1906-8 he represented Hastings in the House of Commons. He died at Dalkey, co. Dublin, Dec. 21 1918.

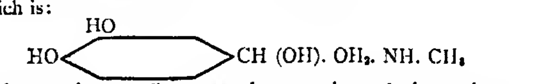
DUCTLESS GLANDS (*see* 8.633).—Much new work on the physiology, pathology and medicine of the ductless glands has been done since 1910.

There are two ways in which the *consensus partium* in the animal economy is brought about. The best known of these is that which occurs through the nervous system. But it has been recognized during recent years that other agents take part in this process of coördination. These are called the *ductless glands* through their products the *internal secretions*, which have also been called *hormones*. The latter have, however, been renamed *autocoid* substances by Schafer, and these again divided into two groups: those which excite metabolic processes and those which depress them. The former autocoids are called by him *hormones*, the latter *chalones*.

In the glands of internal secretion, or as they are sometimes called the *endocrine* organs, the material secreted is passed away not through a duct but by means of the veins leaving the organ. This material when it reaches the general blood stream acts in the manner of a chemical messenger, or of a drug, producing effects upon various organs and tissues of the body. The ductless glands which we shall have to consider are (1) *the adrenal gland;* (2) *the thyroid gland;* (3) *the parathyroid glandules;* (4) *the pituitary body;* (5) *the pineal gland*. It is probable that the thymus is not an organ of internal secretion. In addition to these certain other glands furnished with a duct and providing an ordinary or external secretion are supposed to supply the body with internal secretions also. This applies to the pancreas. Further, the *gonads* (reproductive organs) have an endocrine function.

The Adrenal Gland.—For many years it has been customary to refer to the *cortex* and the *medulla* of the adrenal body as the suprarenal capsule. But comparative anatomical studies have shown us that this is an inaccurate view of the problem. It is only in mammals that the terms cortex and medulla as applied to the two parts of the organ are strictly appropriate. In elasmobranch fishes we have to deal with a series of paired *chromaphil* bodies in connexion with the sympathetic ganglia, and with an interrenal body placed in the middle line between the two halves of the kidney. The first of these is the homologue of the mammalian medulla while the interrenal body corresponds to the mammalian cortex. Even in mammals a trace of the original arrangement still persists, *e.g.* the sympathetic ganglia contain groups of chromaphil cells and there are other outlying masses of chromaphil tissue. The cortex also is not the sole representative in mammals of the original interrenal body. So that the problem before us is by no means to discover the function of a single organ but to ascertain the significance of the chromaphil tissues (of which the adrenal medulla is only a part) and of the cortical tissues (of which the adrenal cortex is only a part, albeit the principal one).

The chromaphil tissues everywhere contain adrenin, the formula for which is:



This substance is generally supposed to constitute the internal secretion of these tissues. When injected into the circulation of a living animal it produces effects similar to those brought about by stimulation of the sympathetic nervous system. That is to say, its action is sympathomimetic. Other substances having a similar chemical constitution will produce similar physiological effects. The most striking of such effects are constriction of arterioles and an enormous rise of blood pressure, dilatation of the pupil and inhibition of the muscular coats of the alimentary canal. Small doses often produce results qualitatively different from medium or large doses.

The secretion of the chromaphil tissues does not appear to be essential to life. It is tolerably certain that it does not help to maintain the normal blood pressure. It is possible that it is important for the activity of muscular structures under circumstances of physiological and especially of emotional emergency.

Of the functions of the cortex we know practically nothing, and yet we are justified in regarding this portion as the adrenal body in the true sense of the word. Experimental and clinical evidence has taught us that it is the part which is essential to life. It seems probable that it has to do with the development of the organs of reproduction. Tumors of the adrenal cortex are frequently associated with sexual precocity in young children.

The only disease definitely traceable to a lesion of the adrenal body is that known since 1855 as Addison's disease. The most striking symptoms are a peculiar bronzing of the skin, extreme muscular weakness, low blood pressure, vomiting and other symptoms probably referable to the sympathetic nervous system. The pathogenesis of the skin pigmentation cannot be correlated with anything we know of the physiology of the gland. The muscular weakness is supposed to be pathognomic and attributable to the absence of circulating adrenin. The cases are always fatal, and treatment with adrenal substance seems to be of no use.

The Thyroid Gland.—The thyroid is developed as an outgrowth of the embryonic pharynx between the first and second branchial clefts. It is at first single and solid, but later becomes bilateral and divided up into closed vesicles. It is doubtful how far the lateral rudiments or post-branchial bodies take part in the formation of the mature thyroid in mammals. The vesicles hold a peculiar " colloid " material which contains iodine. The blood supply is very rich and nerves are provided from both vagus and the sympathetic.

Extirpation of the thyroid produces varying results according to the kind of animal employed and according to its age. The symptoms are not always very clearly defined, but they consist in general terms of the manifestations of sluggish metabolism. In young animals there may be almost complete cessation of growth though there is a tendency to adiposity. The symptoms differ from those of myxoedema in the human subject.

Diseases of the Thyroid.—*Myxoedema.*—This condition is found in middle-aged or elderly subjects, usually women. The skin becomes altered, hands and feet swollen, lips and tongue enlarged. The oedema does not put on pressure, and there is mental dullness. The symptoms are in fact those of pronouncedly slowed metabolism. The disease is clearly due to deficient thyroid secretion, and may be kept in abeyance or permanently cured by treatment with thyroid substance.

Cretinism.—This is usually due to atrophy of the gland at the time of birth. The growth of the skeleton is arrested and the nutrition of the muscles and skin is seriously affected, so that the children are deformed, and, as a result of lack of mental development, idiotic. Treatment with thyroid substance is often beneficial.

Simple Goitre.—The precise pathological condition varies in different cases. The commonest form is now very generally considered to be due to an infection from drinking-water. Many cases can be cured by treatment with intestinal antiseptics and sterilization of the water. Small doses of iodides have been found useful as a prophylactic when administered to children in goitrous districts.

Exophthalmic Goitre.—This disease is characterized by the three cardinal symptoms, enlargement of the thyroid, protrusion of the eye-balls and a rapid heart beat. It is usually ascribed to an over-secretion of the thyroid gland, though many authors prefer to attribute it to a disturbed function of the organ. Complete rest often suffices to cure the condition, though many surgeons recommend removal of a large part of the gland.

Kendall believes that he has isolated the active principle of the thyroid gland, and to this he gives the name of *thyroxin*. It is alleged that this substance may be used instead of thyroid substance in cases of thyroid insufficiency and that the results are as satisfactory as when the gland substance is employed.

The Parathyroids.—In the great majority of mammals there are four parathyroids, two in relation with each lobe of the thyroid. The glandules do not contain vesicles but consist of solid masses of cells. They are developed from the epithelium of the third and fourth branchial clefts. Most observers do not believe that they are functionally related to the thyroid.

Extirpation of all four parathyroids is rapidly fatal in the case of many animals. Where death does not occur it is usually assumed that accessory parathyroids are present. It is certainly true that in many of the herbivora such accessory glandules are frequently present. The symptoms which occur after extirpation are those of *tetany*—muscular spasms, rapid respiration, salivation, etc. The condition is now usually called *tetania parathyreopriva*, and Koch and Noël Paton ascribe it to intoxication by guanidin. They believe that the parathyroids control the metabolism of guanidin and in this way exercise a regulative action upon the tone of the skeletal muscles.

Idiopathic Tetany.—Since the symptoms of this disease strikingly resemble those of tetania parathyreopriva, it is now very generally believed that they are due to disease of the parathyroid. It is sometimes alleged also that paralysis agitans, chorea, epilepsy, and eclampsia are due to disturbance of the functions of these bodies.

The Pituitary Body.—The pituitary body consists of two principal portions, the *anterior or glandular*, and the *posterior or nervous*. The former is developed as an evagination from the ectoderm in the buccal region. The posterior portion is an outgrowth from the base of the brain. Covering the latter is a second glandular portion called the *pars intermedia*.

The glandular portion seems to give rise to substances which are essential for the proper development of the skeleton and other tissues of the growing animal, and Robertson states that he has succeeded in isolating from this lobe a substance called *tethelin*, which hastens growth in young animals. Pituitary feeding is stated to increase the output of eggs in laying hens.

Extirpation experiments seem to point to the anterior lobe as the part which is essential to life. But from the posterior lobe certain active extracts can be obtained. These extracts when injected into the circulation of a living animal produce a rise of blood pressure which is more prolonged than that produced by adrenin, but a second injection may produce a fall. The extract produces a sthenic effect upon uterine contractions and upon those of the intestine and bladder. It also causes dilatation of the pupil and constriction of the bronchioles. Pituitrin also causes a marked increase in the flow from the kidney and the mammary gland. A striking effect on metabolism produced by the administration of pituitary substance is a lowering in the tolerance for sugar.

Diseases of the Pituitary.—*Hyperpituitarism.*—Overgrowth of the anterior lobe usually of an adenomatous nature gives rise to increased growth of the bones of the extremities and of the face, and, if it occurs in young subjects, to gigantism, when, as in older subjects, it chiefly affects the face and the ends of the long bones, the condition is called *acromegaly*. Diminished sugar tolerance usually supervenes as the other parts of the organ become affected. There may be actual glycosuria and frequently polyuria.

Hypopituitarism.—In this condition the body does not grow, although there may be an extensive deposition of fat. There is marked failure in sexual development. Sugar tolerance is very pronounced and there is arrested mental development. In cases which do not arise until adult age has been reached obesity and increased sugar tolerance are the most striking symptoms.

A functional relationship between the pituitary and the other ductless glands (especially the thyroid) is more than probable.

The Pineal Gland—This tiny structure has usually been considered as belonging to the group of "vestigial remains," and its chief interest to morphologists centres round its homology with the median eye of reptiles. It is developed as an outgrowth from the third ventricle of the brain. But even in lower vertebrates there is some evidence that a glandular constituent has to be reckoned with. Within the last few years numerous writers have urged that in mammals, including man, the organ is of considerable importance, and that it belongs to the group of glands furnishing an internal secretion.

Extirpation experiments have been carried out in some animals, and it is stated that removal of the organ accelerates growth of the body and especially of the reproductive apparatus, or at any rate a hastening of the development of the reproductive functions.

Tumors of the pineal gland are associated with abnormal growth of the skeleton in children, and with early and precocious development of the secondary sexual characters. In order to correlate these findings with the results of extirpation experiments it is assumed that the tumour gives rise to a condition of hypopinealism. It will be remembered that the common tumours of the pituitary body are considered to be adenomata and to give rise to a hypersecretion.

Injection of extracts made from the pineal gland give rise to no special effects upon the blood pressure, respiration, secretion of glands, or other functions which can be investigated by ordinary kymographic methods. But it is alleged that administration of extracts over a long period to growing animals hastens the growth and development of the reproductive organs. If these statements are correct they only tend in the present stage to complicate the problem, for it is certainly contrary to expectation to learn that removal of an organ from an animal and its administration to the animal as food or drug will produce similar results. The whole subject is obscure, and here, as in the case of some other of the ductless glands, it is probable that our experimental technique is too faulty or too limited to enable us yet to draw any just conclusions.

The Testes.—The effects of castration in man have been known for a very long time. The absence of hair from the face, the undeveloped larynx and the persistent soprano voice resulting, and the tendency to gigantism and obesity are among the more striking of the characters of a eunuch. In male stags the antlers do not grow, and in the cock the comb fails to develop. These results do not occur when the vas is tied. In some animals and under favourable conditions these secondary sexual characters may be induced if a testis is transplanted from another animal. So that they must be attributed to an absence of a specific internal secretion.

The elements of the testis which are usually supposed to furnish the internal secretion are the *interstitial cells* of Leydig. These are of an epithelioid character and contain lipoid granules. These structures are not always very striking in sections through the testis, but they are more marked in some animals than in others.

Injection of extracts of the testis was observed many years ago by Brown-Séquard to have a rejuvenating or stimulating effect upon the subject so treated, but it is doubtful whether the effect is specific or more marked than with other extracts.

The Ovaries.—It is well known that if both ovaries are removed from a young animal the uterus does not develop, menstruation does not occur, and the mammary glands fail to grow.

Extracts made from the ovary produce certain effects upon smooth muscle, but it is not certain that these effects are specific.

The *corpus luteum* appears to be concerned with the fixation of the embryo *in utero* and also with the growth of the mammary gland and the secretion of milk. As in the case of the testis there is a tendency to attribute the internal secretions of the ovary to certain *interstitial cells*. These, however, are not present in all animals or at any rate are not present during all periods of the sexual cycle.

Extracts of ovary have been employed in the same manner as those of testis, and the same criticism applies.

The Carotid Body.—Situated at the bifurcation of the carotid artery and consisting, in many animals, of only a few cells, it is not known that the carotid body, or carotid gland, carries out any important functions. Among the constituent cells are a few of the chromaphil variety, and these are capable, presumably, of furnishing a small amount of adrenin to the general circulation.

The Coccygeal Body.—This structure is included in our list because it has been alleged that it contains chromaphil cells. This, however, does not appear to be the case. The body is apparently an arterio-venous anastomosis. (S. V.)

DU MAURIER, GERALD (1873–), English actor, was born at Hampstead March 26 1873, the son of George Du Mau-

rier (*see* 8.658). He was educated at Harrow and first appeared on the stage at the age of twenty at the Garrick theatre, London, then under the management of John Hare. Two years later he joined Herbert Tree at the Haymarket and played with him in Shakespearean plays and his father's play of *Trilby*, as well as in various melodramas. Amongst many later successes may be mentioned his acting in Barrie's *Peter Pan, The Admirable Crichton, Little Mary, What Every Woman Knows* and *Dear Brutus*, and his performances as the hero of Conan Doyle's *Raffles* and of McCutcheon's *Brewster's Millions*. He wrote the play *A Royal Rival*, produced by Lewis Waller, and with his brother, Guy Louis Busson Du Maurier (1865–1915), author of *An Englishman's Home* (1909), wrote *Charles I. and II.*

DUNAJEC-SAN, BATTLES OF THE.—The line of the river Dunajec and that of the San, both in West Galicia, marked the two successive stages in the break-through battle which initiated the Austro-German offensive of 1915 on the eastern front.

After the severe fighting on the Carpathian front (*see* CARPATHIANS, BATTLES OF THE) there ensued a pause in the second half of April 1915, both on the side of the Central Powers and on that of the Russians, whose attempts at a break-through had failed. Fighting continued only in the sector of the German Southern Army up to the end of the month, the crowning day being April 24, when Hofmann's Austro-Hungarian corps stormed the Ostry heights.

The general situation on the eastern front was at this time somewhat unsatisfactory. The Austro-Hungarian armies in the Carpathians were exhausted; the IV. and I. Armies, Woyrsch's Army, and the German forces on the eastern front were certainly holding their ground, but were continually being weakened by having to detach troops to the Carpathian front. The Russians were in similar case; the combats in the mountains had absorbed not only great masses of men but also quantities of material, which could not so readily be replaced. Thus, although the danger in the Carpathians was not yet over, Russian offensive movements on a large scale were hardly to be expected.

The position was far more favourable on the German western front, where the Germans awaited the French attacks with calm confidence, while behind the lines the organization of 14 new divisions was nearing completion. The opportunity for improving the situation in the E. appeared, therefore, to have arrived. The desirability of relieving the pressure on the Carpathian front seemed self-evident, and the only question was as to the direction and method of execution of the offensive. The choice appeared to lie between an offensive on a large scale against the whole Russian front, combined with enveloping movements against its northern and southern flanks, and a direct break-through at some part of the line. For the latter operation the area Gorlice–Tarnów appeared to offer advantages; it had been largely denuded of troops by the Russians during the course of their Carpathian offensive, and a drive on Sanok, via the Jaszlo and Krosno basins, would get into the rear of the Russian forces in the Carpathians and roll them up. The length of time that would be necessary for the preparation of an attacking group in the Carpathians, where the railway communications were very bad, would be bound to militate against the success of the first plan, while an enveloping movement in the N. would be too far distant to have any lasting influence in improving the situation in the Carpathians. West Galicia, on the other hand, was well suited as an area of assembly for an offensive group, and the possibilities of success were highly promising.

The High Commands of both the Central Powers had early in April decided, independently of each other, for the second solution of the problem; indeed, the Austrians had, in the middle of March, undertaken an offensive towards Gorlice with weak forces, which resulted only in a tactical success. When the Austrians early in April renewed their request for German divisions to be dispatched to the Carpathians the whole matter came up for discussion; the preliminary conditions for the offensive were arranged by telegraph, and the final decision was arrived at on April 14, at a conference between the two chiefs of the general staffs in Berlin.

The XI. Army, under Gen. von Mackensen, was organized as a shock group, consisting of eight German divisions from the western front, the two divisions of the Austrian VI. Corps, and the 11th Honved Cav. Div.; and it assembled behind the right wing of the Austrian IV. Army. This latter was also placed under Mackensen, who was himself subordinated to the Austrian High Command. These two armies were to carry out the main attack in West Galicia, while the armies of Dankl N. of the Vistula and those of Boroević, Böhm, Linsingen and Pflanzer were to display all possible activity and engage the enemy in their front so as to prevent him from detaching troops to the main attack. Simultaneously two demonstrations in the Prasznysz and Novgorod areas, and a raid on Memel, were planned.

After the completion of the assembly of the XI. Army, the distribution of the Austro-German forces in West Galicia and the Carpathians was as follows: In West Galicia, on the Lower Dunajec, the heights of Wal, and the Biala as far as Cięzkowice, was the Austrian IV. Army under Archduke Joseph Ferdinand (7 inf. divs.). To the right of this, the XI. German Army, under Gen. von Mackensen (10 inf. and 1 cav. divs.), lay by Luzna and Gorlice as far as Malastów. The Austrian III. Army, under Gen. von Boroević (14 inf. and 2 cav. divs.), stretched from Malastów in a salient curve S. of the Carpathian crest by Zboro to Virava. Thence the Austrian II. Army, under Gen. von Böhm-Ermolli (14 inf. divs.), held its position as far as the heights W. of the Uzsok pass. From here by Zawadka, on both sides of the Orawa and the Oportales, by the Wyszokow saddle to the sources of the Moloda, lay the Southern German Army, under Gen. von Linsingen ($9\frac{1}{2}$ inf. divs.). Next came the Austrian VII. Army, under Gen. Baron von Pflanzer-Baltin ($8\frac{1}{2}$ inf. and 5 cav. divs.), curving on the line Solotwina, Ottynia, Horodenka Zaleszczki, and along the Dniester and the frontier.

On the Russian side there stood in the area S. of the Vistula, and on the Carpathian front, the III. Army (Gen. Radko Dimitriev), the VIII. Army (Gen. Brussilov), the Stry detachment and the IX. Army (Gen. Lechitski)—in all some 40 inf. and 16 cav. divs. with at least 10 Militia Opolchevie brigades.

The Break-through of Gorlice–Tarnów (May 2–5).—By the end of April all the preparatory measures for the offensive were complete, and on May 1 the preliminary bombardment on the front of Mackensen's Army Group began; this was followed at 6 A.M. on the 2nd by four hours' intensive fire by some 1,500 guns of all calibres, on a scale far surpassing anything yet known. The Russian trenches, on which many months' labour had been expended, and which were sited with great skill, were soon so shattered that the infantry, who had advanced to assaulting distance, were able to storm them.

During the night of the 2nd the left-wing group of the IV. Army, the combined division under Field-Marshal-Lt. Stöger-Steiner, forced the line of the Lower Dunajec by a surprise attack, and during the day established itself at Otfinów on the eastern bank.

The vigorous offensive of the XI. Army, in which the Austrian VI. Corps specially distinguished itself, met with little resistance from the Russians, who had been completely overwhelmed by the bombardment. Between Cięzkowice and the heights S. of Gorlice their lines were completely broken through. The Austrian X. Corps, fighting on the left wing of the III. Army, had a large share in this success. By 5 P.M. it had stormed the Russian positions on the heights S.E. of Ropica Ruska, and E. of Malastów, and continued its advance up till a late hour of the night.

The Austro-Hungarian IV. Army, which had to carry the very strong and defensible ridges of Dobrotyn and hills 419 and 402, was also in the end successful, after severe fighting, assisted in some measure by the effect of the XI. Army's break-through. Meanwhile the remaining Austro-German armies kept the Russians on their respective fronts constantly on the alert, and thus prevented any transference of troops; the Russian III. Army alone succeeded in concentrating strong reserves (III. Caucasian Corps and 63rd Res. Div.) in the vicinity of Jaszlo.

The offensive was continued on the 3rd with the utmost energy; the XIV. Corps stormed hills 419 and 402, while the IX. Corps on the right wing of the army captured the heights E. of Gromnik. Up to mid-day the XI. Army met with little resistance; in the afternoon, however, it came up against a series of strong positions, which were not captured till the evening, and its right wing reached Wapienne, the centre Biecz, while the left wing occupied the Lipie heights and the ridge N.E. of Olpiny. The left corps of the III. Army stormed Ostra Gora, the Russians in front of it establishing themselves on the E. edge of Magura.

By the 4th such rapid progress had been made that it was possible to extend the attack on the whole front of the III. Army.

The Army High Command ordered the XI. Army to continue its advance, with its reënforced southern wing moving in the direction of Dukla–Krosno–Strzyzów, the III. Army's left moving on Tylawa, its centre and right continuing to hold fast the enemy in their front. The time for the assumption of the offensive was to be at the discretion of the army commander himself. The neighbouring army under Böhm was already assigned as a reenforcement of the left wing, to operate in harmony with Boroević's right wing.

The left wing of the IV Army was heavily attacked on the night of the 4th–5th, and little progress was made by it or by the German 47th Res. Div. in the course of the following day. On the other hand, the Russians opposed to the XIV. Corps, in the centre of the IV. Army, fell back before dawn; both divisions of the corps followed them up closely, and by nightfall had reached the line of the Biala. The right corps captured the heights N.E. of Tuchów and Dobrotyn hill. The XI. Army made very rapid progress on this day, driving the enemy back step by step as far as the Wisloka, and establishing itself at Pilgrzymka Osobnica and Olpiny in close touch with the IV. Army.

On the left wing of the III. Army the 21st Landwehr Inf. Div. occupied the heights of Watkowa after heavy fighting.

On the 5th, however, the resistance of the Russian III. Army was still unbroken. The IX. Corps, indeed, captured the heights of Obzar and Wiszowa, thus securing possession of the whole of the Dobrotyn ridge, while Szende's brigade and the 106th Inf. Div., in the face of stubborn resistance, cleared all the area E. of Tuchów as far as Zalasowa and the heights of Trzemesna W. of it, while the 3rd Div. succeeded in crossing the Biala; but the 8th Div., which finally followed the 3rd over the river, and the whole of the northern wing of the IV. Army, were unable to gain any success.

On the right wing of the XI. Army, however, Gen. von Emmich's corps, which had pressed far forward, again met with great success, throwing the Russians back behind the Jasiolka in the direction of Dukla, while the left wing of the army advanced to Jodlowa.

This rapid advance naturally facilitated the task of Boroević's army. As early as the morning of the 5th the front of the XXIV. and XII. Russian Corps, before the centre and left of that army, began to yield. Pursued by the Austro-Hungarian X., XVII. and VII. Corps in the direction of Jasliska and the upper valley of the Laborcza, they were driven into the area W. of Tylawa behind the valley of the Ondava and onto the heights N.E. of Nagybakocy. Only the XXI. Russian Corps held its ground at great cost against the German Beskiden Corps, fighting on Boroević's right wing.

On the N. wing of the IV. Army the enemy's resistance was at length broken on the night of the 6th by the repeated assaults of Stöger-Steiner's Div. and the German 47th Res. Div. While the Russians evacuated their positions below Tarnów as far as the Vistula, the Austro-German troops occupied Tarnów and initiated a pursuit in the area W. of Pilzno.

The right wing of the IV. and the left and centre of the XI. Army had meanwhile reached the Wisloka. Emmich penetrated as far as Wietrzno with his corps, and in the Dukla area blocked all the lines of retreat leading N. and N.E., along which Radko Dimitriev's defeated columns were now retiring in wild disorder. At Tylawa the Austro-Hungarian X. Corps, advancing from the W., encountered the 48th Inf. Div. of the Russian XXIV. Corps under Gen. Kornilov, and, in conjunction with Field-Marshal-Lt. Berndt's Cavalry Div., forced the greater part of it to surrender and scattered the rest, who were captured some days later by Emmich's troops.

By the evening the Austrian XVII. and VII. Corps had reached the Dukla pass and the Laborcza valley, driving before them Radko Dimitriev's broken right wing, which took refuge behind the Jasielka and the Carpathian ridge, leaving behind many prisoners and vast quantities of war material.

In view of these successes, it was to be expected that the Russian XXI. Corps would shortly be compelled to evacuate the Lupków pass which would shake the whole Russian front along the Carpathians to the E. of it. The rolling-up of this line seemed to ensure the complete strategic success of the five days' "breakthrough" battle of Gorlice–Tarnów in which Radko Dimitriev's army had been driven back more than 20 m. on a front of 100 m., with a loss of 50,000 prisoners, 50 guns and much other material.

The Pursuit and Battles at Sanok and Rzeszów (May 6–11).—After his severe defeat, Radko Dimitriev's plan was to hold the Lupków pass with his left wing, and, supported upon this, to bring the pursuit to a stand on the line Nowotaniec-Besko-right bank of the Wislok, where there were positions favoured by the lay of the ground, and then, between the Vistula and the Wislok, on the line Wielopole–Zassow–Malec. Here he proposed to reconstitute his units, which had fallen into great disorder, and to strengthen them by bringing up reserves. Troops were sent to him from other fronts, and by the 8th he could again dispose of 18 inf. divs., 5 cav. divs. and 5 Reichswehr bdes. The orders were that the offensive was to be continued with all possible vigour. Mackensen's army was to push forward over the stretch of the Wislok between Besko and Frysztak on Mrzyglód and Tyczin, and the Archduke Joseph Ferdinand on Rzeszów, while Boroević was to roll up Brussilov's VIII. Russian Army in the direction of Sanok. Böhm's II. Austrian Army was to join up corps by corps from the left wing in proportion to the progress of the attack.

In the course of the 8th the Russian positions were once more attacked along the whole front, and in the sector of Mackensen's army were stormed along the whole E. bank of the Wislok. Both here and in the front of the centre and right of the IV. Army the fighting was heavy; the Russians were driven by the latter from Pilzno and Brzostek and pursued beyond Debica and the hill of Chelm. In front of the newly formed group under Gen. von Kirchbach, composed of Stöger-Steiner's Div., the German 47th Res. Div. and certain Landsturm formations, on the left wing of the IV. Army, the Russian IX. Corps fell back in the afternoon to the new line prescribed.

Meanwhile, Boroević had also pressed the Russians hard and by 3 A.M. forced them to abandon the Lupków pass as well as the strong Bukowica ridge, and to retire to the line Zarszyn-Bukowsko-Szczawne, where they once more took up strong positions. As a natural result of the retreat of the III. Russian Army, the whole of Brussilov's VIII. Army began to give ground, and Böhm's army, with the W. wing of Linsingen's, at once took up the pursuit.

On the 9th, however, violent resistance was once more encountered, particularly on the fronts of the German Southern Army and the Austro-Hungarian II. and III Armies, from the Ostry hill to Besko. The Russian *point d appui* at the latter place was much endangered by the withdrawal of the Russian front fighting against Mackensen to the left bank of the Stobnica; but it was urgently necessary to hold it, as also the strong front Bukowsko–Szczawne, in order to secure Brussilov's undisturbed retreat. Despite a violent counter-attack delivered by three newly arrived divisions astride the Sanok road between Besko and the left flank of the Russian line on the Stobnica, the Russians were forced to abandon Besko on the evening of the 9th.

When on the 10th Böhm's left wing, pressing forward by Baligrod and the San, captured Szczawne, and the gallant X. Corps on Boroević's left took Zarszyn, the strong position of Bukowsko became untenable; and by the evening of the 11th the Russians had fallen back behind the San. The III. Army followed them up to the area Sanok-Zagorcz. Meanwhile the XI. Army had stormed the Stobnica position and advanced its front. Of the Archduke Joseph Ferdinand's army Kirchbach's corps on the evening of the 11th reached the Lower Wislok while the centre took Sedziszow. During the night of the 12th the IX. Corps secured Rzeszów.

The Russians, after some minor rear-guard actions, had also fallen back along the whole front before the II. Army, so that on the 11th the Austrian left wing had reached the Lisko area, while the right had passed the Upper San, where the Southern Army was.

At this point may be said to have ended the battle of Rzeszów-Sanok, the effects of which were quickly seen in the retirement of the enemy line N. of the Vistula. The Russians now prepared to make a fresh stand on the strong defensive line of the San below Przemysl, where they had constructed strong lines of defences, with their flanks resting on the Dniester marshes at Wielki Bloto, and the angle made by the Vistula and the San. Up to this point they had lost 130,000 prisoners, 100 guns and 300 machine-guns.

Events up to the Battle of Przemysl (May 12–23).—The Russians, foreseeing the possibility of a further retreat, had chosen as their next position the line of the San below the fortress of Przemysl, which had again been placed in a state of defence, as far as Nisko, and they had strengthened this line by the construction of bridgeheads at Radymno and Jaroslaw. Below Nisko the line enclosed the angle formed by the Vistula and the San, whence a particularly strong line of defence led to Tarnobrzeg and was continued on the far side of the Vistula to Klimontów and Opatów. The southern front was connected by an equally strong fortified line through Husaków and Krukienice with the Dniester, which served as the next natural line of defence for the Russians. At first, however, they did not make full use of this river as an obstacle, since they advanced their IX. Army against Pflanzer-Baltin to the Pruth.

The immediate object of the Austrian and German High Commands was to force the San below Przemysl, and to attack that fortress. The following objectives were assigned to the armies. The IV. Army was to force the Lower San, and the XI. to pass that river on either side of Jaroslaw. The N. wing of the III. Army was to push forward S. of the San against the W. and S. fronts of Przemysl, and secure that place by a *coup de main*, while its S. wing advanced by Dobromil on Mosciska. To the II. Army was assigned the direction Chyrów–Sambor, while the Southern Army's objectives were Drohobycz and Stryj. The VII. Army was to maintain its positions, while on the N. of the Vistula the armies of Dankl and Woyrsch were to follow up the enemy, with their inner flanks moving by Daleszyce on Slupia.

After breaking off the battle the Russians had rapidly fallen back to the San, and were as rapidly pursued. The pursuers encountered in the main only a few small rear-guards during the next few days; the II. Army, however, had violent fighting at the San crossings; and on the III. Army front, the 27th Div., in conjunction with the German Beskiden Corps, dispersed a hostile rear-guard on the heights of Magiera, S. of Przemysl.

On the 14th the German Guard Corps found itself face to face with the strong fortifications of the bridge-head at Jaroslaw. After a short but intense preliminary bombardment the Guard infantry, assisted by those of Field-Marshal Arz's Corps advancing from the

S.W., stormed the works on the 15th, and on the 16th entered Jaroslaw and crossed to the E. bank of the San.

The IV. Army reached the Russian lines on the Vistula-San angle on the same date, and took up a position on the W. bank of the San as far as the Wislok. S. of the Wislok the XI. Army had established itself on the left bank of the San, in face of the fortress girdle of Przemysl and extending to the San S. of Mackowice; the III. Army aligned itself as far as Husaków before the S.W. and S. fronts of Przemysl, while the II. Army had worked its way forward to the entrenched line extending over Krukienice to the Wielki Bloto. S. of this marshy area the Southern Army had driven Cherbachev's XI. Russian Army back on Stryj and Dolina, which had been formed out of the Stryj detachment early in May. Pflanzer's Army was compelled to withdraw before the Russian IX. Army (Lechitski) to the Pruth between Czernowitz and Kolomea, and there made preparations to hold this line, while coöperating with its reënforced left wing in the offensive of the Southern Army.

N. of the Vistula the Russian IV. Army was forced back by the armies of Dankl and Woyrsch to the line Nowe Miasto-Mniszek-Ilza-Opatów-Klimontów, after heavy fighting in the Czarna and Lysa Gora areas, and small rear-guard actions elsewhere. Before the IX. German Army the Russians held their ground.

In 14 days of fierce battle the Central Powers had gained a great victory, and had pushed back the Russian "steam-roller" some 110 m. eastwards, besides securing 170,000 prisoners, 128 guns, 368 machine-guns and immense quantities of war material.

A pause in the operations now ensued, which was devoted to the preparations for a further offensive, to comprise the forcing of the San line, the capture of the fortress of Przemysl, and the storming of the heights S.E. of the fortress.

The San itself at this season was not a serious obstacle, and its passage presented no difficulties in itself; but on the far bank there existed strong and well-prepared positions, while the Russians had received considerable reënforcements; their front E. of the Vistula having been strengthened by some 9 divs. at the beginning of May. The fortress of Przemysl had been reconstructed by the Russians and was now too strong to capture by a *coup de main.* The bringing-up of heavy artillery would therefore be necessary, and the strong positions S.E. of the Vistula also demanded a carefully planned attack. It appeared, moreover, that the Russians had recovered their breath in this new position, and that they intended to oppose an energetic resistance to the pursuit. Fresh and thorough preparations had, therefore, to be made for the continuance of the attack. The transport of supplies could not keep pace with the troops during their rapid advance, for the Russians in their retreat had carried out a thorough work of destruction. The roads and railways could not be used, and the bridges had been blown up. Only after hasty restoration had been carried out could the necessary heavy artillery and ammunition be sent forward.

As the front became shortened during the advance, the Austrian VIII. Corps was on May 10 taken out of the line on the III. Army front, transferred by rail to the IV. Army, and attached to Kirchbach's group where it was to be assigned the part of storming Sandomierz. The 41st Honved Inf. Div. was also transferred from the III. to the I. Army, coming into line on the 19th at Staszów.

The imminent entry of Italy into the war had no influence on the continuance of the offensive, apart from the fact that the VII. Corps (17th Inf. Div. and 20th Honved Inf. Div.) were entrained on the 21st at Mezö Laborcz for the S.W. front. There was, however, a spontaneous pause during which both sides made their preparations for the forthcoming great battle. The Austro-German troops were engaged on their front in securing favourable conditions for their impending attack, while the Russians endeavoured, in a series of powerful counter-blows, to check the progress of their pursuers and even to prepare the ground for a possible offensive.

The occupation of Jaroslaw early on the 16th, and the construction within the next few days of a regularly fortified bridge-head, in which was included the village of Sieniawa, captured on the 18th by the Austro-Hungarian 10th Inf. Div., afforded a favourable sallyport for the next advance. Despite the gallant counter-attacks of the III. Caucasian and XXIV. Corps, the German X. and Guard Corps and Arz's Austrian Corps were able to consolidate their positions in this sector. The 12th Div. of the last-named corps on the 20th carried out a successful advance towards Radymno. The XI. Army Command, in order to assist the II. and III. Armies, which were making little headway, projected an attack on the 24th with the left flank along the Szklo on the E. bank of the San. If the part played by the Russians opposed to the XI. Army was mainly passive, they showed a more aggressive spirit opposite the IV. Army on the Lower San. Units of their IX. Corps near Misko, and of their X. Corps near Stare Miasto, delivered violent attacks on the 18th, which were defeated. On the 19th, after being reënforced, they again crossed the San between Rudnik and Stare Miasto but had to return hurriedly to the E. bank as the result of a counter-attack by the 3rd Inf. Div. Heavy fighting also occurred near Rudnik, where the 8th Inf. Div. defeated with the utmost gallantry the repeated Russian efforts to effect a break-through.

During the pause in the fighting here, violent fighting took place in the bend of the Vistula on the front of Dankl's and Woyrsch's armies. The pursuit, which had been begun on the 12th by the former army, had been successively taken up by Woyrsch's armies and by Kövess's army group. The right wing of Dankl's army encountered strong resistance on the 16th on the line Koprziwnyca-Klimontów, advanced to the attack but failed to break through; the same fate befell the II. Corps on his left wing, which had to relinquish its initial gains in face of a violent Russian counter-attack. Woyrsch's right wing, which was in touch, was also held up; on his left wing, however, the 16th Inf. Div. took Ruski Brod near the source of the Radomka and drove the enemy back in flight.

During the 17th indications of a Russian counter-offensive between the inner wings of Dankl's and Woyrsch's armies increased in number, and Bredow's div. (Woyrsch's right wing) and the II. Corps actually had to resist a series of violent assaults which, in the case of Dankl's army, even suggested the necessity of a retreat behind the Czarna. On the 18th, however, the expected counter-offensive failed to materialize against Dankl's left wing; the Russians devoted all their efforts on this and the following day to the capture of Bredow's positions, and they also exercised considerable pressure against Dankl's southern wing; all their attacks, however, were beaten off.

On the 20th the main body of the Austro-Hungarian 7th Cav. Div. came into action on Bredow's right, and the 41st Honved Inf. Div. from the III. Army, on the II. Corps' left; and the Russians in this part of the front thereupon fell back before this corps and Bredow's div. to an entrenched position on the line Brody (on the Kamienna)-Wasniów-Kobylany. The pursuers worked forward to this on the 24th. Nothing of moment occurred in the centre and on the northern wing of Woyrsch's army, or on the fronts of Kövess's army group and the German IX. Army.

The Russian attempt to break through in the mountain area N. of Kielce, to relieve the pressure on their retiring troops N. of the Vistula, had thus failed; 6,300 prisoners had been lost.

S. of the Vistula there now began the violent struggle prepared for since the 12th, which in the battle of Przemysl, was to introduce the second phase of the great spring campaign in Galicia.

The Battle of Przemysl (May 24-June 6).—On May 24 the attack by Mackensen's army, which had been planned four days earlier, began along the Sklo in an E. and S.E. direction. At the same time the II. and III. Armies were to advance in a N.E. direction along the Mosciska-Przemysl road, with the object of driving the Russian field army away from the fortress from the S. The IV. Army, securing the San crossing at Sieniawa, was to direct its main effort against the strong Russian positions in the angle between the San and the Vistula about Rudnik and Machów, while the Southern Army was, to continue its attacks in the Drohobycz-Stryj area. As early as the 24th the XI. Army forced back the enemy along all the front of attack. The German XLI. and Austro-Hungarian Corps, on this and the following days, accomplished the brilliant feat of storming Radymno, which the Russians had erected into a powerful bridge-head by means of three exceptionally strong lines connected with the northern defences of Przemysl.

A violent and extremely effective artillery preparation begun early in the morning made it possible to take Ostrów and Radymno on the 25th, and finally for the VI. Corps to capture the bridge-head of Zagrody. The Russians fled over the San in complete disorder. By the premature destruction of the bridge over the river, 21,000 of them were cut off, and fell into the hands of the victors, who also captured 39 guns and 40 machine-guns.

By the evening of the 25th Mackensen's attacking wedge had been driven forward on the E. bank of the San to the line Radwa-Zapalów (on the Lubaczowka)-Laski-Lazy. On the W. bank the Bavarian 11th and German 119th Divs. had already on the 24th reached the heights S.W. of Zablotce. On the 26th the XLI. Corps succeeded in gaining possession of the S. end of Swiete on the W. bank of the San, while the VI. Corps took the villages of Nienowice and Chotyniec. The Guard established itself on the line Zaleska Wola-Zapalów.

The Russians had made every effort to check Mackensen's advance, particularly by means of violent counter-attacks at night, but in vain. Mackensen's advance had progressed so far to the E. that Przemysl was now encircled from the north. He proceeded to consolidate his positions in this area, partly in order to counter a Russian offensive which was just beginning, partly in order to await the moment when the II. and III. Armies should be able to deliver a direct assault on Przemysl from the south.

The right wing of the II. Army and the whole of the III. continued their attacks on the 24th with the utmost energy. On the previous night a Russian counter-attack had pressed the XVIII. Corps back a little, but on the morning of the 25th the position was restored, largely owing to the arrival of the 13th Landwehr Inf. Div.

Field-Marshal-Lt. Schmidt's group (7th Inf. Div. of the IV. Corps and the XVIII. Corps), attacking on the left wing against Mosciska, gained some small successes, but the German Beskiden Corps farther to the left made no advance on this day. On the 26th it was able to storm two hills near Husaków, but as against this all the efforts of Schmidt's group broke down before the strong Russian positions, which were in part concreted and consisted in places of seven successive lines of trenches. Owing to the lack of heavy artillery the attack here could progress only by systematic

The Army High Command ordered the XI. Army to continue its advance, with its reënforced southern wing moving in the direction of Dukla–Krosno–Strzyzów, the III. Army's left moving on Tylawa, its centre and right continuing to hold fast the enemy in their front. The time for the assumption of the offensive was to be at the discretion of the army commander himself. The neighbouring army under Böhm was already assigned as a reenforcement of the left wing, to operate in harmony with Boroević's right wing.

The left wing of the IV Army was heavily attacked on the night of the 4th–5th, and little progress was made by it or by the German 47th Res. Div. in the course of the following day. On the other hand, the Russians opposed to the XIV. Corps, in the centre of the IV. Army, fell back before dawn; both divisions of the corps followed them up closely, and by nightfall had reached the line of the Biala. The right corps captured the heights N.E. of Tuchów and Dobrotyn hill. The XI. Army made very rapid progress on this day, driving the enemy back step by step as far as the Wisloka, and establishing itself at Pilgrzymka Osobnica and Olpiny in close touch with the IV. Army.

On the left wing of the III. Army the 21st Landwehr Inf. Div. occupied the heights of Watkowa after heavy fighting.

On the 5th, however, the resistance of the Russian III. Army was still unbroken. The IX. Corps, indeed, captured the heights of Obzar and Wiszowa, thus securing possession of the whole of the Dobrotyn ridge, while Szende's brigade and the 106th Inf. Div., in the face of stubborn resistance, cleared all the area E. of Tuchów as far as Zalasowa and the heights of Trzemesna W. of it, while the 3rd Div. succeeded in crossing the Biala; but the 8th Div., which finally followed the 3rd over the river, and the whole of the northern wing of the IV. Army, were unable to gain any success.

On the right wing of the XI. Army, however, Gen. von Emmich's corps, which had pressed far forward, again met with great success, throwing the Russians back behind the Jasiolka in the direction of Dukla, while the left wing of the army advanced to Jodlowa.

This rapid advance naturally facilitated the task of Boroević's army. As early as the morning of the 5th the front of the XXIV. and XII. Russian Corps, before the centre and left of that army, began to yield. Pursued by the Austro-Hungarian X., XVII. and VII. Corps in the direction of Jasliska and the upper valley of the Laborcza, they were driven into the area W. of Tylawa behind the valley of the Ondava and onto the heights N.E. of Nagybakocy. Only the XXI. Russian Corps held its ground at great cost against the German Beskiden Corps, fighting on Boroević's right wing.

On the N. wing of the IV. Army the enemy's resistance was at length broken on the night of the 6th by the repeated assaults of Stöger-Steiner's Div. and the German 47th Res. Div. While the Russians evacuated their positions below Tarnów as far as the Vistula, the Austro-German troops occupied Tarnów and initiated a pursuit in the area W. of Pilzno.

The right wing of the IV. and the left and centre of the XI. Army had meanwhile reached the Wisloka. Emmich penetrated as far as Wietrzno with his corps, and in the Dukla area blocked all the lines of retreat leading N. and N.E., along which Radko Dimitriev's defeated columns were now retiring in wild disorder. At Tylawa the Austro-Hungarian X. Corps, advancing from the W., encountered the 48th Inf. Div. of the Russian XXIV. Corps under Gen. Kornilov, and, in conjunction with Field-Marshal-Lt. Berndt's Cavalry Div., forced the greater part of it to surrender and scattered the rest, who were captured some days later by Emmich's troops.
